

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 157. NEW SERIES.

SATURDAY, JANUARY 2, 1847.

PRICE 1½d.

THE SUPERNUMERARY CLASS.

In walking through the streets of a great town, one might suppose it an easy matter to classify, at least in a general manner, the industrious inhabitants. From the grave merchant to the busy shopkeeper, and from him to the lowest stall-vender, all have their peculiar avocations; nay, even the street beggar may seem in some way to belong to the category, since mendicancy is with him a regular profession. But, after having appeared to go through the whole circle of industry, we still find a busy and numerous class left out, which it is impossible to place under any of the heads we may have imagined. They have no trade, no tools, no masters, and yet are never idle when they can help it; they have no home, no family, no friends, and yet rarely want a meal and a bed; they have no functions, no duties, no privileges of citizens, and yet are integral portions of the community to which they belong, and come in various ways into social and business contact with their fellows.

In London they form a portion—but only a portion—of that class whose name the statisticians tell us is Legion, who rise up every morning without knowing where or how to get their breakfast. In this numerous tribe, however, are included beggars, thieves, and others who look to the chances of their disreputable professions; whereas the individuals we allude to are not necessarily dishonest or ill-conducted, and have no calling whatever. They have nothing to do, but are willing to do anything; they have nowhere to go, but will readily go anywhere; they trust entirely to the chapter of accidents for their daily bread; and when they lie down at night, without a farthing in their pockets, and without a claim upon the pallet they occupy extending beyond the next morning, they congratulate themselves on having eaten and drunken throughout the day, and look forward with confidence to the morrow.

I have said that they are not necessarily dishonest; but occasionally, when hard pressed, they have recourse to expedients that have little beyond ingenuity to recommend them. The morning, for instance, is a trying time, when the appetite is good, the air keen, and all those classes still in bed with whom it is possible to transact business without capital. It is necessary to begin the day; but how is it to be begun by one who has no money, no calling, no credit, who will not steal, and who is ashamed to beg? Then must come the expedients I have hinted at; and one of these I can relate from personal observation, since it is to it I owe my knowledge of the hitherto unclassified species I would describe.

One morning, then, in the course of an early walk on the New Road, I was stopped by a group of passers-by, who had gathered round a young man engaged in rather

a singular occupation. He wore a sleeved waistcoat and small-clothes, and might have been taken for a groom long out of place. His hat lay upon the ground, and he was busy filling it with small stones from a heap at a little distance, walking rapidly, but not running, between the two points, and with such an earnest and anxious expression of countenance, that I could not refrain from asking what was the matter.

'A bet!' was the reply; and the bystander I had addressed bestowed upon his ignorant questioner a momentary glance of mingled surprise and contempt. He seemed, like the rest, to be an operative in some manufactory; and after an obvious struggle between his sense of duty and curiosity, laid down several halfpence near the hat, in token of his approbation of the young man's activity and of his good wishes for his success, and hurried away. This example was speedily followed, though less liberally, by one or two others of the group, for the hour forbade any dallying, and I at length found myself alone with the stone-picker. He looked at me for an instant, and then along the road; but there being no appearance of any more customers worth waiting for, he picked up the halfpence, shook the stones from his hat, and clapping it on his head, like a man who has got well through some laudable employment, walked off. But I was not disposed to part with him so easily.

'So you have won your bet?' said I, overtaking him; 'and you are now, I presume, for breakfast?'

'Not yet,' replied he after a moment's hesitation, during which I could see him scrutinise me from head to foot; 'what is fourpence-halfpenny? How do I know that anything else will turn up between this and dinner-time?'

'What do you mean to do, then, to increase the sum? Do you mean to make another bet with yourself?'

'No, no; that is well enough in its way when there is nothing else to be done; but I have now got a capital to begin the day with. There are worse dodges than picking up stones; but it is not respectable. I will turn these browns, master, into a white shilling before long, if I once make up my mind what lay to go upon.'

'I will put you upon a plan,' said I: 'tell me how you live, and where you live—give me a distinct notion of what you do to earn your bread for the whole day, and you shall have the shilling without further trouble.'

'That would not be so easy,' replied he, 'as picking up stones. Bless you, I live now and nowhere, and I earn my bread just as it happens!'

'Then tell me *how* it happens: give me the history of a single day, so that it be a common day, and I shall not grudge the money.' Upon this hint he spake; and I am able, from the conversation that ensued, to make a somewhat curious, though melancholy contribution, to the history of social life.

This young man, who may be taken as the repre-

sentative of his class, rises in the morning without a farthing in his pocket, without more clothes upon his back than are necessary for the purposes of decency, without property of any other kind in the world, and without a home to return to after passing the threshold of the one which had sheltered him the night before. Forth he goes, notwithstanding, with an assured look, an elastic step, and a heart full of the buoyant feelings of morning. If you ask him whither he is going, he will reply 'Nowhere.' His walk, in fact, has no determinate direction, and appears to have no termination. His quick, observant glance wanders on all sides in search of something—he knows not what. But something does not come. The air is crisp. The houses have a cold, clear look, and their roofs are well-defined against the light gray sky. London is not now the conventional city of authors and painters, but an assemblage of the most remarkable streets and squares in the world, surrounded by the most transparent of atmospheres. Not a thread of smoke is seen above the countless houses; and the sun has already been able to exorcise the misty shapes that during the night had haunted the river, which now rolls in a smooth, bright, cheerful volume. The strange and almost awful silence which had brooded for several hours over the huge metropolis is broken. Groups of workmen pass by, their deep hoarse voices echoing in the empty streets; and here and there, in all the principal thoroughfares, the breakfast-stalls, set out with snowy table-cloths, smoking coffee urns, and huge slices of bread and butter, have fairly commenced business.

It is these last adjuncts of the picture which, to confess the truth, attract most of our supernumerary's attention; and his interest in them increases as the morning wears on. They began to appear with the earliest peep of day, and will vanish when the streets are once more thronged with their busy population. On the present occasion, it is probably with some feeling of envy he sees numerous workmen regaling themselves *previous* to commencing their daily labours. For his part, he has to search for work before he can commence it; and at length, in hopelessness and hunger, he has recourse to the 'dodge' I have described.

Passing over his paction with myself as something out of the usual routine, we must now follow him through more familiar occurrences. Walking loungingly along the street, he is seen glancing down the areas, and entering into chat with the housemaids, who have just opened the window-shutters. Business does not present itself all at once; still it is some amusement to converse on things in general with these young ladies, whom he styles 'ma'am,' and treats with much deference; while, on their part, they are occasionally not loath to bestow a few condescending words on a likely young fellow, though so far beneath them in station. But at length an opening for trade occurs. In some house or other there is sure to be broken glasses, bones, bits of useless metal, rags—anything, in short, of an utterly useless nature—which Susan will not object to take a trifling sum for, rather than be at the trouble of throwing them into the dust-bin; and having expended his capital on such merchandise, the young man hastens away to sell it at a profit to the wholesale dealers.

He is now able to breakfast; and walking being no trouble to him, he does not scruple to go a considerable distance to a favourite stall, where the coffee is always hot, and the bread and butter always thick. Here the tables are turned, for he has not to beg the lady to sell. He calls her 'mother;' and in addressing him, she says 'Yea, sir,' and 'No, sir.'

As the day advances, he betakes himself to the localities where gentlemen are usually to be seen on horseback; for he places considerable dependence upon the service he may be able to render in holding a horse while the rider dismounts. It is this part of his resources, which influences his choice of a dress, when it is possible for him to exercise any volition upon such a

subject at all. He makes himself as like a groom in appearance as he can; for a groom must be supposed to be an adept at holding a horse. The remuneration is always silver; and, upon the whole, he is not displeased at the substitution of fourpenny-pieces for sixpences, having the sense to observe that there have been a great many more horses to hold since the reduction of the cost. Still it is a hard service; for he has to hunt his prey from street to street, and sometimes, after all, the inconsiderate rider does not dismount till he gets home.

Towards the afternoon, the leading thoroughfares of the west end are thronged with beauty and fashion; for although it is not quite proper for a lady of any distinction to go out, except in her carriage, after twelve o'clock, she has the privilege of walking in certain streets while the vehicle waits. The influence exercised by this class of the community upon the supernumerary is very remarkable. He watches anxiously over every disarrangement of their dress, warning them, when necessary, that they are in danger of dropping their collar or their boa, and being ever at hand to pick up the article should it actually fall. Sometimes he receives only a sweet smile for his politeness: he would rather have sixpence. But, in the meantime, he is far from neglecting the gentlemen, whom he frequently admonishes to take care of their handkerchief. It is said he sometimes pulls it out of the pocket himself a little farther, in order to give colour to the admonition; but for my part I am willing to believe, if he does so, it is only to convince the proprietor more emphatically of his carelessness. In Paris, however, the supernumeraries, I admit, are not guiltless of analogous dodges; for I was myself the victim of one when passing along the side of the Champs Elysées, next the Avenue de Neuilly, where there is a barrier of posts to prevent horsemen from intruding on the footpath. These posts are *always* newly painted, and an artist is in waiting, at a few yards' distance, to rub your smeared akirts with turpentine!

It is not improbable that the young man may earn enough by such philanthropic exertions to authorise a visit to the a-la-mode beef-shop, where he dines luxuriously on soup, meat, and bread for a sum varying from three to five, or even more pence, according to appetite or funds. But this is not always the case; for he has numerous rivals; and wet weather, when it occurs, is a great damper to his prospects. Still he is fertile in all kinds of expedients. He will sometimes even have recourse to an execution, or anything equally horrid, and hawk the history of the affair along the streets. In this case, so far from fearing the interference of another, he always assumes a partner; and the two, taking different sides of the street, bawl out the same words in such a way as to render each other alarmingly unintelligible. In winter, the supernumerary fares a little worse than in summer, there being more bad weather in the former season; and there is reason to believe that he and his brethren are sometimes forced to get up the melancholy cortège of 'froze-out gardeners, who perambulate the streets with a cabbage-stock for an ensign. It is also affirmed that, on the 1st of May, and for several days after, he performs the part of Jack-in-the-Green, who is supposed by the deluded population to be an actual chimney-sweeper; and that, on the Gunpowder-Plot day, he masquerades as one of the bearers of that gigantic Guy who is carried about in a handbarrow in quest of halfpence.

These, however, are but occasional expedients, and I must return to his ordinary day. The chances of the twilight are not great for an honest supernumerary; and indeed he may be said to retire from the streets at the same hour with the upper classes when they go home to dinner. He reappears, however, somewhat earlier; for the playgoing bustle could hardly take place without his having some hand in it. He purchases, on speculation, a quantity of bills; but he is no more a bill-seller at the doors of the theatres than he is a bill-sticker.

MALBY'S IMPROVED PLANISPHERES.

Compiled from the Celestial Globes of the Society, which at one sitting can be made to exhibit the state of the heavens at any minute of any day of the year, on card-board, 18-inch, price 10s.; in a frame and varnished, 18s. 6d.; 9-inch, on card-board, 3s. 6d.

These are regular businesses, to which the parties apply themselves as systematically as shopkeepers do to theirs; while the supernumerary gives himself up, as usual, to his erratic habits. He meets your carriage a full mile from the place of resort, runs by its side at the risk of life and limb, and flashes his bills in at the window. If you buy the wrong one, it is no fault of his; and if you buy any at all, you cannot think (at least if there be a lady with you) of taking change out of your sixpence.

From the time the theatres are full, his exertions for the good of the community begin to slacken, and he rather takes business as it comes, than makes a business of looking for it. He will still, however, run with tolerable alacrity to open the door of a cab when the waterman is out of the way; although in this case he depends entirely upon the passenger's liberality, as the cabman does not consider himself bound, either in law or honour, to give the customary halfpenny to a stranger. There is, indeed, some mystic tie between the cabman and the waterman which I do not altogether comprehend. By whom is the latter appointed? Through what influence does he maintain his state? These are questions I have often asked; and yet, even now, I can only surmise that he may owe his elevation to office, and permanence in it, to the publican of the stand.

But although the supernumerary feels by this time the need of rest, he is still equal to great emergencies; and on the occasion of a fog, for instance, he displays an energy and perseverance which, in a man who has been running about ever since the first peep of daylight, are nothing less than wonderful. A London fog is not like any other fog in the world. Elsewhere you have an impression, however faint and vague, of surrounding objects. You see clouds instead of houses, spectres instead of trees, and men coming like shadows, and so departing. In London you see nothing, feel nothing, breathe nothing but fog:

'The world is void,
The populous and the powerful are a lump—
Senseless, herbless, treeless, manless, lifeless—
A lump of death—

Darkness has no need
Of aid from them—she is the universe !'

But it is not exactly darkness, for that would be nothing worse than intense night: the fog has a skin-deep semi-transparency, like that of Parian marble, through which you see only a cold, hard, impenetrable substance. As you are rattling along in your carriage to a party, without visible horses or driver—with no shafts, no lamps, no tokens whatever of a town, you might fancy yourself transported through the realms of space by the agency of enchantment. And this impression is confirmed, when a flare of lurid light appears suddenly at the window, illuminating a set of odd anxious features—a spectral face without body, which, after glaring at you for an instant, disappears. This apparition is the supernumerary with his link; and if the fog were only a little thinner, you would see his brethren flitting about in troops—some gliding by the houses' heads, some stretching forth a welcome to a bewildered traveller who, in madly attempting to cross the street, has lost his way, but all engaged in such works as befit the friendly goblins of the night. By and by there comes a crash; your carriage has come into collision with another, and a score of ghostly links are instantly upon the spot, and you are able to see the frightened face of the lady in the opposite vehicle, who, arrayed as she is in ball costume, looks like some fairy princess arrested by genii upon her travels. The scene is heightened by the voices of choruses. In London everything is done in a hurry; and in the midst of din of every kind, pierced here and there by shrill screams, you arrive at your destination, and, with a hand under each of your arms, find yourself flung into the hall. Faint, giddy, stunned, and dazzled by the blaze of light, you stagger, from the door to the staircase; and as your name heralds you, you can hardly recognise it for your own, in the con-

fusion of your senses, till you find yourself in the accustomed blaze of the drawing-room, in the midst of a brilliant party, who appear utterly unconscious that there is such a thing as fog in the world.

And the supernumerary? He has disappeared from our ken in the fog. With his public life ends his recorded history; and even I could not venture with certainty upon more than one other fact—namely, that however great his earnings may have been during the day, he never enters the house he selects for his lair with more money in his pocket than the twopence he requires to pay in advance for the accommodation.

This is a melancholy picture, view it in what light we will. There is sadness mingled even with the smile with which we watch his endless expedients; and the sadness is the greater, that we know the picture to be true not merely of a few individuals, but of a numerous class. What effect the advancement of education and enlightenment may have upon this class, one can hardly surmise. We may hope that its members, for the time being, may be gradually absorbed into new openings for regular industry; but the probability remains that their places will be filled with others at least for a long space to come; for it can hardly be expected that the working population of so vast a metropolis will, even in our surprising day, receive an order and arrangement which will leave behind no—Supernumeraries.

THE DOCTOR'S FAMILY.

A STORY OF THE NEW YEAR.

IN the country towns and villages of England there is not, from January to December, a merrier festival than the New Year. In London, and in those large commercial towns which ape the Great Metropolis, it is not so. There Christmas, with its accompaniments of plum-pudding and mince pie, is all in all to the holiday lovers. The Old Year steals out, and the New Year creeps in, like a neglected friend or a poor relation after its more honoured predecessor, glad enough to pick up the crumbs and fragments of the latter's feast of welcome. No one seems to care about the New Year in London. A few peals rung at midnight by the church bells tell to some wakeful invalid or late reveller that the Old Year, with all its hopes and its pains, has gone by for ever; and perhaps next morning some man of business looking over his diary, or some lady glancing at her pictured almanac, remembers the fact; or friend meeting friend in the street just turns to wish 'a happy New Year;' but that is all. Christmas is gone by, with all its feasting and merry-making; and no one cares to welcome New-Year's Day.

But in the rural districts of England, and throughout Scotland, it is very different. There the festival of New-Year's Day is of as great importance as that of old father Christmas himself. Young people look forward joyfully to 'dancing the Old Year out and the New Year in.' It is held unlucky that the New Year should first dawn upon sleeping eyes; so in every house all sit up until midnight to let the young stranger in. Then, as the clock strikes twelve, the family and guests rise up and go in a mingled and noisy procession to the hall-door, which is opened with formal solemnity by the host; and thus the New Year is 'let in.'

It was New-Year's eve in the family of Dr James Renwick. They were keeping it merrily, as befitting the good old times, though it was not many new years before this one of 1847 (May blessings attend those whose eyes meet this, says the writer in a parenthesis—wishing to all a happy New Year)! But before we enter Dr Renwick's mirthful house, let us describe its exterior—and not entirely from imagination.

The doctor's house was at the entrance of a little village, situated just on the bounds of a manufacturing region, yet far enough in the country to make it pleasant and quiet without being dull. It stood on a turn of the road, the steep declivity of which was overlooked by its high garden walls. Over these walls many and

many a time peeped children's curious faces, and little mischievous hands often dropped down flowers and pebbles on the stray passers-by. On the other side of the road a raised pathway led to the church—a Norman erection, old and quaint enough to charm Dr Dryasdust himself. In the churchyard was a village school-room, like a barn, and from thence rushed out daily a small troop of children, chasing the sheep that fed among the graves. Dr Renwick's was the great house of the place; rich in the glories of a gravel entrance and bay windows; and oh, such an orchard! Never was seen the like for apples and pears! But now it looked cold and stately in the gloom of a December night—starry, but moonless. A light covering of hoarfrost lay on the green plot, where, in early spring, snowdrops and crocuses peeped out from the grass, looking prettier than they ever do when set in the cold brown mould of a garden bed. A warm light streamed over the gravel walk through the half-drawn crimson curtains. Any passenger on the road would have said there was mirth and comfort within.

And so indeed there was; for it was the yearly gathering of the Renwick family, of which Dr James Renwick was now the eldest son. Three generations were met once more in the eyes of the doctor's aged parents, who lived with him. They were now too old to have the care of an establishment of their own; and therefore this year the family meeting was held at Dr Renwick's house, where they were spending the decline of life with their good and dutiful son.

Contrary to general English usage, the yearly gathering of the Renwicks was not held on Christmas-day. This was partly because old Mr Renwick thought the day too much of a religious festival for frolic and sport. He had come from the land where his namesake preached, lived, and died among his persecuted brethren; and though Mr Renwick had been so long in England, that the memory of the heathery mountains and braes of his native land was like a dream, still he clung a little to the ways of his forefathers. Besides, it was on one Christmas-day that death had first crossed his threshold, and carried away their eldest born from the young parents, with bitter tears. It was many years since; but still they felt that to have merrymaking on that day would be treading in the shadow of a sorrow now gone by; so the day had ever since been changed from Christmas to New-Year's eve.

Mr Renwick and his wife had been blessed with many children. Their quiver was full of arrows; and they did not murmur at it. Out of ten sons and daughters, five were with them that day; some wedded, with children of their own; one was travelling in foreign lands; and three had gone the way of all before them. But the parents did not count these lost. One only—though living—had been, and, to use the touching words of a father of old, 'was not.'

Dr James Renwick was the worthy son of a good father, and well did he occupy the station and fulfil the duties of a country physician. These duties are very different from those of a London practitioner. In a village 'the doctor' is an important person, second only to the clergyman. He has more to do than merely to heal the bodies of his neighbours. If he be respected, he knows all the affairs of the parish; it is he to whom all come for advice in distress; he is the mediator between helpless poverty and benevolent but cautious wealth; and much good or much evil may he do, as his will leads him. Dr Renwick was a good man, and he was accordingly respected. He had married early a wife of like feelings to himself, and they had brought up a rising family, the elder branches of whom were now men and women. Two brothers and a sister of the doctor were also round his table with their flock, few or many as it might be; so that the grandfather and grandmother looked on a tribe of juveniles as various in years, and name, and appearance, as ever clustered round the chair of age since the patriarchal days.

Mr and Mrs Renwick sat beside the fire, looking

cheerfully around them. A dozen or more young cousins were dancing to the music of a piano and flute, while the elders played whist in an inner room. One or two quiet couples stole away into corners; they were too happy to dance and laugh with the rest. Among these was Isabel Renwick, the doctor's youngest and unmarried sister. The old parents looked at her as she stood with her betrothed in the shade of the crimson curtains.

'We shall have another fine tall son-in-law by this time next year, Letty, my dear,' whispered the old man to his wife with a merry smile.

'Don't talk nonsense before the children,' answered Mrs Renwick, trying to frown as she wiped her spectacles.

'Well, I always thought little Bell was the prettiest of all our children, and she will marry best, though last,' said the proud father. 'Little Bell' was a beautiful young woman of seven-and-twenty, whom no arguments could hitherto induce to quit her father's roof, until an old playmate returned from India, rich in money, and richer still in love, that time could not change. So Isabel was to be married at last.

The dance ended, and the various grandchildren sat down to rest, or walked idly about, arm-in-arm, talking and laughing.

'Do you know what a grand ball Aunt Hartford is giving to-night at the Priory?' said Jessie Renwick to her cousin William Oliphant.

'I doubt if they will be half so merry as we, nevertheless, with all their grandeur.'

'Who is speaking about Mrs Hartford—of my eldest daughter?' said the grandfather sharply. 'Would that she had been no daughter of mine!'

'Hush, John, hush!' whispered his aged wife, laying her withered fingers on his arm.

'Jessie only said that there was a grand party at the Priory to-night,' answered young Oliphant, for his cousin had shrunk aside, alarmed at her grandfather's harsh tone, so unusual to him.

'Let her go with all her pride and her gaieties! There is no blessing on an ungrateful child,' said Mr Renwick sternly. 'When she was born, her mother and I rejoiced, and we called her Letitia in our gladness; but she has been to us a bitter sorrow, and no joy. Do not speak of her, my children.'

The young people saw that there was deep sadness on their grandmamma's face, and that Mr Renwick's tone, though severe, was tremulous; so they did not again mention Mrs Hartford's name. The younger ones wondered; but many of the elder cousins knew of their aunt's great wealth, suddenly acquired by her husband's speculations; and how with wealth had come pride, and with pride coldness and disdain, so that at last Mr and Mrs Hartford were self-exiled from the family circle, and only known by hearsay to the children.

After a season, the slight shadow which poor Jessie's unlucky speech had thrown over the circle passed away. William Oliphant, ever thoughtful in those little things which make the sum of home-happiness, adroitly brought to his grandmother's chair the two youngest of the flock, Mrs Walter Renwick's bonnie little girl and boy, and the old lady's attention was diverted. She took Bessie on her knee, and told Henry a fairy tale, and thought no more of her own lost daughter. How much good had been done by this unnoticed *ruse* of kind William Oliphant!

Merrily passed the closing hours of the Old Year. The children danced again, and then Aunt Isabel was intrusted to sing, and the plaintive music of her voice changed the laughter into a pensive but pleasant silence. After a minute or two they all thanked her cheerfully. They did not know—the careless children!—that of all the merry troop around her, Isabel had sung but for one, and to one. After a while the mirth grew noisier; the light-hearted troop would chorus Aunt Isabel's songs; and so those who could sing, and those who thought they could, all chimed in together, to the utter con-

fusion of treble, tenor, and bass. But there was so much happiness and harmony in their hearts, that no one cared for a little musical discord.

Supper came, for 'not even love can live upon air.' Abundance of mirth was there amidst the good things, particularly when the splendid dish of *trifle* came on, and little Bessie Renwick got the ring, and Aunt Isabel the ill-omened sixpence! It actually made her look grave for a minute, though, until her lover whispered something that made her smile and blush. There was little fear of Isabel dying an old maid! The time passed so quickly, that only just had the happy circle drank the healths of grandpapa and grandmamma, and grandpapa had returned thanks in a few touching words, which made them grave in the midst of their fun, when, lo! the clock struck twelve!

And now came the grand ceremony. Dr James Renwick rose up with great solemnity of visage. Nothing made them laugh so much as to see the mock gravity of merry Uncle James. Bearing a light in each hand, the doctor went to his hall-door, followed by the whole troop. What a noise and confusion did they make in the narrow old-fashioned passage ycleped the hall! And now, the lights being resigned to the care of his eldest son, Dr Renwick unfastened the bolts, and the door flew open, letting in, besides the New Year, such a gust of biting January night-wind as nearly extinguished the candles, and made the whole party shiver and hasten to the warm drawing-room with great celerity.

Just as Dr Renwick was about to close the door, and retire also, some one called him from without.

'Wait a minute, doctor, pray. I want you, sir, if you please.'

'Some patient, I suppose,' said the doctor. 'Well, come in, friend; it is too cold to stand talking outside.'

The man came in, and Dr Renwick and his untimely visitor retired to the study.

'What has become of Uncle James?' was soon the general cry, and some of the more daring of the youngsters rushed up and down the house in search of him. He was found in the study alone, but he looked very grave, and it was no pretence now.

'I cannot go up stairs again,' he said; 'I have to go out immediately.' The children intreated, and Mrs James Renwick expostulated, knowing that her husband had no patients on his list likely to require him at that time of night; until at last grandpapa sent down to know what was the matter.

'I am sure there is no need for you to leave us in this way, James,' said the old man rather querulously; 'and at least you might tell us where you are going.'

'I had rather not,' said the plain-spoken James Renwick; 'but if you still ask me, father, I will tell you.'

'Yes; tell us now.'

'Well, then, it is to my sister's; to Mrs Hartford's.'

'What business have you with her?' cried the angry old man; 'what have you to say to the grand party?'

'There is no gaiety at the Priory to-night, but much sorrow,' answered Dr Renwick gravely. 'Arthur Hartford met with a dreadful accident this afternoon; he is still insensible, and his mother is almost frantic by the bedside of her only son.'

There was a gloomy silence over the party at these words. Old Mrs Renwick began to weep; but her husband said harshly, 'She deserves it; and yet I am sorry. I always heard good of young Arthur. Did she send for you?'

'No; only old Ralph—you remember him—came to tell me; and he begged me to go, for both Mr and Mrs Hartford are almost beside themselves with grief, and the doctor they have knows nothing at all.'

'You shall not go, James Renwick; no child of mine shall enter that ungrateful woman's doors without being intreated to do so,' said the old man.

Dr Renwick had been accustomed all his life to render obedience to his father; often, indeed, to a degree very unusual in a son who had himself become the head of a family. Even when the old man's commands were

harshly and unduly expressed, the good doctor seldom showed any open opposition, so strong was the force of habit and of filial respect. Therefore he now only said, 'Father, have you thought what you do in saying I shall not go. The boy has no proper assistance; he may die, and then—'

Mr Renwick's stern lineaments relaxed a little of their expression, but he made no answer. Then his aged wife took his hand, and looking at him with swimming eyes, said mournfully, 'John, remember when our own Arthur died twenty years ago; if any one had kept help away from him then! And Letty was his favourite sister; and the boy is our own grandchild, and named after him too. John, dear husband, do not be harsh; let James go!'

Many others joined their imploring voices to the aged mother's, and Mr Renwick was softened; but still he would scarcely yield his authority.

'I will neither say yea nor nay; let James do as he pleases: I will hear no more of this.'

Dr Renwick stayed not a moment, lest his father's mood should change, but was gone on his errand of mercy.

There was no more merriment for the young people that night; they were all too deeply touched. The aged pair soon retired, and the various families departed to their several homes. In an hour all was quiet in the doctor's house. Mrs James Renwick alone sat waiting her husband's return, and thinking over in her kind heart how this might end. Every other eye was sealed in repose save one, and that was the aged mother's.

On New-Year's morning the family met as usual; Dr James Renwick looked pale and careworn, but he did not speak of his last night's visit. The grandfather did not allude to it neither, and no one else dared mention the subject in his presence. At last the children separated to their various avocations, and Mr and Mrs Renwick were left alone with James and his wife. There was an uneasy silence, broken only by the clicking sound of the old lady's knitting, which she pursued busily, though her fingers trembled, and several heavy tears dropped on the work. At last the doctor rose and walked to the window, observed that it was a gloomy day, and began searching for his gloves.

'Before you go out, James,' said Mrs Renwick, with an evident effort at unconcern, 'you might as well say how that boy is?'

'You mean poor Arthur? He is better. I think he may recover.'

'Thank God for that!' murmured the old lady fervently.

'Did you see Letty—Mrs Hartford I mean?' asked the father after a pause.

'I did,' answered the doctor concisely.

'Dear James, tell us all that passed?' whispered the poor old mother. Mr Renwick turned over the pages of a book, but he made no opposition; while the doctor sat down beside his mother and began to tell his story.

'When I reached the Priory, all was confusion. Poor Letty was in violent hysterics. I heard her screams the moment I entered the house, so I knew it was of no use asking to see her. The father, they told me, was hanging over his insensible boy. I sent word to him that I had come to offer what assistance I could; and he was with me in a moment, wringing my hands, and imploring me to save poor Arthur. I never thought how misery could have bent the man's proud spirit. Mr Hartford, who passed me but yesterday without a glance, would now have knelt to intreat me to forget the past, and do what I could for his son.'

'And you did—you were successful, James?' said old Mrs Renwick anxiously.

'Yes; after a time the boy came to his senses: he is a fine fellow! He knew me directly, and looked so joyfully from me to his father, who had clasped my hand in overpowering gratitude.'

'And poor Letty?' again asked the weeping mother.

'When she was a little calmer, I went to her with

Mr Hartford. She started at seeing me; but her husband said, "Letty, you must thank your brother for saving Arthur's life." And then she threw herself into my arms, and poured forth such a torrent of thanks, and blessings, and self-reproaches, that it almost made a child of me. Poor Letty! she is much altered," added the good doctor, his voice growing husky as he looked steadily into the fire.

All this time the stern old father had not uttered a word.

For a few minutes none of the party spoke. At last Mrs Renwick glanced timidly at her husband, and whispered, "Did she say anything about us, James?"

"Yes, mother, she asked after you both, said how glad she always was to hear of you in any way, and wept much when she spoke of you."

Mr Renwick lifted up his head; he had bent his face on his hands lest they should see the working of his features, and said, "What truth, think you, is there in that woman's tears, when, not a week since, she passed her old father and mother in the road; she riding in her splendid carriage, and the mother that bore her trudging wearily on foot; and she never looked towards us, but turned her head another way? Do you think I can forgive that, James Renwick?"

"I have forgiven her, John," said the old lady. "She is our own child, and she is in trouble; she may repent now for the past."

"I know she does," added James earnestly. "She told me how she longed to see you; even her husband seemed sorry: he speaks kindly to her, though people say he is so proud."

"And they expect that your mother and I will go humbly to their fine house?" cried the still incensed old man.

"No, father; that was not what my sister said. She told me to say she prayed you to forget the past, and let her come and see you here, and be your daughter Letty once more."

Dr Renwick stopped, for he saw that his father was actually weeping. James looked at his wife, and she left the room. For several minutes the aged couple sat with their hands clasped together in silence; then Mr Renwick said in a broken voice, "Tell Letty she may come."

"She will come—she is come! my dear father," cried James as the door opened, and Letty flung herself on her knees before her parents, and was clasped to both their hearts with full and free forgiveness. The erring child was pardoned—the lost one was found!

Dr Renwick and his wife went silently away together, with full and thankful hearts for the good which had been effected that day. It was their best reward.

There was deep joy throughout the whole of the Renwick family when they heard the news. Some of the younger and gayer spirits thought how pleasant it would be to visit now at Aunt Hartford's beautiful house, and ride Cousin Arthur's fine horses, when he recovered. But with more sincerity and disinterested pleasure did the elders rejoice that there was now no alienation to pain their aged father and mother in their declining years, but that they would now go down to the grave in peace, encircled by a family of love.

Arthur Hartford recovered speedily under his uncle's care. He was indeed a noble boy, resembling, both in person and character, the lost Arthur; so no wonder that he soon became the darling of the grandparents. The leaves were hardly green on the trees before there was a joyful family meeting; for it was the wedding of Aunt Isabel; and there were now no absent ones to mar the happiness of the festivity, for even the sailor had returned.

"That speech of yours turned out not so very unlucky after all," whispered William Oliphant to his cousin Jessie, who hung on his arm, as of old: they were always great friends.

"No," answered the laughing girl; "I dare speak of Aunt Hartford now without fear."

"And see how happy grandmamma looks! I heard her say that Aunt Hartford was almost as handsome as the bride, though I think Aunt Isabel is much superior."

"Well, never mind, William; we are all very happy; it has all turned out like a fairy tale; and I am sure we can say with truth that this has been for us all a happy New Year."

THE FOREST OF ARDEN.

EVER since I first perused that most delightful play of Shakespeare, 'As You Like It,' the very name of which calls up visions of woods and brooks, and all the poetic charms of sylvan life, I entertained a longing desire to visit the Forest of Arden; but it was not till last year that I found time for this pilgrimage to a scene consecrated by our great English dramatist. Arden, or, as it is now called, Ardennes, is a district in the southern and little-frequented part of Belgium. Travellers pouring towards the Rhine leave it on the right, and unless penetrated for a special object, this interesting region remains untouched by the wandering tourist.

It is not without good reason that Arden has been little frequented by strangers. The scenery is mountainous, wild, and curious in the extreme, but has no pretension to the sublime; and from the irregularity of its surface, it does not afford the opportunity for that rapid transit which English tourists in particular so much prize. Yet to those who can afford to spend a fortnight loitering amidst its woods, dells, and antique towns, what scene could be more productive of pleasing objects of contemplation? Twenty years ago, the more secluded part of Arden was a kind of terra incognita to all but those born in it. When the late Mr Inglis about that time passed a winter at St Hubert, its principal town, the people there had never seen an Englishman. 'The third day,' he says, 'after my arrival, when the girl was laying the cloth for dinner, she suddenly stopped her work, and addressing me, said, "Mais Monsieur êtes vous vraiment un Anglais?" and upon my assuring her that I was, she continued to look at me for some moments as I should look upon an inhabitant of Terra del Fuego.' At that time there was no road nearer than the Meuse passable for a public vehicle. What was then meant by a road, was a track for a cart, distinguishable from the country only from the circumstance of there being less grass or heath upon it. All this is altered now. Capital macadamised roads are cut right across the district; decent inns, still few and far between, have sprung up along them; public conveyances, to the number of twenty, traverse it daily, and the passengers they convey are no longer exclusively natives. Hither flock crowds of tourists and wandering artists—French, Belgians, and Germans; and amongst them, every now and then, appears a solitary Briton, on his way to the Moselle and the more beaten regions of the Rhine.

It was a glorious September morning when I left a motley group of this description, and turning my back upon the Meuse and the picturesque old town of Dinant, began immediately to ascend by a capital new road which leads across the country to Metz in France. The day was favourable for walking; clouds drifting at intervals over the sun, threw the steep hill-sides into that alternate light and shadow so dear to the artist, and enabled me to gaze at ease, free from that unsleeping enemy the sun. The road ascends uninterruptedly for two miles, showing the great depth of the Meuse valley below the level of the country, and then the dry fresh air blows freely round, and we step forth at once upon the lofty upper region. About six miles in advance is a noble piece of scenery, hill, wood, and glen, each on the largest scale, intermingling around the road, which is borne across the opening upon an astonishing embankment. A cottage, with its never-ceasing mill, snugly nestled in the bottom, lent the requisite touch of humankind; and the whole seemed just the

some where one might fancy the banished duke, with his sylvan court, to have taken their noontide rest. This, however, was a brief interlude. The country hereabouts, and for miles in advance, is called the Fa-mille; a good corn country, but with little to interest, and presents the same unvaried succession of round-backed hills, each like the other, with occasional glens, which are beautiful when found, but cannot be seen from the road. At a little distance on the right, King Leopold has his country-seat of Ardenne; small, but finely placed in a most solitary situation. The king is often here, for the advantage of hunting; and his frequent residence has done as much as anything to bring the country forward. Besides the palace, a roadside inn, bearing the royal arms, was the only habitation in sight, where a party of Ardenais (so the men of the Ardennes are called) were just commencing their dinner; and as our appetites by this time were pretty sharp-set, we gladly accepted their invitation to join them.

The company consisted, besides the host, of four strapping Ardennes farmers, in their blue blouses, and four of the royal guard, in all the finery of spurs, tassels, and worsted epaulettes. There was nothing very particular about them; but the dinner was a curiosity, and worth detailing, as a specimen of how the substantial country-folks contrive to live in this part. After the usual thin soup, and the meat from which the said soup had been extracted, which are the first dishes presented all over the continent, there was placed on the table by a heavy-built damsel, with flaming red petticoat and massive gold ear-rings, a huge dish of smoking mutton outlets, with apple-sauce, flanked by dishes of carrots and potatoes; then came a platter of shelled beans stewed, a common dish here; then an immense bowl of apples, cut into halves, and stewed, followed by roast fowls, with excellent mushrooms; and then some preparation of meat, which I could not identify by taste or sight, and exceedingly tough. By this time our appetites were pretty well blunted; but the carver, unappeased, began whetting his blade, and all was expectation, till a noble Ardennes ham made its appearance, forest-fed, and with a strong smack of what we may fancy to be the wild-boar flavour, supported by cray-fish, smoking hot, and no less than four immense fruit-pies, served up in wicker platters, and a foot at least in diameter. For the whole repast, the sum asked was one franc (ninepence three-farthings), and for which we might have had fruit and coffee in addition if we had pleased. The raw materials at home could hardly have been given for three times the sum.

After such a meal, I shall make but one step from this to Rochefort, ten miles farther on. The country continues the same, and the only thing remarkable is the magnificent construction of the road, which is borne across deep valleys, and cut through hills, in a manner more resembling the great works upon a principal railway line, than an untravelled road in a remote district. Rochefort gets its name from a castle on a height, the ruins of which are still considerable, and worth a visit; but its chief attraction is its containing the only decent inn within walking distance of the great caverns of Haas, where the turbulent river Lesse forces its way through a barrier of hills, and flows through a long succession of stalactite caverns for a mile and a half before it emerges into day.

Another ten miles farther on is the ancient town of St Hubert, and half-way between Rochefort and St Hubert a solitary oak, at the bottom of a steep ascent, marks the beginning of Ardennes proper—the Arden of the poet. The sun was now fast sinking, when the outskirts of the great forest of St Hubert appeared close at hand; and deep black masses of timber-trees sweeping round the horizon, and at this instant overhung by heavy thunder-clouds, looked imposing and gloomy enough. The trees have been cleared away for about a mile on each side of the town, and in the open space stands St Hubert, a miserable collection of small houses, sur-

rounding one of the finest churches in Belgium. Here, as the legend goes—which the peasantry all devoutly believe—Hubert, the mighty hunter, while pursuing his favourite diversion on Good-Friday eve, beheld a stag bearing a cross between its horns. The apparition, which he believed to be miraculous, and to be sent from Heaven, recalled him from his evil course of life. He became a holy man, so as to work miracles not merely by his hands, but by his garments; so that even a shred of his mantle possessed virtue enough to cure hydrophobia, if placed on the patient's head; and all hunters henceforth regarded him as their patron saint. The abbey church, supposed to be built on the very site of his cell, is still a great place of pilgrimage, and the government has of late years annually given a considerable sum towards its restoration, besides which, it has received magnificent presents from the queen. Externally, it is a square substantial building, only with a high-peaked roof, but the interior is dazzling. The Ardennes is a marble country, and everything is marble in the church, from the pavement and pillars to the smallest ornament—red, white, and black marbles in more than royal profusion.

Our evening's walk to Champlon was not quite so joyous as that of the morning had been; for by this time we could say with Touchstone, 'I care not for my spirits, if my legs were not weary.' About two miles from St Hubert we re-entered the forest, and walked on, without meeting a soul during two hours, to Champlon, between rows of forest-trees, so closely set, that the momentary glimpses between the trunks showed like darkness visible, while from out of their depths the long whine of a welf followed us with disagreeable distinctness. Not being used to such attendants, the first sensation was anything but pleasant, and I for one could have once more echoed Touchstone's opinion, 'Here I am in Arden, the more fool I; when I was at home, I was in a better place.' Late in the night we reached Champlon, and having succeeded at last in obtaining comfortable rooms, were soon happy in the full enjoyment of a good night's rest. When the bright sun came to light up all, we found, to our surprise, that the dismal gloom of the foregoing night, with its thick impenetrable shade of tall straight trunks, had changed into the prettiest sylvan scene imaginable. Huge oaks and beeches, side by side, flung their massive arms and coronals of leaves over an emerald green turf, with long vistas of light, and sudden breaks opening up between them into the inmost recesses of the woods; the ash, the hazel, and the birch mingled with these their lighter tints, as in a natural plantation; and alders and willows fringed the many rapid brooks which gurgled on the bottoms, or stagnated in solitary tarns, covered with the dazzling petals of the *nymphaea palustris*, and other great water-lilies. Still, the farther we strayed, the greater was the variety; for the forest contains all in itself—wild heaths, scattered rivers and pools, hamlets, villages, and towns, which might elsewhere seem considerable, but are here fairly subdued, and appear as nothing among the wilderness of woods. 'It is not,' as Inglis says, 'like the woods which one is accustomed to in England, stretching over plains or the sides of the hills. It encloses within it every diversity of hill and dale—deep ravines, wide valleys, rocky steepes, high hills, rivers, streams, and lakes, presenting a combination of the most striking and diversified scenery. We trod upon a carpet of the greenest velvet; the long arms of the rugged pine or the branching oak occasionally met overhead, while here and there the trees receded, and formed little amphitheatres of surpassing beauty; sometimes the path descended into deep dells, sometimes it climbed abrupt precipices; brooks frequently obstructed its progress, often with no bridge over them, and at times with one formed of the trunks of trees. Sometimes at the opening of a forest vista a deer would bound across; sometimes at sudden turnings little animals of the ferret tribe would be seen for an instant, and then be heard rustling through the thick brush-

wood.' Just as Inglis describes we wandered on through the day, and when twilight came, blending everything in its uniform dusky hue, we returned to our inn, fully convinced that this was Shakspeare's Arden, and no other.

The correspondence, indeed, between the poetic description and the reality is curiously exact, considering the scenes described were unknown to the poet. The savage touches indeed are wanting; the 'green and gilded snake,' and the 'lioness with udders all drawn dry,' from which Orlando delivered his tyrant brother, existed only in the imagination; and though wolves there are, they are as unlike as possible to their hungry brethren of the Russian steppes—peaceable animals, well fed by royal orders, to be slain in state by great personages on great occasions. But the spirit and character are given to the life, and it is difficult to believe, when thus on the spot, that Shakspeare wrote without actual knowledge of the ground. We know that he never was out of England, so that his details are purely imaginary; yet few travellers would doubt that he had often been here. Everywhere the wanderer is tempted to identify the names in the poem with the spots before his eyes. He even begins to conjecture about time and place, and to ask himself where the forester lords most lived, and how long they had led their pleasant life under the greenwood tree. He concludes that it was assuredly summer when Jacques laid himself down at his length under an oak to pore upon the brawling brook; and one winter they would seem to have braved among the oaks, and had learned by experience what it is to endure the icy pangs and chiding of the winter's wind when in Arden, where the snow lies from November till March. The reason seems to be that which Coleridge assigns; namely, that Shakspeare does not give a description of rustic scenery merely for its own sake, or to show how well he can paint an actual object: he only touches upon the larger features and broader characters, leaving the filling-up to the imagination. Thus a few very brief touches give the glimmer and gloom of old trees; so that all the details of the well-known landscape by Sir George Beaumont, now in the National Gallery, are suggested in fourteen words: but what words these are, and how each of these fourteen words helps out the picture! The like has been remarked of Sir Walter Scott's descriptions of scenes which he had never personally visited, and is probably true of every great imaginative observer of nature.

The constant perception of natural phenomena which they lack the knowledge to explain, the sights and sounds of nature in her wilder moods, but especially in forests, the roaring and whistling of the wind through the trees, the cries of nocturnal beasts and birds, and the fitting and reappearing of marsh-lights and exhalations—are all eminently calculated to make an uneducated peasantry superstitious; and the foresters of Arden are no exceptions to the rule. Here flourish undisturbed many of those beliefs and observances which extended reading is effectually putting to rout on our northern borders, together with some peculiar to the district. The belief in the existence and agency of good and evil spirits is more or less prevalent, and mountain spirits, dwarfs, and domestic goblins abound. The principal spirits are a kind of 'lubber fiend,' called *Sotays*, corresponding exactly with the Scottish brownies. They work hard, like the brownies, for those they take a fancy to: thrash the corn, and winnow it, mow the hay, clean the house, and rub down the horses; their customary reward for which is a bowl of milk. The ruined castles which abound hereabouts are believed to be under the peculiar tutelage of a class of evil spirits called '*gattes d'or*,' from the Walloon *gatt*, a goat. The worship of the goddess Diana, the ancient tutelary genius of the Ardennes, long held its ground against the priests; and on certain festivals, not many years ago, was displayed a mysterious banner, with the likeness of a centaur, half-woman, half-horse, ending in a lion's tail, holding a bow in its right hand, and an arrow in its left, for which the peasantry,

who held it in the highest reverence, could give no explanation, but which the learned have agreed to be a relic of the worship of Diana.

It may be concluded, from the above, that the Ardennes are not peculiarly enlightened, which is true; but it is only fair to them to add, that, with the intelligence, they likewise lack some of the besetting vices of people living in large masses. A more simple people does not exist. It would be easy to speak of their valour and military qualities, when, like the Swiss, they served in the armies of Spain and France; but a more honourable distinction is their unflinching industry, together with the patience they display under calamity. The traveller cannot fail to be struck, in Belgium, with the multitude of beggars which beset him everywhere—by the road-side, at the railway stations and hotels, and in and about the churches: their number is legion. Even in the happy valley of the Meuse, where agriculture and manufactures go hand in hand, the pedestrian may reckon, with tolerable certainty, upon being importuned for charity once in every two miles. In the Ardennes alone, which is by far the poorest part of Belgium, there are no mendicants. There are no rich: here and there a great square building, pierced with many windows, looking like a manufactory, and called a chateau, denotes a resident proprietor; but these are rare; and he is rich even for a baron in Ardennes who has a thousand pounds a-year. But then there are none absolutely destitute; all stand alike upon the same level of a real but uncomplaining poverty. During the last winter, when the potato crop failed all over Belgium, the Ardennes, which had suffered most severely, were the only part which did not petition the government for relief. Their cottages, built of stone, turf, and thatch, are small, but reasonably clean. Each cottage contains its Dutch clock assiduously ticking in a corner, its pewter and earthenware utensils, its wooden table and chairs, and ample wood fire, smouldering on a hearth of bricks. Rye-bread and potatoes form the staple of their food, with coffee when they can get it, and a little tobacco. The means of getting even this are wrung with difficulty from an inferior soil, which the want of capital and markets prevents from being cultivated to the best advantage.

As you walk along, small fields and little narrow strips of land of themselves denote the existence of a number of small proprietors. The agricultural system adopted is something like that of out-field and in-field once universal in Scotland; but the great resource of the peasantry, as in all upland countries, is pasturage, and the irrigation of their meadows is pursued by them with great assiduity and skill. At the time of the snow-melting, when the hill-sides are running with water, the overplus is distributed equally over the surface by a multiplicity of ditches and conduits, the level being regulated with great care. The reward of this labour is an abundance of coarse herbage, nourishing large herds of cattle, the sale of which in the border provinces of France is a chief source of subsistence. Many of the streams which feed this verdure are dried up during the fierce heats of summer; and a prairie or water-meadow, warranted to last through the year, fetches a very high price, considering the value of money. It is not probable that the state of things here described will continue much longer. Already a railway, planned by British engineers, and executed by British capital, is commenced through the district, to construct which thousands of acres will be dismantled of their timber. The consequent demand for labourers has already raised the labour-price one-half. The railway will bring lime, and lime will make fruitful corn-fields out of desolate heaths. The fine oaks and beeches, now rotting on the ground, or felled only for firewood, owing to a want of the means of transport, will then realise their value, and a general clearance will ensue. The squirrels will be dismounted; the few remaining wolves knocked on the head; the deer will vanish with the destruction of their covers, or survive only in

parks; the sights, sounds, thoughts, and feelings of pleasant but unprogressive woodland life, will give way to the features and habits of a thriving and well-peopled country; and a few venerable trunks, preserved by accident or taste, will alone mark the site of the perished Forest of Arden.

BREAD UPON THE WATERS.

We are all aware of the importance of water in the aliment of plants; but in some parts of the world vegetable food is grown in lakes and rivers, just as here it is cultivated in fields. The closest approach we make to this is in our plantations of water-cresses; but in the south of France and in Italy, as we proceed towards a higher latitude, the water-nut—a most important production, as we shall see—first appears in the market. The seeds of this plant, which grows in the water, consist of pure edible fecula, and are eaten raw, roasted, or in soups, and, from their taste, usually receive the name of water-chestnuts. In Venice they were formerly sold, we do not know why, as 'Jesuits' Nuts;' and Pliny's account of their being gathered by the dwellers on the Nile, is confirmed by some being still occasionally found in the folds of the mummy cloth.

In India the water-nut, which is there called Singara, is extensively grown, both for local consumption and transport, and is frequently carried on the backs of bullocks several hundred miles to market. The tanks where it is cultivated are laid out in *fields*, the limits of which are marked by tall bamboos, and the peasants pay for the holdings by the acre. These water-farmers conduct their operations by means of boats; planting, weeding, and gathering in their singara at the proper seasons, just as their brethren on land do with their wheat or barley. And a tank in India, be it remembered, is rarely a pond; it is often a considerable lake, and sometimes might present to an unaccustomed eye the appearance of an inland sea, with only the high land dimly visible beyond. In such cases the tanks are not excavations, but extensive valleys, dammed up at the lower end, so as to confine the waters of the district in one immense basin; and the steps which lead to them, instead of being formed of hewn stone, as in smaller works of the kind, are the declivities of granite mountains. In southern India these vast reservoirs are, in some instances, more than twenty miles in circumference; and we are told of embanked dams between the Indus and the Suliman mountains thirty miles long.

The singara lakes have sometimes proved a great blessing to the towns in their neighbourhood—for the water plants do not fail, like those of the land. Colonel Sleeman mentions a lake in Bundelcund which, by means of roots and fish, preserved the lives of seven towns during a recent famine. This sheet of water was four miles long by two broad; but from the mountain-ridge forming one of its sides the traveller saw a still more extensive lake, which had answered a similar purpose on a larger scale. The ridge, dominated by the ruined palace of the Hindoo prince who constructed the tank, was composed 'of high and bare quartz hills, towering above all others, curling and foaming at the top like a wave ready to burst when suddenly arrested by the hand of Omnipotence.'

The leaves of the plants float upon the surface of the water, and in the earlier part of the day present the appearance of a green field; but in the afternoon their pure white flowers expand, and peeping, opening, or bursting into beauty, give an agreeable variety to the picture. When the flowers decay, the nut, which is under the water, begins to ripen, and in September the harvest is ready. The white kernel is covered with a tough brown integument, and the whole is imbedded in a triangular shell. It is not fit for consumption for more than three months, when eaten *au naturel*; but it is likewise used in the form of meal, and will then keep for a considerable time.

In China the water-nut is extensively cultivated in lakes and ponds, but more especially in the shallower waters of the Imperial Canal. The sacred lotus, however, appears to be there more widely diffused; and not, with

so practical and prosaic a people, on account of its superior beauty, but more probably because the roots, as well as the seeds, are eatable. The seeds are described by Davis as resembling an acorn without the cup, and the roots as being white, juicy, and of a sweet and refreshing taste. Its 'tulip-like but gigantic blossoms, tinted with pink or yellow, hang over its broad peltated leaves;' and this gorgeous carpet is spread over immense fields of water.

Cashmere, however, must be considered as the country *par excellence* of the water-nut, since there a very considerable portion of the population live upon it alone. This region is embosomed in mountains, the culminating ridge which shuts it in from the rest of the world forming an oval figure one hundred and twenty miles long and seventy miles broad. The plain at the bottom, however, is estimated by Hugel at only seventy-five miles long and forty miles broad; the intermediate space being composed of the precipitous sides of the mountains, swelling out as they descend into green hills, that sink gracefully into the emerald sward of the plain. The summits are crowned with perpetual snow, and cataracts rush down their ravines; but, on approaching the vale, these torrents lose their fierceness, and roll in smooth streams, between undulating hills, till they reach the central waters. These are surrounded with perennial spring, and wander through groves and plains which the traveller Bernier concluded to have been actually the site of the Garden of Eden!

The waters are composed of the river Jailum, which wanders through the whole valley, now expanding into shallow lakes, one of which is twenty miles long and nine broad, and now rolling in a deep full stream, flanked by numerous small lakes and tarns. The excessive richness of the vegetation in this remarkable valley is not confined to the dry land; for every piece of water is mantled over either with nuts or lotus. In the Walur lake, sixty thousand tons of nuts are raised every year, and they are the sole subsistence of twenty thousand persons, who think it an almost intolerable calamity when driven to have recourse to any other kind of food. The superficial extent of this lake is a hundred square miles, by which some idea of its extraordinary productiveness may be formed, supporting as it does two hundred persons to the square mile.

The other waters are clothed with the more picturesque lotus, the seeds or beans of which are here eaten as a delicacy when they are unripe; and the leaf-stalks, when boiled till they are tender, are considered palatable and nutritious food. The flower and leaf of the lotus always floats; and for this reason, probably, the plant is regarded by the Hindoos as a mystic emblem of the preservation of the world during the deluge. In Cashmere, however, it has the more practical merit of supporting a considerable part of the population, although no author has attempted to estimate the amount of its produce. We may add, that the population fed upon such substances—including those who live upon the nuts alone—are described by all travellers as being models of strength, symmetry, and beauty.

The lotus appears to be likewise indigenous in America; and there the seeds, as in Cashmere, are eaten when green. We copy the following very remarkable picture from 'Flint's Geography and History of the Western States:—

'Among the flourishing aquatic plants, there is one that, for magnificence and beauty, stands unrivalled and alone. We have seen it on the middle and southern waters; but of the greatest size and splendour on the bayous and lakes of the Arkansas. It has different popular names. The upper Indians call it Panocco. We have seen it designated by botanists by the name *Nymphaea nelumbo*. It rises from a root resembling the large stump of a cabbage, and from depths in the water of two or three to ten feet. It has an elliptical, smooth, and verdant leaf, some of the largest being the size of a parasol. These muddy bayous and stagnant waters are often so covered with these leaves, that the sandpiper walks abroad on the surface without dipping her feet in the water. The flowers are enlarged copies of the *Nymphaea*

oderata, or New England pond-lily. They have a cup of the same elegant conformation, and all the brilliant white and yellow of that flower. They want the ambrosial fragrance of the pond-lily, and resemble in this respect, as they do in their size, the flowers of the laurel magnolia. On the whole, they are the largest and most beautiful flowers that we have seen. They have their home in dead lakes, in the centre of cypress swamps. Mosquitoes swarm above, obscene fowls wheel their flight over them, alligators swim above their roots, and moccasin snakes bask on their leaves. In such lonely and repulsive situations, under such circumstances, and for such spectators, is arrayed the most gaudy and brilliant display of flowers in the creation. In the capsule are imbedded from four to six acorn-shaped seeds, which the Indians roast and eat when green; or they are dried, and eaten as nuts; or are pulverised into meal, and form a kind of bread.*

The *Victoria Regina*, found by Mr Schomburgh in the river Berbice, slightly differs from the nymphæa botanically. He describes it as 'a vegetable wonder—a gigantic leaf from five to six feet in diameter, salver-shaped, with a broad rim of a light-green above, and a vivid crimson below, resting on the water. Quite in character with the wonderful leaf was the luxuriant flower, consisting of many hundred petals, passing in alternate tints from pure white to rose and pink. The smooth water was covered with the blossoms; and as I rowed from one to the other, I always found something to admire.'

Among the plants cultivated in water for the food of man may be included rice; although this grows not in lakes or rivers, but in small dams, as the fields may be termed. Rice is likewise different from the other productions we have mentioned, inasmuch as the plants live, though they do not thrive, in dry ground. In this case, however, the produce is rarely a tenth part of a full crop; to obtain which, not only irrigation, but entire submersion is necessary. In India the rice-fields are frequently under water, even when they are ploughed; and thus the operation, as Tennant observes, more nearly resembles that of a potter in preparing and setting his clay, than the cultivation of a field. The plants, however, are first brought to a certain height in a separate bed, and then transplanted into the water; which is done by fixing a ball of clay to the roots of two or three stalks, and dropping the whole into the pond. This explains a passage in Ecclesiastes, more frequently quoted than understood—'Cast thy bread upon the waters, and thou shalt find it after many days;' which means that, in the ordinary providence of God, we shall enjoy the reward of a good work in due season. We have but to plant; and the sun, the winds, and the waters—the ministers of a higher Power—whose operations we cannot comprehend, will bring the seed to perfection.

In China, Captain Hamilton observed the cultivators sailing among their crops in boats; and Medhurst tells us that, from the preparing of the ground for the seed, almost to the reaping of the harvest, the rice-fields must be overspread with water. For this purpose each field or shallow pond has an elevated ridge or border, with a stream continually flowing in; a precaution requisite to provide against waste by evaporation, as well as to insure a supply from the overplus to the lower grounds. The water is either 'raised by artificial means—such as pumps, levers, wheels, &c.—from a lower to a higher region, or conducted, with great skill and care, from some elevated position along the sides of hills, and across valleys, to the desired spot; where, introduced into the highest field of the series, it gradually flows down to the lower terraces, until it is lost in the river or the sea.' Crawford notices the same practice in some parts of the Indian Archipelago, and adds that, when ripe, this most beautiful of all cereal crops, then of a rich golden colour, waving in tall masses, terrace above terrace, gives an inexpressible magnificence to the landscape.

The necessity for a copious supply of water in the cultivation of rice is one principal cause of the famines which from time to time have desolated India. There

the abundance or scantiness of the rains during the wet season is a question of life and death to tens of thousands. The wells and tanks are at such times of little use for irrigation, as the bullocks die for lack of provender; and the grain perishes, partly from the drought, and partly from want of cultivation. In this position each inland district is shut up in its own misery; for, generally speaking, there are no roads by which to bring relief, and no money, if there were roads, to purchase it. The people die in thousands without a murmur, for they recognise in the cause of the famine the finger of Providence; ignorant, from ages of misrule, of the awful responsibility which weighs upon their rulers. The roads swarm with fugitives from the land of famine, travelling sick, faint, and weary, in search of food. In the villages, as they pass, the mothers offer their babes to strangers, but the strangers are as destitute as themselves. Some lie down by the wayside, and the highway is strewn with their corpses; while others crawl into gardens and ruins, to die in silence and alone. The less hopeful never leave their famine-stricken hamlet at all; but, ashamed to go forth for the purpose of begging, take opium—husband, wife, and children—and expire in each others' arms.

In such awful cases, the lakes and tanks at least diminish the misery they cannot remove. The water-nut supports its thousands; and the sacred lotus realises the dream of the Brahmin—being not only an emblem, but a means, of the preservation of human life till the angel of destruction has passed by.

FACTS FROM GWEEDORE.

In the county of Donegal, on the north-west coast of Ireland, is situated a wild mountain district called Gweedore, about which a pamphlet of a remarkable nature, from the pen of Lord George Hill, has lately made its appearance.* The object of the publication is to satisfy a reasonable curiosity which has been expressed by his lordship's friends respecting a somewhat Quixotic attempt to improve an estate, or, more correctly speaking, to reclaim from worse than a state of nature a tract of country of which he had become the purchaser. The noble author's production boasts none of the graces of polite literature; it is little else than a series of facts treated plainly and statistically; but on that account we like it all the better. Practical and to the point, it demonstrates, in language not to be misunderstood, what a new world Ireland might become were its landowners resolutely to address themselves to the task of improvement. The account of Lord George Hill's efforts, however, may be inspiring in other quarters; and as his 'Facts from Gweedore' have as yet attracted little attention from the press, we propose to give them as wide a publicity as may be possible through the medium of these pages. It will be necessary, in the first place, to describe the condition of Gweedore previous to its change of owners.

Gweedore, which forms part of the parish of Tullaghobegly, extends to twenty-three thousand acres of mountain-grazing and arable land. Up to 1838, it belonged to a number of proprietors, none of whom resided in the district. The population of the parish amounted to about nine thousand individuals, of whom a third were located in Gweedore. The Irish language was universally spoken, and comparatively few knew English. There does not appear to have been any clergyman of the established church within the district. The people were all Roman Catholics, and had a chapel and a priest. Besides this gentleman there was a schoolmaster, on miserable pay, who taught a few pupils; likewise a coast-guard and constabulary force. And here may be said to conclude the list of individuals above the condition of an ignorant, wretched, and lawless peasantry. Grazing of cattle and sheep, the cultiva-

* Facts from Gweedore; compiled from Notes, by Lord George Hill. Dublin: Philip Dixon Hardy and Sons. London: Hatchard and Sons, Piccadilly. 1846. An 8vo. pamphlet, with cuts and map.

tion of patches of land, fishing at certain seasons, and the illicit distillation of whisky, formed the means of general subsistence. Everything was on the rudest possible scale. There were no handicrafts, no inns, no shops; articles were purchased at a dear rate from hawkers, and the produce of the district could be disposed of only at fairs or in distant towns. The state of the roads was also deplorable. 'Even in the year 1837, when the lord-lieutenant made his tour through those parts of Donegal, the leading road was so broken up and intercepted by boggy sloughs (though in the middle of summer), that his excellency might not have been able to proceed along part of it, had it not been for the ingenuity of a country fellow, who, observing the difficulty, with all the quickness and spirit of a rustic Raleigh ran to his cabin, whipt off the door, and hurrying to his excellency's relief, laid it down before his horse's feet; by this device his lordship and staff were enabled to proceed in comfort. As soon as they had passed, the man immediately hoisted the door on his shoulders, tripped on merrily before his excellency, until he saw it necessary to lower it again; and thus he accompanied the cavalcade, being, perhaps, not the least useful attaché to the suite.'

In the same year in which the lord-lieutenant paid a visit to Donegal, a memorial was presented to his excellency by Patrick M'Kye, teacher in the parish, showing the general state of affairs. We transcribe it as a curiosity.

'Humbly sheweth—That the parishioners of this parish of West Tullaghobegly, in the barony of Kilmacrennan, and county of Donegal, are in the most needy, hungry, and naked condition of any people that ever came within the precincts of my knowledge, although I have travelled a part of nine counties in Ireland, also a part of England and Scotland, together with a part of British America; I have likewise perambulated 2253 miles through seven of the United States, and never witnessed the tenth part of such hunger, hardships, and nakedness.

'Now, my lord, if the causes which I now lay before your excellency were not of very extraordinary importance, I would never presume that it should be laid before you. But I consider myself in duty bound by charity to relieve distressed and hungry fellow-man; although I am sorry to state that my charity cannot extend farther than to explain to the rich where hunger and hardships exists, in almost in the greatest degree that nature can endure. And which I shall endeavour to explain in detail, with all the truth and accuracy in my power, and that without the least exaggeration, as follows:—All within the parish [9049 in 1841] are as poor as I shall describe them. They have among them no more than one cart, no wheel car, no coach or any other wheeled vehicle, one plough, sixteen harrows, eight saddles, two pillions, eleven bridles, twenty shovels, thirty-two rakes, seven table-forks, ninety-three chairs, two hundred and forty-three stools, ten iron grapes, no swine, hogs, or pigs, twenty-seven geese, three turkeys, two feather beds, eight chaff beds, two stables, six cow-houses, one national school, no other school, one priest, no other resident gentleman, no bonnet, no clock, three watches, eight brass candlesticks, no looking-glasses above threepence in price, no boots, no spurs, no fruit-trees, no turnips, no parsnips, no carrots, no clover or any other garden vegetables, but potatoes and cabbage, and not more than ten square feet of glass in windows in the whole, with the exception of the chapel, the school-house, the priest's house, Mr Dombrain's house, and the constabulary barrack.

'None of their either married or unmarried women can afford more than one shift, and a few cannot afford any; more than one-half of both men and women cannot afford shoes to their feet, nor can many of them afford a second bed, but whole families of sons and daughters of mature age indiscriminately lying together with their parents.

'They have no means of harrowing their land but with meadow rakes. Their farms are so small, that

from four to ten farms can be harrowed in a day with one rake.

'Their beds are straw—green and dried rushes or mountain bent: their bedclothes are either coarse sheets, or no sheets, and ragged filthy blankets.

'And, worse than all that I have mentioned, there is a general prospect of starvation at the present prevailing among them, and that originating from various causes; but the principal cause is a rot or failure of seed in the last year's crop, together with a scarcity of winter forage, in consequence of a long continuation of storm since October last in this part of the country.

'So that they, the people, were under the necessity of cutting down their potatoes and give them to their cattle to keep them alive. All these circumstances connected together, has brought hunger to reign among them to that degree that the generality of the peasantry are on the small allowance of one meal a-day, and many families cannot afford more than one meal in two days, and sometimes one meal in three days.

'Their children crying and fainting with hunger, and their parents weeping, being full of grief, hunger, debility, and dejection, with glooming aspect, looking at their children likely to expire in the jaws of starvation. Also, in addition to all, their cattle and sheep are dying with hunger, and their owners forced by hunger to eat the flesh of such.

'Tis reasonable to suppose that the use of such flesh will raise some infectious disease among the people, and may very reasonably be supposed that the people will die more numerous than the cattle and sheep, if some immediate relief are not sent to alleviate their hunger.

'Now, my lord, it may perhaps seem inconsistent with truth that all that I have said could possibly be true; but if any unprejudiced gentleman should be sent here to investigate my report, I will, if called on, go with him from house to house, where his eyes will fully satisfy and convince him, and where I can show him about one hundred and forty children bare-naked, and was so during winter, and some hundreds only covered with filthy rags, most disgusting to look at. Also man and beast housed together; that is, the families in one end of the house, and the cattle in the other. Some houses having within their walls from one to thirty hundredweights of dung, others having from ten to fifteen tons weight of dung, and only cleaned out once a-year!

'I have also to add, that the national school has greatly decreased in number of scholars, through hunger and extreme poverty; and the teacher of said school, with a family of nine persons, depending on a salary of £8 a-year, without any benefit from any other source. If I may hyperbolically speak, it is an honour for the Board of Education!

It would be scarcely possible to imagine a state of things more deplorable than is here represented; and it will appear surprising how such abject destitution should have occurred at all. This involves an interesting point in political economy; affording a striking picture of the abyss into which a people may sink by following a wrong social and industrial system. It may be said that affairs could not have sunk into so lamentable a condition had the landowners resided on their properties; but at the same time it would be too much to impute blame exclusively to absenteeism. The landlords drew comparatively little money from their properties. The rents were small, and ill paid. Arrears frequently accumulated for years; bailiffs were afraid to execute writs within the district; and often no rents were paid at all. Practically, the land was held in permanence by the tenants. There was no getting them out of it. They appropriated and used, divided and subdivided, mortgaged and bequeathed their farms just as if they had been their own property. In the course of time, accordingly, the whole district was cut up into patches, and had got into a numerous variety of hands, altogether different from those

acknowledged by the lawful owner. As an instance of this species of subdivision and transfer, one field of about half an acre was held by twenty-six persons. 'The farms were also frequently, at the death of parents, reduced to atoms at once; being then divided among all the children: in such cases, when the farm was small, it left to each a mere shred, and by this simple process the next generation were beggars.' The whole district, therefore, was as nearly as possible an arbitrary appropriation by its inhabitants; and yet these people, in doing what they liked, were plunged into a state of poverty the most appalling the imagination can conceive. Those who entertain the theory that capitalists are monsters of rapacity, and that the world might be transformed into an earthly paradise by giving every man his acre, will do well to ponder on this instructive fact.

The truth is, neither the landlords nor tenants were specially to blame. The error lay in a system which had been growing up for ages, and of which both parties were ultimately the victims. The practice of dividing and re-dividing the lands, to accommodate a poor and increasing population, was the proximate source of deterioration. We are told that in many instances farmers had patches of land in thirty to forty different places, without fences to separate them from other patches, or to keep out cattle; and it was a rule that such patches should be of different qualities—good, middling, and bad—in order that all might share alike. Disputes, fights, trespasses, and confusion were the natural consequences of this *Rundale* system, as it was called; and sometimes a poor man would abandon his inheritance of thirty shreds of ground, in utter despair of ever being able to make them out. Worse than all, 'on a certain day all the cattle of the townland were brought from the mountains, and allowed to run indiscriminately over the arable land, and any that had not the potatoes dug, or other crops off the ground, were much injured; neither could any one man venture to grow turnips, clover, or other green crops, for nothing short of a seven-foot wall would keep out the mountain sheep.' In addition, there prevailed a practice of holding pieces of land in partnership, and the very animals were sometimes matter of division. 'In an adjacent island, three men were concerned in one horse; but the poor brute was rendered useless, as the unfortunate foot of the supernumerary leg remained *unshod*, none of them being willing to acknowledge its dependency, and accordingly it became quite lame. There were many intestine rows on the subject; at length one of the "company" came to the mainland, and called on a magistrate for advice, stating that the animal was entirely useless now; that he had not only kept up, decently, his proper hoof at his own expense, but had shod this fourth foot twice to boot! yet the other two proprietors resolutely refused to shoe more than *their won foot*!'

Here we may close the evidence as to the condition of Gweedore previous to 1838, in which year, and subsequently, the properties now composing the estate were purchased by Lord George Hill. We shall now see how his lordship set to work to remedy this state of affairs.

The acquisition and transference of land in Ireland is usually a matter of serious difficulty; any attempt to reorganise the tenancies being frequently visited by the assassination of the principal or his agents. Perhaps too little pains is taken on such occasions to explain matters to the people, or to commence in the right way. It does not appear that Lord George Hill was exposed to anything like indignity or outrage on taking possession of his property or remodelling the tenancies. Fearless of danger, he went with his agent to reside on the spot, central to the operations which he intended to pursue. His object was to become personally acquainted with his tenantry, and so obtain an insight into their condition and character. For this purpose, on establishing himself at Gweedore, he visited every house in the

district, and entered into conversation with its inmates in their own tongue, which he fortunately was able to speak. The intercourse so established was pleasing and attractive to the people, who had never before heard the language of sympathy from a superior; and they asserted that their new landlord 'could not be a lord at all, particularly as he spoke Irish.'

The first thing done was to induce the abandonment of illicit distillation, which caused ruinous habits, poverty, and social disorder, and likewise occasional famines, by consuming the grain which should otherwise have been made into food. It was of no use, however, attempting to preach down this evil. The plan consisted in opening up a market for the disposal of grain at a fair price, payable in ready money. 'In 1839, a corn store, eighty-four feet long by twenty-two feet wide, having three lofts and a kiln, was built at the port of Bunbeg, capable of containing three or four hundred tons of oats. A quay was formed in front of the store, at which vessels of two hundred tons can load or discharge, there being fourteen feet of water at the height of the tide. A market was thus established for the grain of the district, the price given for it being much the same as at Letterkenny, six-and-twenty miles distant. There was much difficulty in getting this store built; even the site of it had to be excavated, by blasting from the solid rock, and there were no masons or carpenters in the country capable of erecting a building of the kind. So great was the difficulty of getting even a coffin made, that to secure the services of a carpenter, such as the district afforded, many of the people gave him annually, by way of a retaining fee, sheaves of oats, on the express condition of making their coffin when they died! It was therefore found necessary to introduce competent tradesmen; and even then much manoeuvring was requisite to get those who were brought for the purpose to remain. They were paid regularly every Saturday night; but it was by no means unusual, on mustering the hands on Monday morning, to have it reported that a carpenter or mason had deserted in the interval; and it was no wonder! The aspect of the country being so prodigiously different from anything they had ever seen, and the comforts they had been accustomed to, such as bread and meat, not for any consideration to be procured, there being neither baker nor butcher nearer than a day's journey!'

The store acted like a charm. In the first year of its operations the sum of £479, 9s. 6½d. was paid for oats; and for the year 1844 the amount was £1100. Grain, butter, hides, and wool were also purchased; the whole being shipped for Liverpool; and between that port and Bunbeg a trade accordingly sprung up. Much as the money payments for oats were prized, they were of comparatively little use, in consequence of there being no means of laying them out to advantage. Lord George Hill, as a capitalist, again interposed to do that which no one else had the means to undertake. He established a wheelwright, to make carts and wheelbarrows; and opened a shop, at which iron, wood, salt, soap, candles, sugar, tea, and a few other articles were sold at the Letterkenny prices. The wheelwright, under the superintendence of the agent, acted as shopkeeper; but its noble owner put up a signboard with his own name over the door, expressing in Irish that he was licensed to sell tea, tobacco, and other excisable articles. Every year the business of the shop increased. The first quarter's sales to December 1840 amounted to £40, 12s. 10d., whilst the corresponding quarter for 1844 was £550. So many new articles are now added to the stock, that the shop embraces pretty nearly everything in groceries, crockery, hardware, drapery, and stationery; also some few drugs, and articles of confectionary and drysaltery. The concern having gone much beyond the powers of management of the wheelwright, has been put under the charge of an experienced person, with several assistants. His lordship also erected a mill for grinding wheat, and a bakery for making bread and biscuit; and of these articles, as also

of flour, a large sale ensued, in consequence of the improved habits and circumstances of the inhabitants. The whole transactions in buying and selling are in ready cash.

Soon after the establishment of the store, Lord George Hill began his endeavours to regulate the territorial arrangements. All the old and complex holdings were to be abolished; instead of having his land in disjointed scraps, every man was assured of getting a just proportion, according to his rent, in a single piece. The tenants were all assembled to hear the new measures proposed; and although they advanced innumerable objections, they peaceably consented to allow the allotments to be made; a degree of confidence being inspired in their minds, by being allowed to appoint a committee of themselves to assist in laying out the new farms. When all had been surveyed and laid out, the farms were distributed with the greatest regard to existing interests, and also by casting lots in cases of competing claims. 'It took about three years to accomplish the divisions, as upwards of twenty thousand acres had to be thus arranged and distributed. Altogether, it was a difficult task, and much thwarted by the people, as they naturally did not like that their old ways should be disturbed or interfered with, nor were they disposed as yet to abandon the Rundale system. They did not seem to have a *taste* for simple plain-dealing, or that matters should be put straight, and made easy of apprehension. The greater part of the tenants had to remove their houses, formerly in small clusters, to their new farms. This, though troublesome to them, was not a very expensive affair; as the custom on such occasions is for the person who has the work to be done to hire a fiddler, upon which *engagement* all the neighbours joyously assemble, and carry, in an incredibly short time, the stones and timber upon their backs to the new site: men, women, and children alternately dancing and working while daylight lasts, at the termination of which they adjourn to some dwelling, where they finish the night, often prolonging the dance to dawn of day, and with little other entertainment but that which a fiddler or two affords.'

The only arrangement to which the people made any violent opposition was the fencing of a few ten-acre farms on the waste land. Nothing would induce them to construct the fences, though good payment was offered; and when strangers were employed in the work, they molested them, and pulled down at night what was erected during the day. An energetic display of police force at length quelled this turbulence, and the fences were permitted to stand. The evident improvement in the condition of those tenants who had first got their allotments, helped considerably to allay discontent; and in time the people became absolutely pressing to have land allotted to them in the same manner. When the arrangements were completed, the whole district formed a well-organised system of farms varying in size, each with a cottage attached, and approachable by roads made chiefly at the expense of the proprietor. And as the store carried off the produce, so did the shop furnish the cottages with crockery, pans, bedding, and other articles necessary for domestic comfort.

In order to inspire a taste for neatness and habits of industry, Lord George Hill offered premiums to all who chose to compete in improvements in agriculture, draining, fencing, green crops, breeds of cattle and pigs; also for neat cottages with chimneys, plastered and whitewashed; making butter, weaving woollens, knitting, &c. The first year not a single individual could be induced to compete for the premiums, the people thinking it all a hoax, being convinced in their minds that no gentleman would be so great a fool as to give his money merely to benefit others. No doubt they considered themselves very knowing in not being taken in. In 1840, the tenants observing that any promise made to them was strictly fulfilled, acquired confidence, and some thought they might at all events try the

thing. That year, therefore, there were thirty-six competitors for the premiums, which amounted to L.40, 1s. 6d.; and were so fairly awarded by the judges, that they caused general satisfaction. Every year the number of competitors increased. In 1844 they amounted to two hundred and thirty-nine, to whom L.60 was paid.

Some things were still wanting. The district had no hotel. Here the noble proprietor once more acted nobly: he erected a handsome and commodious hotel at Gweedore, where travellers could be accommodated with lodgings, horses, and cars. Subsequently, a convenient session-house, and an airy and commodious schoolhouse, were erected, and put in operation. To the school a mistress was attached, to teach the girls sewing. In the schoolhouse, on Sundays, divine service is performed by a minister of the established church. Along with other improvements, illicit distillation and intemperance disappeared. Formerly, it was the custom at weddings for each friend or relation of the bride and bridegroom to bring a bottle of whisky: now, this is gone, and each deposits a loaf, or some other simple article of refreshment. With respect to advancement in economic arrangements, the following passages occur in a report by the gentlemen who adjudged the premiums in 1843:—

'We have found a considerable extent of new ground, reclaimed from bog and mountain, bearing good crops of oats and potatoes, and in many places the tenants already attempting the cultivation of green crops, by raising turnips, the value of which, as it becomes more generally known, will no doubt induce numbers of others to follow their example.

'We have to express our satisfaction at the evident improvement in the mode of reclaiming and cultivating the boggy and mountain lands, by draining and spade husbandry, and at the judicious manner in which, under the guidance of his lordship's agriculturist, the exertions of the people are directed, and their time and labour turned to the best account.

'We are also happy to find so much attention given to the home manufacture of woollens, the quality of the cloth of various kinds, and the flannel, stockings, &c. exhibited being most creditable. This branch of industry is, we conceive, particularly valuable, as it gives that employment to the females for which they are peculiarly fitted, and enables them to contribute, in no small degree, to the health and comfort of their families—affording cheap and warm clothing, and inculcating a spirit of exertion among them.

'In nothing, however, have we had such pleasure as in the marked improvement in the dwelling and office houses of the tenants, knowing what difficulties old habits and prejudices present to such changes. Until lately, the people were crowded together in miserable villages, where want of cleanliness, and the impure exhalations of dung-pits close to their dwelling-houses, generated disease and misery. Now we behold in all directions neat and comfortable cottages, attracting the eye by their well-thatched roofs and whitewashed walls, giving an aspect of life, health, and cheerfulness. Nor were we disappointed upon a closer inspection: we found that the interior of the houses fully realised the expectations raised by their exterior appearance—clean, orderly, and well-ventilated rooms, comfortable and suitable beds and bedsteads, with a supply of bedclothing and furniture equal at least to the wants of the inmates, and in many instances showing a taste in the arrangement for which we were quite unprepared.

'These various improvements we consider in a great measure attributable to the division of the lands into separate farms, and placing each tenant's house upon his own ground; one of the great advantages of which is, enabling them to place their dwellings, offices, and manure heaps in the most convenient situations for comfort and cleanliness—advantages of which, it is but justice to the tenants to say, they have fully availed themselves.

'It was peculiarly gratifying to us to witness the respectable appearance and orderly demeanour of the crowds of persons assembled upon this occasion, and the gratitude displayed in the looks and manner, even more than by the expressions, of the successful candidates, when, after the dinner provided for them by his lordship, and his agent had announced the decision of the judges, they approached his lordship and received from his hands the amount of the prizes respectively awarded them.'

We learn by a foot-note that on the above occasion Lord George Hill not only provided dinner for, but dined with his tenants. This was an honour altogether overwhelming. 'The poor people could not believe that they would be permitted to *dine with his lordship!* When assembled outside the house where the dinner was provided, seeing the surveyor, whom they knew, at the door, they anxiously inquired of him "if it was really true that they might go in?"'

Here may appropriately conclude this gratifying and 'eventful history.' A nobleman, abandoning the frivolities of the metropolis, has been seen expending his wealth and his energies on the reclamation of one of the least hopeful tracts of country in the British islands. By dint of benevolence, intelligence, and perseverance, he is successful. Lawless resistance to authority is suppressed—without firing a shot. Poverty is turned into prosperity, intemperance into sobriety, vice into virtue, ignorance into knowledge. While thus benefiting others, we trust that Lord George Hill has equally improved his own fortune by the hazardous enterprise which he undertook, and so courageously brought to an issue. As a lesson to Irish landlords, his example is invaluable, more particularly as his improvements have been carried out at his own cost and risk. Will this example be lost on those who are everlastingly seeking to have *something done for them*, instead of *doing for themselves*?

THE MANTLE OF LOVE.

'Love covereth all sins.'

—Proverbs, x. 11.

'I WISH, mamma, that you would buy me a satin mantle like that which Caroline Morrison had on to-day,' exclaimed Emily Thornley, looking up anxiously into her mother's face as she spoke. 'Did you not remark how elegant it was, and how beautifully it was trimmed with gimp and fringe?' she added, finding her parent did not reply.

'To own the truth, I took no notice of Miss Morrison's dress; my thoughts were too much engrossed by the conversation I was holding with her mother,' Mrs Thornley made answer. 'Perhaps, Emily,' she continued a little reproachfully, 'you were so taken up with your admiration of the mantle, that you did not listen to it: was it so?' Emily blushed, and hung down her head. 'I feared as much,' the lady resumed. 'Now, my dear, I must say that I think you would have been better employed in listening to Mrs Morrison's account of the good effected by the Infant School she has opened for the poor of the village, than observing either the texture or the trimmings of a mantle.'

'Oh, now you remind me, mamma, I do remember all about it; but I was thinking just now how much I should like to have such a mantle, and I forgot for the moment.'

'This is a proof that such frivolous things occupy your thoughts to the exclusion of subjects of utility.'

'No, mamma; one must think of one's dress sometimes; and you know that you were so kind as to say that you would take me with you to town to-morrow for the purpose of buying something of the kind for the autumn.'

'I did, my dear; and I do not intend to disappoint you of a suitable dress for the season: but you must remember that Mr Morrison is more wealthy than your papa, and can afford more expensive dress for his daughters.'

'Oh, I don't think Mr Morrison is very rich, mamma, though Caroline and Georgina always hold their heads up higher than any one else,' Emily interposed. 'Caroline would scarcely notice me to-day, because I was not so smart as she was; and so I should very much like to have such a mantle, if it were only just to show her and her

sister that you can afford to dress me as well as their papa and mamma can dress them.'

'That is an unworthy motive, Emily; and you certainly do not advance your own interest by such a plea,' Mrs Thornley observed. 'I was sorry to find that your thoughts were so much taken up by a trifle, that you could feel no interest in the benevolent cause which formed the subject of conversation; but I am still more grieved to discover that the wish to rival your friend was stronger than your admiration of the article in question.'

'Well, mamma, but everybody says how proud the Misses Morrison are.'

'I never observed it; and I am of opinion that your everybody consists of some few envious girls, who, like yourself, Emily, have the desire, without the means, of making a similar appearance.'

'Oh no; indeed I do assure you it is so, mamma.'

'Well, we will not dispute the matter, my dear; but I should much like to see you possessed of a mantle which would become you better than the one Miss Morrison had on to-day.'

'You mean something plainer and more durable, mamma?'

'I mean something more durable, Emily; but one which would be at the same time more beautiful.'

The little girl looked astonished. 'What can be more beautiful than that richly-figured satin?' she interrogated.

'The mantle I refer to,' the mother resumed, 'would make you appear more attractive than the richest satin could do; and it would at the same time afford you more pleasure than the ungenerous and unnamable gratification of competing with your friend. I allude to the Mantle of Charity or Love.' Emily looked disconcerted. 'This mantle,' continued Mrs Thornley, 'would lead you to remark the estimable qualities of those around you, rather than their failings; and as it is much more gratifying to the feelings to contemplate that which excites our admiration, than those actions which arouse resentment or indignation, you would yourself be the gainer by it.'

'But we cannot avoid seeing people's faults when they are so very obvious,' Emily interposed.

'They may not be so obvious to one who is not predetermined to observe them; of which a convincing proof has this morning been given. I saw not the slightest indication of pride in Miss Morrison's demeanour; but, on the contrary, observed with great pleasure the lively interest she evidently takes in the plans of benevolence her parents are executing. It is most probable that this circumstance was the real occasion of her seemingly distant manner towards yourself. Thus you see, my dear girl, I who was looking for her good qualities, readily discovered them; whilst you, having your thoughts full of envy, not only failed to see what was truly estimable, but committed an act of positive injustice, by putting an unfavourable construction on the motives which actuated her conduct. Now, which think you derived the most pleasure from Miss Morrison's presence—I who was admiring, or you who were condemning?'

Emily answered by a flood of penitential tears.

'Let this be a lesson to you, my child, not to be too hasty in your censures,' the mother resumed; 'for where you are not capable of forming a correct judgment of the motives or actions of others, it is better to err on the side of charity, by which means you avoid wronging your fellow-creatures, and at the same time afford yourself a gratification for which no malevolent feelings can compensate.'

RICH AND POOR.

The envy and hatred with which the hard-working poor contemplate their more fortunate neighbours, would be much mitigated, and perhaps altogether extinguished, if they could be brought to reflect that, in a commercial country such as England, opulence and indigence are, in a majority of cases, the direct results and representatives of poverty and industry. For what does any man toil except to purchase an exemption from toil? What is the stimulus and support of a poor man? The hope of becoming rich. If the Hindoo system of castes prevailed among us—if the humble man, however gifted, could never expect to emerge from his obscurity, he might justly complain of his lot; but in no country is the road to distinction more unobstructedly open to all classes than in England. The fathers and

grandfathers of some of our wealthiest gentry, and of the most eminent of our living statesmen, have been mechanics and artisans. From the nature of things, these grand prizes in the lottery of life can be only gained by a few; but if every man has a chance, it is as much as he has any right to expect. All poor men try to get rich; and it is no injustice to the many that only a few succeed. Drudgery and dependence are doubtless evils; but it is a great mistake to suppose that opulence is always a good.—*New Monthly Magazine*.

A GOOD TRUTH WELL STATED.

We regard man as a progressive being, and capable of being lifted by moral and intellectual culture to a far higher position in the scale of being than he has yet occupied. Classes and communities may be rough and rugged, and even reckless, but they are capable of improvement—they have heads to think, and hearts to feel. They can be reached by kindness, and are soon able to distinguish between the man who courts merely to make tools of them to serve his own personal or political purposes, and the man who seeks, from no self-interested view whatever, not to court, but to counsel them, and to tell them the truth in love—though the truth he tells may be frequently disagreeable for them to hear.—*Airdrie Advertiser* (a new monthly paper).

FLUENT SPEAKERS.

I have heard of some whose boast it is that, on any given topic, they can speak for any given time; even as Lucilius used, standing on one foot, to make two hundred verses, quality being, in either case, 'no object.' I have asked to what use is this power applied, and I have been told of some 'neat and appropriate' after-dinner advocacy of a patriotic and popular sentiment, amidst much jingling of phrases and great applause; or of some pathetic exposition in a debating club of the wrongs of the Scottish Mary, and the cruelty of her decapitation. I have listened to such, and if they were fair specimens of their class, there have been much well-considered gesticulation, much not unimpressive play of countenance and modulation of voice, 'periods well turned,' and 'points well made;' but no earnestness, no sincerity, no soul. The words rang hollow; they seemed to come from, rather than from out, the speaker; from the 'outer wall of the teeth,' not from the citadel of the heart. They were a reflection not of the speaker's thoughts, but of what he thought that the hearers thought his thoughts should be. And when the exhibition was over, there was left no distinct or strong impression; no lesson had been taught, but (most unconsciously) that of the worthlessness of words, when they are only the ornamental cenotaphs of thought. To persons of this class the abolition of some good stock grievance, if they meddle with such, is a sad calamity; it narrows their vocation, and puts them on 'short time.' But, generally, it is only against obsolete oppressions that they wax indignant; it is only for widely-admitted utilities that they contend. Applause, the breath of other men's nostrils, by which they live, would be more scarce, if they could not denounce or plead without offence to any. To all such let there, in every sense, be peace!—*Dr W. B. Hodgson's Address to the Mental Improvement Society of the Liverpool Mechanics' Institution*.

SONNET.

ON HEARING THE CLOCK STRIKE AT MIDNIGHT ON THE
31ST DECEMBER.

BY LEITCH RITCHIE.

HARK! In that dirge-like peal what magic lies
To move me thus? Unwilling thoughts that come,
Like long-laid ghosts from some forgotten tomb,
Tell me what potent spell hath said, Arise!
Yet stay awhile, ye dreams that my young eyes
Once loved to rest on; linger smiles, and tears
Far sweeter: but the shadow of lost years,
Mingling with darker clouds, already flies.

So, when a few faint notes of distant song
Pass o'er the heart of some lone traveller,
Like sounds he once had loved, the echoes there
Are straight awakened, that the tones prolong
One busy moment: soon 'tis heard no more,
And the cold heart is silent as before.

FIFTEEN YEARS AGO.

FIFTEEN years have now elapsed since the commencement of our literary labours. The present number of the Journal is the beginning of our sixteenth year. Fifteen years are a considerable section of time, and witness many changes which, however inadequately appreciated as they occur, assume a degree of importance in the retrospect. We may be said to have seen two generations change their character. Those who, fifteen years ago, were babies dandled in the nurse's arms, are now young men and women about to enter into active life; those who were boys, are now men; lads just emerging from school and college, are now grave papas of thirty years and upwards; misses with red shoes are no longer romps, but mothers of families, engaged in the high consideration of finishing establishments for daughters and professions for sons. Our sheet is now read by the children of those who were children when we entered on our career. By many our paper must be looked upon as a prodigiously old concern: they will profess having seen it as long as they can remember. 'I have read you ever since I was a boy,' said a gentleman of portly bearing to us one day. The lapse of time had never before been presented so palpably to the eye. We began forthwith to consider ourselves as somewhat aged persons.

And yet the progress of years is felt by us in no other way than in the consciousness of an increased desire to work out the purposes for which the present work was established. It is now so long since we told what these purposes were, that many who have not followed us from the commencement are apt to form incorrect impressions on the subject, and to recommend plans inconsistent with our principles of management. In the Editor's address to his readers (February 4, 1852), it was intimated that the object of the publication was to 'take advantage of the universal appetite for instruction which at present exists; to supply to that appetite food of the best kind, and in such a form, and at such a price, as must suit the convenience of every man in the British dominions. Every Saturday, when the labourer draws his humble earnings, he shall have it in his power to purchase, with an insignificant portion of even that humble sum, a meal of healthful, useful, and agreeable mental instruction: nay, every schoolboy shall be able to purchase, with his pocket-money, something permanently useful—something calculated to influence his fate through life—instead of the trash upon which the grown children of the present day were wont to expend it. The scheme of diffusing knowledge has certainly more than once been attempted on respectable principles, by associations established under all the advantages of an extensive capital, as well as the influence of baronial title, and the endeavour has generally been attended with beneficial results. Yet the great end has not been gained. The dearth of the publications, the harshness of official authority, and, above all, the method of attaching the interests of political or ecclesiastical corporations to the course of instruction or reading, have, separately or conjunctly, circumscribed the limits of their operation; so that the world, on the whole, is but little the wiser for all the attempts which have in this manner been made. The strongholds of ignorance, though not unassailed, remain still to be carried. Carefully eschewing the errors into which these praiseworthy associations have unfortunately fallen, I take a course altogether novel. Whatever may be my political principles—and I would not be in the least degree ashamed to own and defend them—neither these principles, nor any other, which would assuredly be destructive to my present views, shall ever mingle in my observations on the conventional arrangements of civil society. Nothing could afford me more unmitigated pleasure than to learn that CHAMBERS'S EDINBURGH JOURNAL yielded equal edification and delight to the highest conservative party in the state, and to the boldest advocate of a universal democracy: or was

read with as much avidity at the cheerless firesides of the Irish Roman Catholic peasantry, as at those of the more highly cultivated Presbyterian cottars of my native land.'

This frank avowal that our paper was to be addressed to *all*; that it should, as far as possible, avoid topics and allusions of a controversial nature, met with general sympathy and approbation; and it seems scarcely necessary to explain that, by adhering to these maxims throughout, while keeping at the same time ahead in questions of social economy, the work has attained its well-known large circulation, and has survived amidst the wreck of numerous competitors.

With these good results before us, it would surely be highly unwise now to alter our plans, in order to please the fancies of any sect, party, or individual. It is our firm conviction that any attempt to do so would be attended by failure. The many would be lost for the sake of the few who would be gained, and the work would soon dwindle into deserved insignificance. So much we say in all friendliness to those who seem inclined to fasten upon us functions for which we have no vocation. No, no; we must decline usurping the mission of the politician and the divine; we must leave the newspaper and the evangelical magazine to follow out their respective aims. To us, be it enough that we hold by the original charter of our constitution. CHAMBERS'S EDINBURGH JOURNAL shall never be written for this or that country, or to meet this or that fashion of opinion, but remain to the end what it has been from the beginning—a LITERARY MISCELLANY, aspiring to inculcate the highest order of morals, universal brotherhood, and charity; to present exalted views of Creative Wisdom and Providential Care; and to impart correct, or at all events earnest and carefully formed, ideas on subjects of economic or general concern; endeavouring at the same time to raise no false expectations, to outrage no individual opinion, and to keep out of sight everything that would set mankind by the ears.*

It is so far favourable to the performance of these resolutions, that our task is becoming daily more easy, in consequence of society having outlived differences which used to excite hostile and unpleasant emotions. Much clearer views are now also entertained on subjects that were formerly treated with comparative indifference. Great, for example, have been the advances since 1832 with respect to the accountability and punishment of criminals, the treatment of the poor and the insane, the temperance cause, the education and management of infants, the preservation of peace and repression of war, the commercial intercourse among nations, the transmission of letters by post, the abolition of exclusive monopolies and privileges, the slave trade and slavery, the shortening of the hours of

labour and other means of insuring health, the sanitary improvement of towns, and, generally speaking, everything which tends to elevate the mental condition of the people. With regard to the advances contemporaneously made in the arts, they are in themselves a wonder, and inspire the highest hopes of what is yet in store for busy and energetic-minded England. It is not the least remarkable fact in relation to these movements, that not one of them was projected or primarily assisted by any statesman, university, corporation, or other influential power. Even men of reputed learning had little or nothing to do with them. The whole were the suggestion of thoughtful persons moving in no high sphere of life. Opinions first combated as visionary, were afterwards embraced as truths. The press—that modern marvel—caught the general enthusiasm; and finally, statesmen and legislatures yielded a lagging adherence to what half the world had long since given their assent. The work of social, moral, physical improvement has, in a word, been of and by the people. Logic has not done it, mathematics have not done it, classical learning and endowments have not done it. The industrious and almost self-taught section of the people of Great Britain have alone done it. The honour is entirely theirs. How curious a tale to be hereafter told by the historian, that the great steps in civilisation which marked the second quarter of the nineteenth century were in no respect promoted, but actually retarded, by ministers of the crown; by all the learned bodies, so called; as well as by nearly every individual who, by his wealth, rank, or station, might have been reasonably expected to aid in the movement!

The necessary meliorations are not all completed. Society is only growing up to a due perception of many things which it is desirable to rectify for the sake of general happiness. The question of national education cannot now rest till divested of narrow views, and placed on a broad practical basis. This, we expect, will be the great work of the ensuing ten years. The condition of the accumulating masses of poor in large towns is likewise a problem requiring much consideration. A reorganisation of rural management is evidently necessary, for it is intimately connected with the subsistence of the people. Along with this, the game laws and laws of entail will require considerable modification. The practice of interring, and also that of having abbatoirs, in towns, are discreditable to the age, and cannot long endure. Why there is no system of registration for heritable property, no proper or safe receptacle for public records, and no public prosecution for offences, in England, while Scotland has all these, excites a reasonable degree of surprise. So also is it unaccountable, that while England is provided with a general system of registration for births, marriages, and deaths, there is nothing of the kind in Scotland, and neither has the latter country any coroner's inquest. More than one-half of all the public charities and philanthropic bequests, in England, are in a state of abeyance and dilapidation, for lack of a vigilant and controlling power. The committing of nearly the whole business of public conveyance to private and practically irresponsible companies, is already felt to have been a grievous error in legislation. Other things requiring to be considered and amended will occur to every one. So far as any of these momentous questions fall within the scope of our paper, they will as usual engage a due degree of attention. Nor will less interesting matters connected with the feelings and affections, along with all proper subjects of amusement and instruction, cease to form a principal part of our material. While helping the world on its way, in as far as our poor abilities serve, we can still promise to entertain the young, to cheer the desponding, and to recommend love and kindness among all.

* Pursuing a similar line of policy with respect to our EDUCATIONAL COURSE, we have found that series of school-books (to which particular sects find no difficulty in supplementing their own doctrinal treatises) adopted in India and other countries, where books constructed on a different plan would probably have been excluded. A gratifying instance of this wide acceptability has just fallen under our notice in an Indian newspaper, 'The Bombay Witness' for October 8, 1846:—'CHAMBERS'S MORAL CLASS-BOOK, translated into Marhatta by Hurree Kesowjee, 226 pages, royal 8vo. This work is a valuable addition to Marhatta literature, and we are rejoiced to see the translation from so skilful a hand. The subjects discussed are most important; and the instruction is communicated, not in a dry didactic style, but for the most part by means of fables and anecdotes—a method peculiarly adapted to the present state of the native community. The following are the titles of some of the chapters—Conduct towards Animals, Conduct towards Relations, Industry, Modesty, Temperance, Contentment, Benevolence, Conscientiousness, Truth, Love of our Country, &c. The work has been prepared and published at the expense of the Board of Education, and is sold at one rupee and twelve annas per copy. As the translator has endeavoured to follow the original closely, it will be found useful to those engaged in the study of English, and to Europeans who are studying Marhatta.'

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 96 Miller Street, Glasgow; W. S. ORR, 147 Strand, and Amen Corner, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 158. NEW SERIES.

SATURDAY, JANUARY 9, 1847.

PRICE 1½d.

CIRCUMSTANCE.

Near a large inland town in England there is a line of aristocratic-looking villas, interrupted by gardens and pleasure-grounds. The most distant of these is likewise the most ancient—having been built in the time of the last generation; and, accordingly, it has hardly anything of the card-board appearance which so often distinguishes the edifices of the present day. Its grounds, besides, are more extensive, and more finely-wooded, than those of its neighbours; and, taken altogether, were it not for its façade forming nearly a line with the public road, it might well seem entitled to the name of a gentleman's seat.

This house is a favourable specimen of that class of the 'homes of England' to which it belongs; namely, the abodes of the wealthy and respectable families, who spend their fortunes in the towns where they have made them; only retiring a little way from the bustle of the streets, and surrounding themselves with the comforts which, having earned by their industry and integrity, they have a right to enjoy. The interior at this moment presents a picture of the quiet yet somewhat luxurious respectability which might be anticipated from the outward aspect of the house. It is far on in the evening, but the family are still enjoying the long twilight, helping it a little with one of the earliest fires of the season. They consist of a lady and gentleman, persons of middle life, and several children and young people; all taking advantage of the holiday interval between daylight and candlelight to do as little, and feel as comfortable, as possible. The father might seem, at first sight, to form an exception; for he is walking in silence up and down the floor: but this is only a habit—and every now and then he pauses in the midst of his meditations to look at his wife and family, in their large and handsomely-furnished room, and then at the evening out of doors, gathering dark and bleak round the common, and to feel, without expressing it, a deep thankfulness to God for his position.

'Papa,' said one of the children who was standing at the window, 'the man is still there: he is sitting on the chain.'

'Is he?' replied the father vacantly, and he continued his silent walk.

'He is now leaning against the lamp-post,' said another by and by; 'he looks so lonely!'

'Perhaps he is very poor,' remarked the eldest girl softly, who was sitting by the fireside. 'Mamma, I daresay, will allow you to give him some bread and cold meat?'

'Do you think, papa,' said the little boy, who was still gazing earnestly out of the window—'do you think that man has any house to go to, or any children, or any friends to care for him? He looks so very, very

lonely!' The father, thus appealed to, stopped at the window mechanically, and looked in the required direction. He had himself observed the man, though half unconsciously, for a considerable time. There seemed to be some fascination for this stranger about the spot; for he had returned to it again and again during the evening, now looking up at the house, and then round the common, which was bounded by the road before it. Before the warmth of day had been entirely lost, he had occasionally thrown himself down upon the grass; but when the air became chill, he had walked along the road, or leant upon the chain which connected the row of chestnuts before the house, or reclined against the lamp-post. The master of this luxurious abode began to look as earnestly as his little boy; but when the man was taken in to receive the suggested donation of food, his eyes still continued fixed on the same spot, and it was evident that he was in a reverie, which had probably no connexion with the things or persons before him. Presently he resumed his walk, but in deeper silence and abstraction.

'Papa,' cried one of the children, bursting into the room, 'I am so glad! The man is hungry, and we have made him sit down in the hall, and he eats so fast!'

'He knows your name,' cried another; 'but he says you must be very old—and of course you are.'

'Nonsense!' interrupted the mother; 'he must take your papa for somebody else of the name.'

'To be sure he must,' said the little boy who had remained so long at the window; 'for he asked if you had any nephews——' Here the father started so violently, as to attract the attention of the whole group.

'Go on,' said he in a troubled voice.

'And when I said no, that you had never any nephews, he started—just as you did now!' The father turned away, and resumed his walk, but his pace was at first broken and hurried. He became calm, however, by degrees; and it was in his usual tone he desired them to ring for lights to the library, and to send the man to him there.

The library was an oblong octagonal room, with well-filled bookcases reaching on all sides to the lofty roof; and the idea of scholar-like seclusion was rendered complete by the inner side of the door being covered with imitative volumes, corresponding in appearance with the rest; so that, when it was shut, there seemed to be no means of ingress or egress, except by the large and lofty Gothic window looking into the garden. A lamp depended from the roof by a chain, and its shaded light brought out unobtrusively the gilding of the books and bookcases. A pair of lighted wax candles stood on the study-table near the fire, and beside it, seated in an ample library chair, the master of the house awaited the appearance of his destitute guest.

The man presently entered the room, and shutting

the door gently behind him, gave a quick, curious glance round the walls, and advanced slowly to the table. He was probably not older than his host, but the hair of the one was only grizzled, while that of the other was gray. The brow of the one was smooth, while that of the other was deeply indented, not by the parallel lines of thought or study, but the irregular wrinkles of anxiety, passion—perhaps crime. The one had a calm, reflective eye, and a mild though determined expression; while the glance of the other, full of fear mingled with defiance, was habitually restless, bespeaking a life of vicissitudes and expedients. The one was dressed with a precision bordering on the finical, and betraying the nicest discrimination as to the requirements of that middle period of life with which the gaiety of youth is as inconsistent as the gravity of old age; while the other was buttoned up to the throat in a threadbare black coat, scanty in dimensions, and yet permitting—perhaps for a good reason—no vestige of linen to be seen. The two gazed for some time into each other's eyes.

'Even so, Walter,' said the master of the house; 'it is thus we meet!'

'And as if we had never parted,' replied the guest, 'but for an hour or a day! Why, it seems as if there was not even a book out of its place! Nothing is changed but ourselves; and you are only changed by having become some twenty years older; while I—how is this, William—*cousin* William,' continued he passionately, 'why is this? What was the difference in our crime which has made this difference in our fortunes?'

'I can tell you *how* it is,' said William calmly, 'but not *why* it is; and even after we exchange revelations, I am of opinion that we shall still be in the dark.'

'No matter; I am curious to hear, and I shall not hesitate to tell. I have nothing to conceal; no motive for concealment; no house, no home, no family, no fortune, no respectability! I am more independent than you. Ha! ha! Proceed.'

'When we arrived at Liverpool,' said William slowly, like a man whose mind is busy in endeavouring to recall the past—'after—'

'I know, I know: go on. Our uncle was cold and harsh. We were treated more like slaves than assistants in his business and portions of his blood. We were, besides, young, sanguine, adventurous. The manners of the day and the place led us into dissipation; and if we did take what he ought to have given, and only a portion of what he would have left us at his death—Go on; I understand. When we arrived at Liverpool—'

'After robbing our uncle.'

'How!—this from you!—and Walter's eyes travelled unconsciously round the beautiful library.

'It is merely the truth. It was our intention to proceed to some foreign country, with the vague notion of pushing our fortune—'

'And of sending back to our uncle, as soon as it might be in our power, the money we had made our stepping-stone. Do you forget that?'

'Pshaw!'

'Why, William, you are a worse reprobate than I! I cannot think of my first felony, even when alone, without summoning to my assistance all the excuses I can find.'

'My plan is different. When we arrived at Liverpool it was late, and we went to bed in the same room. I could not sleep. But it was fear that haunted me, not conscience. At every sound in the house I started in affright; and when, in the middle of the night, I heard the street door open, and a heavy, stern-sounding foot ascend the stair, the bed shook with my tremor. How I envied you! I might have thought, but for your deep breathing, that you were dead; and in that case I should have envied you still more. But at length the dawn came; and by degrees the rising hum of the great town; and then my wearied senses sunk into repose. When I awoke, I was alone!'

'What was your first thought?' demanded Walter suddenly.

'That you had robbed me in turn.'

'Ha! ha! ha!'

'The idea, under the circumstances, was natural—nay, unavoidable, in our state of mutual crime; but it turned out to be incorrect. My share of the booty was safe; and I concluded that, not wishing to disturb me, you had gone out to inquire about the sailing of a vessel. An hour passed away—two. What could have become of you? Had you determined to shake off the association of a companion you could not trust? Were you now on your way to some other seaport to escape from me? Or had you been arrested in the street, and carried to jail? If so, would you betray me? These were the questions that coursed each other through my mind; and at last a loud knocking at the door of my room threw me into an agony of terror. "*The coach for — goes at twelve!*" cried a rough voice. How my heart leapt! The name of my native place brought with it a thousand associations; and my dead parents seemed to pass through the room, followed by every acquaintance I had in the town, and at last, closing the *cortège*, by my uncle: all bending eyes of sorrow, wonder, and reproach upon me as they glided away and disappeared. I buried my face in my hands and wept.'

'No!—did you? I see it now.'

'This tranquillised my spirit, and dressing myself hastily, I went out in search of you. I roamed through the principal streets, and along the interminable docks, fancying every moment that some one turned to look at me, and more than once darting into a lane, as I saw in the distance a figure which I persuaded myself I knew. At length I found my way back to the inn. The room was still solitary. Nothing was there but the things and persons of the past; and sitting down in the midst of the spectral show, ghastly, trembling, and bathed in a cold sweat, I gave myself up for a time to all the horrors of my situation. I was startled from my reverie by another loud knocking at the door of my room; and the rough voice cried this time—"*Only five minutes to twelve!*" Here William wiped his brow with his perfumed handkerchief.

'Go on,' cried Walter impatiently.

'I cannot tell precisely what followed. I have a confused recollection of rushing down the stairs; of forcing my way through a crowd; of being cursed and struck for my rudeness; of shouting after the coach, which had just started, till my brain reeled and my voice was lost. When I recover the thread of my narrative, I am on my way to this place at the rate of ten miles an hour.'

'Never mind the thread of your narrative,' interrupted Walter moodily. 'You confessed; you laid the blame upon me; you were forgiven—and there is an end.'

'Would that such had been the case! But I did not confess, because I knew that I should not be forgiven. The door being accidentally ajar, I made my way to my own quarters without being seen, first stealing into this room and replacing the money. No one came to look after me, for no one knew that I was in the house. I heard hour after hour strike; the daylight vanished by degrees; and when it became utterly dark, I crept shivering into bed. Fatigue, terror, agony of mind, and hunger—for I had eaten nothing all day—did their work; and I was found by the servants the next morning in a raging fever. From that day to this I never was asked a single question upon the subject! My impression is, that the vague guesses of the servants were received by my uncle as authentic information; that it was supposed that, on hearing of your flight, I had pursued, in order to bring you back, and that mortification and disappointment had occasioned my illness.'

'Was there ever fortune like this? Why, you might have kept the money, and it would have been supposed that I had taken the whole. And perhaps you did? Come, let us not have half confidences; only wait till I get to mine!'

'You forget,' said William gently, 'that I am here—and thus. But if you will not believe your own eyes, where is the use of my words? There are witnesses, however—hark!' and a knock was heard at the door, accompanied by a confused babble of small voices. It was the young children, brought by the nursemaid for the kiss of good-night; and in they walked, or tottered, according to their ages, with their snowy nightgowns, and white caps tied under their chin, and their rosy faces, dimpled with loving smiles, as they held up their little mouths to their father. Some of them offered their hands to their acquaintance of the hall; but the rough, shabby, destitute-looking man turned away to pore intently on the fire; although, when the door closed upon the children, his heretofore accomplice could see that his whole frame was shaken with silent sobs.

'I have little more to tell,' continued William. 'My illness gave me time for reflection; and the thoughts of my crime, though at first a spectre to affright, became at length a beacon to warn and to guide. My uncle seemed cold and stern to the last; and yet I often think that I should have found some opportunity of unburthening my heart, if an illness of any duration had preceded his death. But he was called suddenly away when I was still a very young man, and before a more mature observation of the world had led me to perceive how mistaken youth frequently are in their estimate of the supposed austerity of age. At his death, I found myself the heir of his business and property; and I had the misery of discovering, by the kind yet solemn terms of his will, that I had all along misjudged him—that his coldness was merely superficial, the result of hard experience and habitual thoughtfulness. In short, I married; I became a father; and I—'

'And you forgot,' added Walter bitterly, 'that you were once a—'

'Felon! Never. The fact is proved, as you will soon learn, by my name being well known in the annals of this town—I may say of this kingdom—among those of the men who have worked hardest for the prevention of crime and the reformation of criminals.' Walter rose hastily from his chair, and took two or three turns up and down the room, with long irregular strides, crushing his hands within each other. He then sat down again gently, almost timidly, and began his relation in a low voice.

'When I awoke,' said he, 'on that memorable morning in Liverpool, it was some time before I could understand where I was, or what had happened. Our scheme, you know, was not a sudden one; we had accustomed ourselves to it by degrees; and I had come to think it at least an off-hand, dashing, spirited affair. But that room was so silent! The hum of the town circled round without entering it, as it were; and you—you were like a corpse; white, ghastly, mute, motionless, dead. I could not breathe. I jumped up with a sensation of choking. I threw on my clothes violently: I would not awaken you *intentionally*; but I dragged about the chairs; I coughed, whistled, sung! and at length, enraged at your insensibility, I went forth to gasp in the open air. No warning met my ear—no messenger from Heaven gave me tidings of the coach—no mystic voice came to aid the whisperings of my conscience and my heart! A dull, gray, heavy sky hung over the town; the streets were crowded with phantoms whom I knew not, and who knew not me; the rush of the carriage wheels was as the rush of the viewless winds over a desert. I was suddenly asked, as I leant over one of the piers, looking into the dull waters, whether I would not lend a hand for a half-hour's trip; and descending mechanically into the boat, I soon found myself, with a single companion, going down the river before the wind.'

'Then, after all,' said William with curiosity, as the narrator paused, 'our separation was accidental? But how did you get to that foreign climate which has left such eloquent tokens upon your complexion?'

'You shall hear. The wind, which was with us going down the river, was against us coming back; and as it had increased in force, the proposed half-hour, notwithstanding all our exertions—growing more and more frantic on my part, as the time passed on—became at least three hours before we regained the pier. A misgiving, I could not tell of what nature, came over my mind, as I threaded my way through the streets to the inn. Still there was no warning; I heard no voice louder than another among the inarticulate murmurs of the town; and when a church clock struck *twelve* as I passed, it fell upon my heart, not like a peal for the living, but a knell for the dead. Before the sound was well out of my ear, I was once more in the deserted room—alone in my guilt, friendless and companionless in my despair!'

Up to this moment there had been something almost touching in the tone of Walter's voice—it seemed as if the young children had left some holy influence in the room. But here, smiting the table suddenly with his hand, he continued his narrative in a hoarse rude voice, and with an air of the desperado, so marked, that it might have seemed in part assumed. William in the meantime sat watching him with a calm and deep attention, on which not a tone or gesture was lost.

'Well, what was to be done. I was now alone—mark that—*alone*! There was not a human being in the world to whom I was not an object either of indifference or execration—who would not either have passed me by as a stranger, or arrested me for a felon. This is rarely the case even with the worst of criminals. Even in the bush of Van Diemen's Land—and I know Van Diemen's Land!—the ranger herds with the savages when he is cut off from his own fellows. Now, look you here. I went to London, when at length I had made up my mind that you had thrown off *one whom you could not trust*, and gone to try the world on your own account. But in London I was still alone; though not long! There is only one kind of society there that is freely open to the uninitiated; and that is the society of the depraved and the desperate. And what was I, that I should scorn such a resource? I was like yourself: I remembered that I was a felon; but I remembered it under different circumstances. I bethought myself that every shilling I spent was the produce of theft, till crime became a portion, as it were, of my existence! What could come of this when my money was spent—when, enervated by vice and misery, I could no longer look for employment—when the comrades of my brute enjoyments jeered me alike for my poverty and my cowardice? What could come of it, I say?'

'You had two courses; and notwithstanding your dreadful experience, you deliberately chose the worst.'

'That is false! It was not through deliberation, but in a fit of madness, aggravated by drunkenness, that I became a housebreaker! I was seized in the midst of my first crime—tried—and cast for fifteen years' transportation. The judge said it was a bad job. Perhaps he was right; that I know little about.' Walter's voice here became faint. The paroxysm to which he had wrought himself up was past; he had told the worst, and felt the worst, and he now went on in a subdued tone.

'I have little more to tell; for as I look back on these fifteen years, there is hardly one incident that, at this distance of time and place, appears to be distinguished from another. I believe I "behaved well;" at least I got a ticket of leave as soon as it could be legally granted. After the term was over, I tried to do something in Hobart Town; but it was not to be. I was ill—I was home-sick—I lost everything—even hope; and when I arrived in London a few weeks ago, I had no means, even of temporary support, but my apparel. I knew no one; I looked for no one; I felt like a man in a forest.'

'Then you came hither on the chance—'

'Of obtaining charity? No. I knew no one here any more than there. But this spot was England to me—'

this was my home for which I had sickened—this was my country! The object of my journey was not accomplished till I came here. But when I did come, I saw nothing more than walls and trees. I lingered beside them simply because I had nowhere else to go. That is all!

When Walter had finished his narration, he again looked round the beautiful library, then at the door, where he saw in imagination the young children, and their warm, loving smiles; and with an unconscious shiver he rose up, and pressing more closely the collar of his threadbare coat round his neck, seemed about to move slowly away. The earnest look with which William had been regarding him softened, and his eyes were suffused with that manly softness which in gentler woman is turned into tears.

'Sit down,' said he, 'my poor friend—my unhappy accomplice! We were separated for the good of both, and we meet again to complete the plan of a higher, wiser Power. A circumstance the most inconceivably trifling, the most apparently fortuitous, gave a different colour to our whole fortunes—a different direction to our whole lives. As a stone interposed in the course of a stream divides it in two, sending one portion through a garden and the other through a desert, so that circumstance made you a convict, and me—what you see. I was placed in circumstances where the wildness and indiscretions of youth were subdued, and my heart touched and changed even by prosperity; while you were permitted to pass from folly into guilt, that your more masculine nature might be wrung by its invariable attendant—misery. Sit down, Walter: let us be thankful for even the worst of the past, and look forward bravely, hopefully, confidently to the future!'

Twenty years before, we have said, these two had sat in the same room; and twenty years after the present meeting they were still occasionally there together. But the same difference continued in their appearance and position. Walter was for many years the governor of a neighbouring prison, his cousin (never known as such) being security for him to a considerable amount; and he was highly respected in the country-side both for his firmness and humanity. They are now both dead; but though sleeping in the same churchyard, their relative rank is undisturbed. There is a tomb, which is one of the lions of the place, bearing an inscription commemorative of the talents and virtues of the deceased, and of his public services in the prevention of crime and the reformation of criminals. Near it is a plain slab, recording merely the name and age of the dead. And even this humble legend is nearly effaced by the footsteps of the visitors, who stand upon it to view the more remarkable monument. These are the tombs of the two felons.

VISIT TO THE BICÊTRE.

As superintendent of an asylum for the insane in one of the northern counties of England, I had for some time felt desirous of visiting Paris, for the purpose of examining the methods there pursued for cultivating the faculties and improving the habits of children of naturally weak intellect. This visit I was lately able to perform; and considering that what I saw may be usefully made known in my own country, I beg leave to do so through the medium of the *Edinburgh Journal*.*

The principal establishment for the reception of idiot children at Paris is the Bicêtre, a large hospital pleasantly situated on a rising-ground a short way from town. Aware that the French begin their labours at an early hour,

and anxious fully to examine the subject which attracted me to this famed institution, I set out from my hotel soon after break of day on a fine autumn morning in the month of October. Before reaching my destination, the sun had completely risen, and shed his beams over the stately and venerable old palace, which, placed on a gentle eminence at the end of a long avenue of trees, formed a striking and imposing pile. Soon after passing the massive portals which form the main entrance, I found, on making inquiry, that I had arrived fully two hours before the time of opening the school for idiots. This circumstance, though causing a little loss of time, gave me, however, the opportunity of first walking through the whole establishment, and also of inquiring very narrowly into the state of several congenital idiots, who were loitering or playing in the yard adjoining the building devoted to their reception. After strolling about for some time, I stepped into one of the rooms, where several of the young inmates were separated from their fellows, owing to the prevalence of an epidemic ophthalmia which had recently broken out among them. The greater number were placed in bed, and were receiving the attention and appliances which their present condition rendered necessary. Three of them, who had recovered from the ophthalmia, were seated at a small table, partaking of excellent soup. They sat in an orderly and decorous manner, and took their food without scattering it or smearing the person—a circumstance nearly always observable in the neglected idiot. At the request of the interne, who kindly accompanied me, the youngest of the three rose from his seat, and repeated one of Lamartine's fables very distinctly, and with much spirit. During this recitation the others ceased to eat, and appeared to listen with pleasure to the display made by their young friend. Conceiving that this child manifested a precocity and irregularity rather than a deficiency of intellect, I intimated my wish that his cap should be removed, so that I could have the opportunity of examining the shape of his head. He immediately made the attempt to comply, but finding that the strings had become knotted under his chin, he showed some signs of impatience at the obstruction. One of the idiots, seeing his difficulty, rose from his seat, and rendered him the necessary assistance, by carefully untying the knot. I remarked that this youth, who thus noticed the dilemma of his companion, and then immediately relieved him, had all the characteristic appearance of a genuine idiot. I could not observe this simple occurrence without becoming at once sensible that much had been done for these poor creatures, who, born with an imperfect mental organisation, have been made capable of exercising the faculties of observation, comprehension, and a power of application, which, a few years ago, it would have been thought impossible to communicate to them.

After waiting a little while, the arrival of M. Vallée, the courteous and spirited instructor of the youths, was announced. I was conducted by him to a spacious room, in which were assembled about forty idiots. They were arranged along three sides of the room, and were standing still in a most orderly manner. The majority of them appeared to be about twelve or fourteen years of age; a few seemed to be not more than seven or eight; and a still smaller number had perhaps reached their twentieth year. There were no indications of impatience, no involuntary movements, gesticulations, nor any of those disagreeable moaning whining sounds known to be common among this class of persons. All seemed attentive, and ready to enter upon their exercises. I cast my eye around the room, with the view of ascertaining, from external conformation, whether the young people standing

* This paper has been forwarded to us from a respectable quarter, and though referring to a subject already noticed in these pages (No. 514, first series), its importance to society, not to speak of its consolatoriness to many an unhappy parent, induces us to give it a place.—ED. C. E. J.

before me were truly congenital idiots. I recognised a few who had previously attracted my attention as having all the characteristics of this class in a marked degree, and most of the others presented similar indications, such as stunted growth, small and peculiarly-shaped head, and singular form and vacant expression of countenance. Satisfied that I saw before me a number of human beings born with that species of imperfect organisation in which the understanding does not become developed, I waited with no small interest for the commencement of their exercises.

At the request of their kind master, two of the younger boys advanced from the line in which they were arranged, and stood forward towards the centre of the room. Each placed his arm over the shoulder of the other without any degree of awkwardness or unsteadiness, and they remained thus for a short time, standing in an easy and graceful posture. At the sound of excellent music, played on several instruments by three or four old men, they began to dance; first performing a slow movement, and afterwards a quicker step. During the whole dance, each rested his arm embracingly on the shoulder of the other; and it was pleasing to observe the grace and uniformity of their various movements, as well as the accurate time kept by both to the music. They ceased the instant the performers ceased to play, and then retired to the places from which they had advanced. During this time the others remained standing in the same order as at first; there were no signs of restlessness, and many even seemed to regard the dancers with attention and pleasure, whilst only a few retained that vacant expression peculiar to their class. There were, however, no moanings or gesticulations, but each stood by his neighbour, forming three lines at the end and sides of the room.

After the completion of this dance, the whole of the boys were desired to sing one of the songs which had been composed for them. It was a very simple air—such as those sung by the classes of Hullah in our own country—and the words were well suited to their feeble comprehension. During this performance they were led by two assistants, who rendered important aid by singing with them, beating time, and encouraging them in a lively and spirited manner. A copy of the song was handed to me, so that I had an opportunity of noticing how far this congregation of idiots were capable of exercising the faculty of enunciation. The words were as distinctly, if not more distinctly, pronounced than we usually find to be the case with us by singers, and it was truly gratifying to follow them, line by line, through this beautiful little melody. It was sung with full force, but not over-loud; the time was well-kept; the pauses between each verse distinct; and, as far as I could judge, the tune appeared correct. In short, the whole piece was executed in a style quite equal, if not superior, to what we are in the habit of observing in the junior singing classes of Great Britain.

It may readily be conceived that the novel spectacle of so many unfortunate and hitherto-considered incapable creatures harmoniously engaged in the execution of this simple but touching piece of music, was calculated to produce a new and lasting impression; and I shall not easily forget the sensations which I experienced at the time when listening to the performance of it. Although apparently an unmoved spectator, yet that strange mixture of feeling arising from sympathy with affliction, and rejoicing at its relief, was powerfully excited within me. Every faculty of attention seemed roused into action; and I felt the full importance of devoting the little time permitted me to observe, with the strictest accuracy, the demonstration about to be made.

In a little while one of the youths, with a drum slung across his shoulders, advanced to the middle of the room, and placed himself in an attitude of readiness to take part in the next exercise. This consisted of a martial air, sung by the boys, and accompanied at intervals by beat of drum. The drummer had every characteristic of a congenital idiot in a marked degree; and although he possessed only that imperfect power over his fingers which rendered a secure hold of the drumsticks difficult,

yet he executed his part with marvellous accuracy, and evidently with no small enjoyment to himself. It was interesting to observe the pleasure he manifested during, and immediately after, the short and occasional beats which constituted his part of the performance; and it was still more interesting to reflect on the consciousness he had, by education, been made to feel, so as to be able to appreciate the singing of the others, and understand the precise instant when his part required to be executed.

The next musical lesson showed that instruction in this department can be carried to a much higher degree of perfection than we could have supposed possible. The youths were arranged in three groups, each group taking a part of music different from the others, and each led by an assistant. One or two songs were surprisingly well performed, the respective sections singing different notes from the others, but all preserving the utmost harmony and exactness of execution.

A large black board, on which were chalked, in large characters, a gamut, and the notes of an air, was now brought into the room, and placed in a conspicuous situation, so that each pupil could readily stand before it. Arranged in this manner, the youths were desired first to read the several notes; this they did by pronouncing simultaneously, and with great distinctness, as the stick of the tutor was pointed to the notes, *la, sol, fa, &c.* After thus reading the music in the natural voice, they were requested to give to each note its musical tone. Accordingly, as the wand was pointed to each note, they sang it. This exercise began by first passing regularly up and down the gamut, and then they were led from one note to another indiscriminately, showing a power of memory, and immediate application of it, which I was little prepared to expect. They then sang the air, the notes of which were chalked on the board. This, though more pleasing to the listener, did not, however, show an amount of mental capability equal to that evinced by the sudden and unexpected transition from one note to another in the previous exercise.

During the latter performance I advanced forward amongst them, so as to be able to observe more accurately how far each youth took his portion, or whether some remained silent or not. This unfortunate step on my part disturbed their attention, and some irregularity as well as discord was the consequence, but only for a short time. Aware that my presence amongst them had unintentionally formed a cause of disturbance, I became sensible of my error, and was made conscious how slight a cause is sufficient to destroy the order and precision which has been created in these feeble and imperfect minds.

This completed the musical exercises, which were gone through in a manner that would have done credit to any juvenile class of singers enjoying the full use of all their faculties. The songs were sung with much clearness and great power. Indeed such was the force of sound produced, that whenever any of the musicians took up their violins by way of an occasional accompaniment, the instrumental music was completely drowned by that of the united voices. The general effect was remarkably good, and such as would have met the approval of any person ignorant that the performers were composed of a class of imbeciles. The effect of music, at all times grateful, was in this instance exalted in a high degree by the contemplation that it formed a powerful means of exciting faculties which otherwise might for ever have remained dormant. Its influence was manifest among this assemblage of persons, formerly supposed to be incapable of any amount of execution, still less of any capability of appreciating it. It was evident, however, that not only did each join with full spirit in the general chorus, but also that an exhilarating effect was produced throughout the whole body, well calculated to quicken the feeble and scanty germs of intellectual power bestowed on these forlorn creatures. Apart from this higher consideration, the evident delight they all manifested when engaged in singing their songs, was of itself very pleasing to witness; and I could not avoid thinking, that if it were to serve no other purpose than that of

illuminating, by a momentary consciousness of happiness, an existence otherwise dark, blank, and joyless, it would be desirable to institute such exercises.

In a future article will be given a description of the various methods adopted to communicate to the pupils a knowledge of things and signs, of reading, writing, and calculating, as well as the mode of instruction pursued to enable them to follow various mechanical employments.

R A G S.

THERE is lying in the kennel before the windows an object without determinate form or colour, yet giving the idea that it once belonged to the wardrobe—perhaps the under-clothing—of a human being. It bears the permanent stains of antiquity, only half visible through those of accident; and is infinitely ragged, not so much from violence, as from gradual decay. It is an object which a beggar would scorn to pick up; and indeed which a beggar, we have little doubt, has cast away. Yet will it serve us, who are less nice, for a text. In our eyes it is surrounded by a thousand proud and beautiful, as well as abject and melancholy, associations; and we pray the reader's forbearance for a few minutes while we vindicate the dignity of rags.

This rag has a history. It has a past as well as a present; and notwithstanding appearances, it is destined for a glorious future. It is in all probability (supposing it to be linen) of foreign origin; and in its condition of flax, once waved, perhaps, in the fields of Marienburg. But on this we shall not insist; for it might likewise be claimed by the whole of the Baltic provinces, and also by Belgium and Holland. Nay, it is not impossible, after all, that it may be a native of our own country; although here the cultivation of corn has almost entirely superseded that of flax.

However this may be, the flax in question received the fabric of linen possibly in the north of Ireland—more probably in Dundee; and was thence transferred to the weary fingers of those needlewomen, the inadequacy of whose wages (caused by the superabundance of labour in a kind of industry in which *all* women are proficient) has latterly awakened so much generous sympathy and thoughtless indignation. It is now worn by the fair and the wealthy, adding a lily-like freshness even to beauty itself. Perhaps it receives in its folds the wearied limbs that have just returned from floating through their first ball. Perhaps, after a time, it becomes the perquisite of the lady's-maid. This is an unfortunate vicissitude; for the lady's-maid, on losing her situation (supposing it to be in London), has recourse to the pawnbroker for a loan, and gives it as a hostage. Once in his hands, it is always sure to get back into them again and again, till on some occasion the time fixed by law elapses, and it is sold at a public auction of unredeemed pledges. The purchaser is the 'sale-shop' man, who exhibits it in his warehouse of miscellaneous bargains; where, after a time, it attracts the attention of an economical cook, who thinks that, with plenty of bleaching and a little darning, it may do very well till her next wages are due. After wearing and washing it almost to tatters, the cook presents it, in a fit of proud generosity, to the scullion; and she, when she finds it impossible to make it hold longer together, bestows it in charity. It is now never washed; its constitution is gone; its fabric moulders away; and at length the beggar-woman, in a rage, tears off a rotting dangling fragment from her dress and flings it into the kennel. This is the rag on which we are now lecturing.

To what base uses hath it come at last! Who would think that there is still restoration for it in its present disgrace—falling in tatters from a beggar's back, and flung into the kennel? Who would dream that it was still destined to return into the hands of its first mistress—that she would receive it with smiles of welcoming—make it the dearest companion of her solitude—press it, perhaps, to her lips and bosom, and cover it with kisses and tears? Yet this is the history of a sheet of writing-paper—of a metamorphosis as wild as Ovid ever imagined. Nor is this allusion to letters made solely for the purpose of rendering the contrast more striking; for it is this kind of paper we manufacture from our own rags, while we send abroad for the materials of our printing paper.

The rag before us will probably owe its preservation to an old woman who may be seen prowling about mysteriously in the morning and evening twilight, and stuffing such matters into her apron, gathered round her waist. In Scotland, the old woman is usually provided with a creel; but neither she nor her English sister has much of a business-like air. They seem to be half ashamed of their employment, and give you the idea of persons reduced by distress to some temporary shift. In France, on the contrary, the chiffonier is proud of his profession. He is not unfrequently a young able-bodied man; and we have known some of them dandies of considerable pretensions, dressed habitually in clean white trousers. Some years ago—for we have long been partial to rags—we printed elsewhere the following notice of the Parisian chiffonier and his trade:—

'The chiffonier has a basket strapped to his shoulders, and a sharp-pointed stick in his hands, with which he dexterously picks up his rags, and throws them with a jerk behind his head. He has a fancy, too, for old bones, old bits of iron, pieces of dirty paper, and broken glass. Neither will he pass without some notice even a franc piece, if it should lie in his way. Some of these professors are well off; but in general they are supposed to make at the most only eighteenpence a-day. Still, this sum is produced, as it were, from nothing. One would have thought it an easier matter to make gold out of lead, than silver out of old rags! It may be said that a person who receives eighteenpence for running errands, makes his money also from nothing. But the runner does no good to trade. His service produces nothing but the transference of coin, and leaves no result that is felt in the business of the country. The labour of the chiffonier, on the contrary, *creates* capital out of refuse. The four thousand chiffoniers of Paris collect 1200 francs' worth of rags in a day, which, on passing into the hands of the wholesale people, whose employment it is to have them sorted and washed, give a living to five hundred persons, and become worth 2400 francs. About the same quantity of rags is obtained from the hospitals and other quarters; and thus the city of Paris, out of mere rubbish and refuse, produces a daily value of 4800 francs, or 1,752,000 francs in a year. The yearly amount for the whole kingdom of this singular trade is 7,480,000 francs; affording a living at the rate of 500 francs (or twenty pounds) to 14,960 persons.' It would not be easy to ascertain correctly the statistics of the rag-collection in England, for with us it is not a distinct profession. In London the greater part of the gatherings are obtained by the rag shops, distinguished by the sign of a black doll dressed in a white frock; and thither servants and others resort with fragments of all sorts. Even economical families of the lower middle rank save their rags for this traffic,

receiving for them a price which varies with the supply; but may be quoted as averaging twopence a-pound. These shops derive much assistance from the peddling merchants who go about from door to door, dealing chiefly by barter. They exchange glass and earthenware, and in other instances combs, mock jewellery, and other small wares, for rags and refuse of all kinds, such as dripping, &c. The Quakers are the most resolute boarders of all such matters, although they probably dispose of them in another way; and we have frequently been reproved by these benevolent economists for throwing into the fire a fragment of string or paper, with the warning that we were wantonly destroying the food of the poor.

Much might be said upon the appearance of the rags of the various countries, and many curious analogies might be traced; but, economically, the only difference is, that those from the northern ports are stronger and darker than those from the south. At one time, it was important to the paper-maker that the rags should have as little dye in them as possible; but the powers of chemistry render this no longer of consequence. With certain bleaching powders, the paper-maker will deterge the darkest tint, whether natural or artificial. The rags, therefore, which now command the highest price in the market are those of stout linen materials, of whatever hue; an old sack in this respect being preferable to the finest cambric shirt. The United Kingdom being altogether incapable of supplying the vast and increasing demand for rags of a superior kind, a large import takes place from Hamburg and other ports in northern Europe; thither bales of rags centre from all parts of the interior for exportation; so that, in point of fact, the bulk of our paper is composed of the cast-off apparel of the German peasantry—continental chemises, bodices, blouses, and other articles, transformed, under the magical hands of our paper-makers, into a fabric of surpassing strength and beauty. Great, however, as is this rag trade, it falls very far short of what is required by the exigencies of literature; and England, if permitted, would sweep to itself every rag in Europe. Like the magician in *Aladdin*, we go about offering our new wares for the old, filthy, wonderful lamp, which has the property, when in skilful hands, of enlightening the darkest corners of the earth! But some there be who will not listen to our charming, charm we never so wisely. Of such are the Dutch, Belgians, French, Spaniards, and Portuguese, who, in prohibiting the export of their rags, of course inflict an injury on those amongst them who would gladly exchange their disused garments for the well-told money of Old England.

Deprived of such means of recruitment, our paper-makers have been driven to their wits' end to find materials for their manufacture. Assisted by the deterring processes to which we have adverted, they now gather together and use substances which were formerly either thrown away as worthless refuse, or used as manure. Thus the sweepings of cotton and flax-mills, thick as they are with grease and dirt, have become materials for paper; and this circumstance, trifling as it appears, has given that wonderful Manchester another great manufacture. Old ropes, damaged flax—anything, in short, however foul, can now be purified and bleached as white as snow; and instead of throwing the materials in a heap, as formerly, to undergo a process of decay, they are merely cleared of the dust by one machine, and then torn into millions of shreds by another, before being subjected to the chemical treatment.

Woollen rags are chiefly used as manure, especially in the cultivation of hops; but some are mixed with new wool, and rewoven into cloth. The fabric, of course, is not the stronger for this intermixture, but it looks very well; and many a man who shudders at the idea of a coat from Holywell Street or Rag Fair, arrays himself with complacency in the worn-out covering of a German peasant. The same material is also used in some sorts of thick, but not tenacious, packing-paper, in felt, and in gun-wadding, and by the poorer classes

as a substitute for feathers—if we should not rather say chaff—in their beds.

Paper made from cotton is said to have been known in Greece so early as the ninth century, although the Egyptian papyrus continued to be used, together with parchment, long after. Macpherson, in his *Annals of Commerce*, mentions a specimen of linen-rag paper in the year 1243, but others date the invention from the beginning of the fourteenth century. England, however, was much behind in the art. The first paper-mill was established at Dartford by a German, jeweller to Queen Elizabeth, in 1588. During the seventeenth century, England was indebted to France for the greater part of her supplies, and her first important efforts originated in Frenchmen chased from their country by the madness of Louis XIV. in 1685. The manufacture now began to improve in England; and in 1690 that of white paper, hitherto almost untried, was added. During the last century considerable progress was made; but in 1800, when we were in the very thickest of the twenty years' war, the scarcity of paper was so great, that the expedient was first resorted to of discharging the ink from what had been used, and remanufacturing it. This is effected, in the case of printed paper, by subjecting the pulp to a caustic ley of lime and potash, while the written paper is treated in the same way with oil of vitriol. Thus we see there is no end to the future of the wretched rag on which we are lecturing!

For a long period paper-mills were conducted on a meagre scale; the sheets of paper being made singly by a manual operation with a sieve. Fourdrinier's splendid invention of the paper-making machine has almost entirely superseded this ancient process, and now a single mill will turn out more paper in a week than one of the old concerns could manufacture in a year. Thanks to Fourdrinier for his skilful adaptations; for to his machinery are the public in a great measure indebted for the vast supply of cheap and popular literature they now enjoy. So expert have English and Scotch papermakers become in the use of rags, that Great Britain is no longer indebted to her neighbours for paper, unless it be for some French hangings, which she still occasionally imports at the demand of fashion.

We have described the fortunes of cotton, linen, and woollen rags, and it now only remains to say a few words touching silk. The fragments of this costly fabric, one might suppose, would be more valuable than those of commoner clothes; but the reverse is the case. Neither the peddling barterers, nor the black dolls of London, will look at your silk rags; even the gentleman who comes round with his donkey-cart, and traffics liberally with your servants for bones, bits of metal of any kind, broken glass, &c. turns away from them with contempt. He will buy your old bones by the pound or the bushel, and give you a good round price for them (perhaps as much as a penny a-pound), but he will not have the fragments of your once best dress even as a gift.

The unhappy position of silk rags we look upon as something very extraordinary, considering the value of the raw material on the one hand, and the progress of chemical and mechanical science on the other. We know that the Phœnician women unravelled the Chinese silks, and multiplied them into fabrics of such loose texture as gave great scope to the satirists. No attempt, however, has been made in England, so far as we know, to revive this species of industry; although we have recently heard of a French projector who has conceived the idea of *dissolving* the silk into its original glutinous substance, and spinning it silkworm-fashion anew. This seems feasible enough; but by unravelling existing rags, one would think that at least some coarse but compact fabric might be produced which would be found useful in articles less dependant upon elegance than a lady's gown.

We have only one word to add, and it is on the scandalous impolicy of taxing the manufacture of rags on their transformation into paper. At present, the excise

duty is three-halfpence per pound weight on the manufactured article—a rate almost equal to cent. per cent. on the cost of the raw material. It is to be trusted that the press will not long maintain its unaccountable indifference on this subject.

NATURE AT WAR.

To him who is accustomed to contemplate nature as a great scene, in which nothing but universal peace and harmony prevail, it will be a startling assertion to make, that all nature is at war. It is, however, not the less true. Throughout all animated nature, from man himself down to the meanest animalcule sporting in its ocean of a drop of water, there runs a system of reciprocal defensive and offensive warfare—the stronger against the weaker, the greater against the less. Nor are we to regard the vegetable kingdom itself, ordinarily looked upon as so passive and inoffensive, as an exception to this rule: the stronger and more luxuriant weed is more than a match for the delicately appetised flower, and it will eventually, though by a power of a negative character, succeed in expelling its gentler rival from the field. But, as a general rule, it is right to consider the vegetable world as 'more sinned against than sinning;' and we consequently find that the powers with which it has been endowed are chiefly of the defensive kind. Still let me not be misunderstood. It is not that I would intimate that a real harmony does not characterise the operations of the Divine creative intelligence; for such a harmony, as wonderful as it is great, really exists, and is, in fact, the wise and beneficial result of this very circumstance—the war of nature. From the scenes of confusion, anarchy, and mutual destruction, appearing such when separately regarded, springs that beautiful correlation of organised beings known to the natural philosopher as the equilibrium of species, or the balance of creation. It is my purpose, on the present and upon a future occasion, to enter into some consideration of the elements of this warfare, defensive and offensive. Some of those striking evidences of a foregoing design, which find their wide development in creation at large, are to be found in rich abundance in the discussion of this interesting subject, and reveal to us, at every step, a fresh demonstration of the stupendous attributes of that creative Wisdom which, while it produces a universe, can stoop to organise a humble insect, or to endow with form and functions a still more insignificant animalcule.

If, in our first excursions into a foreign country, we were to see the inhabitants going about carrying pistols in their belts, and swords in their hands, or covered with some impenetrable armour, we should make the very natural conjecture that an intestinal warfare must be going on. The weapons of offence and defence imply an enemy and a warfare in themselves. When, therefore, we discover among the inhabitants of the animal kingdom an infinity of apparatus expressly contrived for attack and defence, we are led to draw a similar conclusion. Thus, from a brief review of the defences with which the Creator has supplied his creatures, we shall collect the fact, that there is a civil war going on through all grades of the animated and organised worlds. These defences are of many kinds. Such as will admit of classification will be treated of first, and afterwards those of a miscellaneous nature. It will also be convenient to consider the defensive provisions of the vegetable world, though briefly, as distinct from those of the animal, although in their general nature they are closely assimilated.

To commence. *Imitativeness* is one of the most curious and interesting of these means of defence against an

enemy; while it is one which in some cases exhibits in a singular light the mental faculties, if the expression can be allowed, of the creatures to whom it has been given. Imitativeness is a safeguard whose utility depends upon a creature passing for what it is not, and being thus overlooked by its foes. Imitativeness is either passive or active. Either the colour, form, or aspect of the creature resembles some other natural object, or, by an effort of its own, it is able closely to imitate the object for which it wishes, so to speak, to be mistaken. Among insects we meet with many instances of *passive* Imitativeness: some of the spectre tribe, or *Phasma*, exactly resemble small branches of trees, aping them in their appearance even to the very sprays, knots, and unevennesses on their surface. Others appear like dried leaves—brown, arid, and lifeless; while others have delicate frames of lace-like texture, so closely approximating to the aspect of leaves whose parenchyma has been removed (such as we find in ponds after they have undergone a long maceration), as to render it a matter of difficulty to decide upon their real nature until the creatures are seen in motion. The *Bombyx quercifolia*, and some of the *Lepidoptera*, come under this classification. When these creatures are seen on trees hanging down like withered leaves, none but an entomologist would dream of their being anything else. M. Lefevre mentions an insect he met with in the desert, which was of a perfectly identical colour with the brown sand; while a little farther on, where the soil was white, the insect assumed a silvery white appearance. Insects also often resemble pebbles, stones, gravel, &c. and can hardly be distinguished from them, when resting among such objects, even by a very sharp scrutiny. Many too, such as the little green and yellowish insects which infest our flowers, especially rose-trees, are of a colour so precisely that of the green leaves or branches they are devouring, as in many cases to escape detection. When these tiny creatures change their abode, their colour generally changes to a corresponding colour. Some resemble the mosses, bark, and even the flowers of trees and shrubs upon which they are found; and so nearly, that a leaf upon which one is resting may be taken into the hand, and yet the insect remain unperceived. Some which prey upon the ova, or produce of other insects, are so nearly like their victims in appearance, as even to be permitted to enter the nest, and accomplish their predatory objects, without discovery; they are little 'wolves in sheep's clothing.' It is stated that bees, who have generally something to afford, are frequently subject to this species of deception.

We find also among the finny tribes the evidences of a similar provision. Those fish which swim low in the water have their backs coloured to correspond with a deep-sea hue; while those which, like the mackerel, swim near the surface, have their bellies of a lustrous white, so as to be less distinguishable, by enemies swimming beneath them, from the bright sky above. Indeed the general difference in colour of the back and belly of fish seems a provision against enemies from above and below. Those fish which live among weeds, have the colour of the weed as their prevailing tint; while those which live at the bottom, such as soles, flat-fish, &c. resemble the sand or mud. Some fish, as well as frogs, change their colour with that of the mud and weeds of the waters they inhabit.

Birds, upon whose strength and swiftness of pinion depends their greatest security, are able likewise to avoid their winged enemies by the strict correspondence of their plumage in colour with that of the brown fields, or the withered branches and leaves, upon which they repose. Who, in the boyish pursuit after the tiny wren, has not half

conceived her to possess the power of invisibility, as she has ran along the seared stump or mossy bank before his feet! The hawk thus often loses his prey, and wheels off in sullen disappointment, while the lark he has been pursuing is all the time only crouching down among some kindred coloured herbage. The small birds, when under pursuit, seem to be quite sensible of the value of this defence, and seek out those spots of ground, or patches of vegetation, which bear the nearest resemblance to their own colour. Darwin tells us that birds which are much among flowers, such as the goldfinch, are furnished with very vivid colours themselves. The partridge, the woodcock, the tree-pigeons of the East, and the quail, and even the tiny tom-tit, are deeply indebted to this provision of colour for their defence.

Among animals too, although in a less remarkable manner, passive imitiveness is a means of defence. The changeable appearance of that animal Proteus, the chameleon, is a striking instance in point. The *trapelus*, the *polychrus*, and several of the *anolis*, possess the same wonderful property; some of them can change their colour even more suddenly than the chameleon itself. The reader must be familiar with the explanation of this phenomenon; which consists in the sudden inflation of the enormous lungs of these creatures, rendering them almost transparent. The hare, as she sits in her form, can only with great difficulty be distinguished, by the unpractised eye, from the herbage around her; and were it not for eyes and noses more acute than those of men, she would often escape by this means. It appears not improbable that the change of colour in the animals of northern regions in winter, is an additional provision against their enemies.

Active Imitativeness is one of the most curious subjects in natural history. To only a limited number of the members of the zoological scale has it been given to play the mimic in the great game of life and death. Commencing with insects again, which are mimics in a wonderful degree, the first stratagem we meet with is the *mock death*. Many insects, on being touched, instantly curl themselves up, and drop into a seemingly lifeless condition, out of which nothing but the pressure of urgent danger can arouse them, and then, like some human malingersers we have read of, they speedily find their limbs, and run for their lives. There is a beetle called the *Anobium persinar*, commemorated by writers on entomology, whose astonishing endurance in this deathlike condition scarcely finds a parallel in the marble rigidity of the tortured Indian. This little Spartan may be pricked with needles, roasted over a slow flame, maimed, wounded, and even torn limb from limb, without evincing a single symptom of sensation or of life; but in its own time, if indeed it has not been too seriously injured, it will come to life again, and coolly walk away as if nothing had happened. The spider is known to every one to perform this feat of simulation. Some insects will, when assaulted, turn on their backs, and stretch out their little limbs in all the immobility of death itself; and after shamming until the danger is over, they will resume their briskness again. This device seems directed against that sentiment in the breast of their enemies which prevents their attacking anything from which life has departed. Other insects will lie on the branches of trees, and arrange themselves in such stiff, inanimate postures, as to cause them frequently to be mistaken for the branches or twigs themselves. An anecdote is told of a gardener who, seeing, as he thought, a dry twig on a tree, broke it off, and to his surprise found it to be a caterpillar. Another is related of a servant who, finding, as she thought, little round beads in the garden, began to string them into a rosary, when she found them to be animated creatures. The puss-moth, hawk-moth, and others, are caterpillars of the appearance of withered leaves and twigs. Among birds, the pee-witt or plover is familiarly known to imitate lameness. It will turn over and over, limping and hobbling, and uttering its peculiar plaintive cry, until it has drawn the intruder to a distance from its nest, when it takes wing, and leaves him baffled and disappointed. Its eggs, too, have a brown colour, which makes their

discovery among the dry grass which surround them more difficult. The partridge also, to lure away an enemy, will run just as if it was wounded. Some of the feline tribe, and others among animals, will simulate sleep, until their hapless prey has been drawn near enough to be pounced upon. Singular to relate, there is a crab, the *Cancer phalangium*, which cuts off small pieces of a marine fucus, and fastening them upon its spines, marches upon its enemies, like Birnam wood to Dunsinane.

Armour must be considered as the next and most obvious defence, and may be regarded, as in the former instance, both as passive and active: passive where, like a coat of mail, it is a negative defence, and active when it consists of weapons used by the voluntary efforts of the animal. The insects are frequently provided with an armour of hairs, some of which, on being touched, will produce violent pain and inflammation of the hands; and others are protected by a covering of mail. Many beetles may be trodden upon by the human foot without injury: ants and others often escape death even after being apparently crushed beneath the weight of man. The forest-fly, or *Hippoboscæ equina*, is well known to be killed with the utmost difficulty by the pressure of the finger and thumb. The cocoon of the silk-worm is a beautiful illustration of this kind of safeguard. The larva is here protected by its silken envelope from many of the dangers that would otherwise be fatal to it. The 'frog-spittle,' as it is vulgarly called, so often seen on our bushes, contains and protects the larva of a little insect, by its very disagreeableness, from the attacks of wasps and birds, &c. Others are covered, or cover themselves, with a kind of cottony or feathery armour. Some roll themselves up; and their projecting hairs make it a matter of difficulty to take hold of them. Among the inhabitants of the waters we immediately encounter the crustaceous animals, which are protected by a calcareous coating outside; the familiar examples are the sea-urchin, the crab, the lobster, crayfish, &c. Shells are a defence common to land and marine creatures, and are in some cases so strong, as to render them almost impregnable. The scales of fish, as of the carp, are also of service as a defence. The solid armour of the genus *Testudo*, the tortoise tribe, are good illustrations. Among these the bosc-tortoise is wonderfully provided; for it possesses a shell articulated by two lids, so that when the head and limbs of the animal are withdrawn, it is completely encased in it, and can bid defiance to its enemies. The armadillo has received its name from the paving-stone-like armour which protects it. The term *Pachydermata*, or thick-skinned animals, is applied to those whose tegument is so thickened as to form a very effectual defence. The skin is sometimes so plated, as in the hide of the rhinoceros, as to resemble the roof of a house; while among snakes there is a remarkable illustration of mail-like armour. The scaly ant-eaters, again, are provided with large scales like tiles, which, on being attacked, they can elevate, and then roll themselves into a ball. The hedgehog curls up the vital parts, bending himself into a round prickly ball, which has not one weak part exposed. The dense coat of hair is in other animals a defence not to be despised; that of the shaggy bear is used on our soldiers' caps as a shelter from the blows of the sword. The feathers of birds are in some instances of a similar value. Many of the alligator family have skins so studded and carbuncled with warty excrescences, as to give them the appearance of those doors which are covered with iron nails. Helmets and bony shields are not uncommon among fish.

Active armour is, however, a more general provision, being possessed by an infinite number of the members of the animal world. Among insects it is the great leveller of the enormously disproportionate power between their enemies and themselves; rendering some of the least of such apparently insignificant creatures objects of terror, suffering, and aversion both to man and to the brute creation. The sting of the mosquito tribe, that scourge of hot and cold countries alike, is a well-known instance. The venom of the scorpion is frequently so powerful, as to prove fatal, or to require the amputation of the bitten

limb. Some of the black ants sting so keenly, that the part feels as if cauterised; and there is an ant called the 'Ant of Visitation,' before which the inhabitants will even rise in the middle of the night and fly. The celebrated *tarentula* spider, about which so many fables have been circulated, gives a very sharp and venomous bite; but its effects soon disappear. Many of the centipedes bite in a similar way. The stag-beetle is another ferocious insect, terrible from the power of the great forceps it carries, like antlers, on its head. The common ear-wig carries a similar weapon at his tail. Some of the large South American spiders are so powerful and venomous, as to be able to destroy humming-birds, pigeons, &c. The burning sand-fly occasions a wound so minute as to be almost imperceptible, as if the flesh were burned with a red-hot needle. There is a small wood-spider called the *tenderman*, whose bite is usually fatal. Among fish are those terrific instruments the teeth of the shark; the spike of the xiphias or sword-fish, a weapon so powerful, as to be frequently driven violently through the bottom of a ship's boat; and many more. The saw-fish has a powerful serrated snout, with which it attacks, and frequently successfully, the largest whales. There is a roundish species of fish, known as the *diodon*, which looks like an aquatic porcupine. Cuvier compares it to the burr of a chestnut, it is so thickly covered with sharp-pointed spines, which it is able to erect at its will. Others are armed with sharp instruments upon their fins and tails, which are directed in different ways to suit the habits and motion of the fish. Some of the *Scorpena* tribe are so hideous with these fearful weapons, as to present an aspect perfectly frightful; and some possess poisonous instruments as well. The flying-fish has a long, stout spine, which forms a powerful weapon. A fish called the *monocentris* is wonderfully defended by being completely mailed with rough angular scales, besides having five or six immense spines disposed on different parts of its body. The reader scarcely requires to be reminded of the little stickle-back, whose sharp dorsal spines must often have pierced his hands. Some foreign members of the same family, in addition to these spiny ornaments, have likewise a bony hauberk. There is a fish vulgarly known as the *surgeon*, found in the Indian Ocean, which carries a strong movable spine on each side of its tail, as sharp as a lancet, and inflicts severe wounds on those who carelessly handle it. There is a curious fish with green bones, called the *belone*, which has a bite considered highly dangerous; and some of the genus *Silurus* possess a spine above the shoulder, which they can raise or depress at will, the wounds of which are often followed by tetanus. It is only necessary just to mention, to avoid incompleteness, the fangs of serpents, with the consequences of their bites; and the vast claws, sharp snouts, tusks, and horn-like processes of some of the *Carnaria*, are also weapons which will occur to the recollection of every one. The tail of serpents and apes, and particularly of the *Marsupialia*, is a weapon occasionally of considerable efficacy. The hoof and horns of the horse and buffalo may be also enumerated. The jaws of the lion, tiger, &c. are terrible instruments too: of the hyena it is mentioned that so great is the muscular force with which it fastens upon anything, that it is impossible to separate it from its object; the Arabs, on this account, give it name as a synonyme for obstinacy. It is a remarkable circumstance, that some of the *Orycteropi*, or ant-eaters, have a spur on their hind-feet, perforated by a canal, which leads to a gland secreting a liquid, and placed in the inner part of the thigh; the wounds of this instrument, which is almost an anomaly in itself, are said to be highly dangerous. Among birds, the talons and the beak form the chief offensive instruments. The courageous little shrike, and a bird called the American tyrant, use the beak alone, and with success, against the attacks of the largest birds. Many birds have hooked bills; the albatross, or man-of-war bird, eagles, and vultures, possess this powerful addition. Finally may be mentioned the claws or forceps of the *Crustaceans*—the crab and lobster. These are appendages of vast power, and are used with effect both as a defence and as a

means for crushing the shells of the smaller creatures upon which they prey. It is even reported that some of the large species have been known to seize a goat, and drag it into the water, drowning and devouring it.

AMERICAN INDIAN SKETCHES.

In the vain hope of awakening the conscience of the United States government to a proper sense of the duty it owes to the unfortunate aborigines who still exist within its territories, the pen has been taken up by a zealous and well-known friend of the Indians, Thomas L. M'Kenney, late chief of the bureau of Indian affairs at Washington.* We have perused this benevolent gentleman's narrative with considerable interest, and cannot but lament with him that year after year the native tribes are lessening in number, less from their own intestine feuds, than from the dishonest appropriation of their lands, and the vices introduced among them by the whites. Alive to the disgrace of this national crime, a number of respectable citizens in New York, in 1829, attempted to move the government on the subject; but private interests were too powerful to be overcome, and nothing was eventually done to improve the condition of the sufferers. For the last sixteen years a systematic course has been persevered in of banishing the remains of the Indian tribes to wildernesses beyond the avowed limits of the States—to be again, doubtless, molested in these new hunting-grounds, when it suits the purpose of the white man to make further encroachments.

Referring principally to official proceedings, Mr M'Kenney's work does not admit of analysis, and nothing of the kind need be attempted by us. The author, however, occasionally relates an anecdote illustrative of his Indian experiences, and one or two of these we shall pick out for the amusement of our readers. The first refers to an expedition in which he was concerned, along with General Cass, in 1837, with the view of settling a treaty with several collected tribes at a place called Butte de Morts (Hillock of the Dead).

'The business of the treaty over, everything was in motion, preparing for the departure of all to their respective destinations. At one place might be seen a group of squaws, and children, and dogs, all seeming to be engaged in huddling together, or hauling to the water's edge their provisions and effects; whilst others had their canoes in the water, and others again were in the act of gliding away upon the smooth surface of the river, enjoying the quiet satisfaction which the presence of rations and good fare are so well calculated to produce.

'At this moment of general activity, a scream, wild and fearful, was uttered. It was by a female. A rush of a thousand Indians was made for the spot whence it proceeded. I looked, and saw in the midst of the crowd a man's arm raised, with a knife in the hand. It fell—and then was heard another scream! When I sprang towards the scene of what seemed to be a strife of blood, and just as I had reached it, Major F., having started from an opposite direction, was a few feet in advance of me; and at the instant when the third blow was about to fall upon the victim, he struck and knocked down the man who was thus desperately employing the bloody weapon. There stood, trembling and bleeding, a fine-looking squaw. She was mother of the wife of the man who had made the attempt upon her life. The deltoid muscle of each arm, just below

* Memoirs, Official and Personal; with Sketches of Travels among the Northern and Southern Indians. By Thomas L. M'Kenney. New York: Paine and Burgess. 1846.

the shoulder, was cut with deep gashes. These were given, as each arm was raised, in succession, to shield her body from the impending knife. The first thrust had thus disabled one arm, the second the other; and if the third had been given, there being no shield in the arms for further protection (for they both hung powerless by her side), it would doubtless have gone, where the two first were aimed, to the heart!

I took charge of the trembling and agitated woman, giving orders to the soldiers to take the offender, and lock him up in our provision-house, until some suitable punishment should be agreed upon for a crime so flagrant and bloody. Our surgeons having gone to the village, I cleansed and bound up the wounds; and by the employment of bandages, kept the arms stationary, giving her directions not to use them, and sent her in charge of her daughter and some friends to Green Bay, to our surgeon, to be attended to.

The cause of the outrage was as follows:—This woman and her daughter had carefully put away their supplies, &c. in their canoe, and were on the eve of embarking, when it was rumoured among the Indians that a whisky-dealer had arrived in the woods, behind our treaty-ground. The moment it reached the ears of this reckless Indian, he started with others in quest of the whisky. The mother-in-law, well knowing that their calicoes, and blankets, and strouding, and pork, and beef, and flour, &c. would soon be parted with, in exchange for this fire-water, followed him, intreating him not to go, but to go home and enjoy what had been given them there. She clung to him rather inconveniently, when he resolved on freeing himself by the use of his knife. For some time she kept off his blows with her paddle; but this being presently knocked from her hand, she had no shield left but her arms, and these were alternately disabled in the manner I have stated.

Governor Cass coming along, I narrated all this, and to the inquiry, "What shall we do with this man?" answered promptly, "Make a woman of him." And so we did. The process was on this wise. The several interpreters were sent out to summon in the Indians, and to arrange them around the *Butte de Morts*—the women and children in front. This being done—from eight hundred to a thousand perhaps being thus assembled—the offender was brought from his confinement, and led by a couple of our voyagers to the top of the mound, and placed against the flag-staff; Governor Cass and myself, and the interpreters, being there also. Never before had I witnessed in Indians a feeling so intense. Every eye of chief, half-chief, brave, and squaw, ay, and of every child, and it seemed to me of every dog also, was beaming with concentrated lustre, and every eye was upon us. They had all heard of the assault upon the woman, but to a man justified it, alleging that a woman was nobody, when the power and freedom of the man were attempted to be interfered with; and that the life of any woman would be no more than a just forfeit for such intermeddling.

The squaws entertained different notions, and were deeply interested, personally, in the scene before them—not one of them knowing anything further than that some punishment was to be inflicted on the man for his conduct. The offender stood unmoved. Not a particle of interest did he seem to take in what was to befall him. If he had been there alone, listening to the rustling leaves, and the moaning of the winds, and looking upon the woods, the sky, the river, and the lake, he could not have been more unmoved. He was dressed in his best. Moccasins, ornamented, were on his feet; his leggins were of scarlet cloth, fringed and decorated, besides, with bits of fur, foxes' tails, and rattles. A good blanket was about his waist; his ears were ornamented with silver rings, his arms with bracelets, his face with paint, and his hair sprinkled with vermilion.

Attention being called through the various interpreters, the governor spoke, explaining the case—the innocence and kind designs of the woman—the propriety and usefulness of the interference, which was not rudely attempted—the noble object of keeping her daughter's husband from joining in drunken revelries, and being bereft of all their stores, and then going home poor, and naked, and hungry. That was her object; whilst the whisky-trader cared for none of these things, but sought only to rob them of their blankets and calicoes, &c. and give them nothing in exchange for them but fire-water. The Great Spirit looked down and smiled on this act of the woman, and was angry at the bad conduct of the man, and with the whisky-trader. It was for an attempt so kind and so proper on her part that this man, the husband of her daughter, had seized her, and with his knife struck at her heart, to kill her, and but for her arms, with which she had shielded her breast, she would have been murdered. Her cries, and tears, and blood, were all unavailing; nothing could have saved her but the timely arrival of help, and a blow that put it out of his power to consummate his bloody purpose. For this act he shall be no longer a brave; he has forfeited his character as a man; from henceforth let him be a woman!

At this annunciation, the chiefs and braves muttered vengeance. We were told by the interpreters they would resist us. But never before were hearts put more at rest, or did hope gleam in upon such a multitude of squaws; never did eyes dance in frames of such emotion, or smiles radiate faces with such animation. Never was the "*neaw*!"—a term expressive of mingled surprise and gladness—uttered with such vehemence and joy. Even the paposes, turning from their sources of nourishment, looked round as if some new and blessed influence was felt by them; and the very dogs barked.

Meantime a voyager had procured of an old squaw her petticoat, stiff with the accumulated grease and dirt of many years. As he ascended the mound with this relic, another mutter of vengeance was heard from the men, whose faces were black with rage; but it was literally drowned amidst the acclamations that broke at this moment from the squaws. Now they saw, for the first time, new light and new hope breaking in upon their destiny. Our burdens, they seemed to say, will be lighter, our rights more respected, our security more secure. There stood the voyager, holding the petticoat. The sight of both was far more obnoxious to the culprit than would have been the executioner armed with his axe. But still he was unmoved. Not a muscle stirred. Around his waist was a belt, with a knife in it, such as butchers use. Taking hold of the handle, I drew it from its scabbard, thrust the blade into a crack in the flag-staff, and broke it off at the handle; then putting the handle in the culprit's hand, I raised it well and high up, and said, "No man who employs his knife as this man employs his, has a right to carry one. Henceforth this shall be the only knife he shall ever use. Woman, wherever she is, should be protected by man, not murdered. She is man's best friend. The Great Spirit gave her to man to be one with him, and to bless him; and man, whether red or white, should love her, and make her happy." Then turning to the voyager, I told him to strip off his leggins and his ornaments. It was done, when the old petticoat was put on him. Being thus arrayed, the voyagers, each putting a hand upon his shoulders, ran him down the mound, amidst a storm of indignation from the men, mingled with every variety of gladsome utterance by the squaws; when, letting him go, he continued his trot alone to a lodge near by, rushed into it, and fell upon his face. An interpreter followed him, and reported his condition, and what he said. His first words, as he lay on his face, were—"I wish they had killed me. I went up the mound to be shot. I thought I was taken there to be shot. I'd rather be dead. I am no longer a brave; I'm a woman!"

Now, this mode of punishment was intended to

produce moral results, and to elevate the condition of women among the Indians. It was mild in its physical effects, but more terrible than death in its action and consequences upon the offender. Henceforth, and as long as I continued to hear of this "brave," he had not been admitted among his former associates, but was pushed aside, as having lost the characteristics of his sex, and doomed to the performance of woman's labour, in all the drudgery to which she is subject, as well of the lodge, as of all other menial things. The whisky-trader had made off, or he would have been taught a lesson which, with the proper using, might have been made useful to him for the remainder of his days.'

On one occasion, when visiting the Choctaw nation, Mr McKenney was introduced to a professional 'rain-maker.' This personage had the address to pass himself off among his brethren as one who was in alliance with the Great Spirit, and could produce plenteous showers by his intercessions.

'I shook hands with him, and told him I was glad to see him; that I had heard of his greatness; and that I was so anxious to know the secret of rain-making, that I would give him an order on the agent for a pair of scarlet leggins, a pound of tobacco, a string of wampum, a pound of powder, two pounds of lead, and a blanket, if he would tell me all about it. He stood up, and looked around him; and then, holding his head first on one side, and then on the other, listened; when, looking well round him again, he sat down, saying to the interpreter, "Ask him if he will give me these things." Most certainly, I replied, upon the condition that he will tell me all about his art as a rain-maker. He stood up again, and looked and listened, and then seating himself, began:—

"Long time ago I was lying in the shade of a tree on the side of a valley. There had been no rain for a long time—the tongues of the horses, and cattle, and dogs, all being out of their mouths, and they panted for some water. I was thirsty—everybody was dry. The leaves were all parched up, and the sun was hot. I was sorry; when, looking up, the Great Spirit snapped his eyes, and fire flew out of them in streams all over the heavens. He spoke, and the earth shook. Just as the fire streamed from the eyes of the Great Spirit, I saw a pine-tree, that stood on the other side of the valley, torn all to pieces by the fire. The bark and limbs flew all round, and then all was still. Then the Great Spirit spoke to me, and said, 'Go to that pine-tree, and dig down to the root where the earth is stirred up, and you will find what split the tree. Take it, wrap it carefully up, and wear it next your body; and when the earth shall become dry again, and the horses and cattle suffer for water, go out on some hill-top, and ask me, and I will make it rain.' I have obeyed the Great Spirit; and ever since, when I ask him, he makes it rain."

'I asked to see this thunderbolt that had shivered the pine-tree. He rose upon his feet again, and looking well around him, sat down, and drawing from his bosom a roll which was fastened round his neck by a bit of deer-skin, began to unwrap the folds. These were of every sort of thing—a piece of old blanket; then one of calico; another of cotton—laying each piece, as he removed it, carefully on his knee. At last, and after taking off as many folds as were once employed to encase an Egyptian mummy, he came to one that was made of deer-skin, which being unwound, he took out the thunderbolt, and holding it with great care between his finger and thumb, said, "This is it!" I took it, and examined it with an expression of great interest, telling him it certainly was a wonderful revelation, and a great sight; then handing it back to him, he carefully wrapped it up again with the same wrappers, and put it back in his bosom.

'The reader is no doubt curious to know what this talismanic charm, this thunderbolt was. Well, it was nothing more nor less than that part of a glass stopper that fills the mouth of a decanter, the upper or flat part having been broken off!

'I wrote, and gave him an order for the presents, when he shook hands and left me, doubtless much edified, as well as benefited, by the interview, to carry on his operations as a rain-maker till it should rain.'

BLACK-FISHING.

It is generally known that salmon, during the winter months, swim up rivers to spawn; and, having obeyed this instinctive impulse, that they return in a lean and unsound condition to the ocean. To attack and kill the poor creatures while swimming up the streams, burdened with spawn, is cruel and murderous, for it is annihilating myriads of salmon which the spawn would in due season produce. To kill them coming down is not less brutal, for the animals are not in a fit state to be eaten: they are foul fish. In order to protect salmon in these circumstances, the law establishes a *close time*, during which, under heavy penalties, they must not be captured. Nevertheless, killing salmon while the rivers are legally shut is an exceedingly common offence. Along the whole course of the Tweed, and other rivers, this species of poaching is perpetrated nightly, on an extensive scale, by bands of men prepared to offer a determined resistance to authority. The plan usually pursued is to walk along the banks of the stream with burning wisps of straw or fagots, and the instinct of the salmon drawing them towards the light, they are readily speared. Many fish are thus killed while in the act of spawning. Touching the injurious consequences, individual and social, arising from these unfair practices, the following passages occur in an article on the subject in the Peeblesshire Advertiser, a small monthly paper of the kind we have frequently commended:—

'During the spawning season, not only the appearance, but the habits of the salmon are totally changed: the timid fish which, in its healthy state, is scared by a shadow, hiding itself in the deepest and strongest water, now exposes itself in the ebbest streams, with often scarcely enough of water to cover it, so that it can be caught with the greatest facility by means of any device, however simple, or indeed without the assistance of any device, but simply with the hand, so thoroughly does it put itself in the power of man at this season. It must be obvious, therefore, that if, in the violation of reason, mankind do not hesitate in destroying the fish, the law must be applied to prevent the utter extinction of the species. It is not unusual to hear persons, in their eagerness to vindicate a course to which they are addicted, argue that the fish, *under Providence*, expose themselves in the manner described, that they may easily fall into the hands of the people at a time when the necessity of using them for food is greatest. As well might they argue that birds and other animals might be destroyed when in a similar state; for assuredly no animal undergoes more deterioration than salmon do in similar circumstances. It is more on account of the welfare of the population, than any other reason, that we would endeavour to dissuade them from this pursuit. We may safely assert that no man can systematically follow any occupation denounced by the law of his country without having his moral nature grievously outraged; the very fact of its being forbidden, calls into exercise many degrading qualities—low cunning and duplicity of every description being necessary to commit and conceal the offence. It often results, too, in the commission of crimes at first not contemplated by the unfortunate persons themselves; namely, among others, in resisting the officers of the law, for which, instead of having to answer for the statutory offence of killing salmon in forbidden time, they may have to answer to a charge of assault, or, it may be, of murder! This is not a hypothetical case—it has unfortunately frequently arisen out of this and similar pursuits.'

So much may be said of the injurious consequences of *black-fishing*! as it is called; but we should scarcely be justified in dismissing the subject without pointing out

what we conceive to be the source of the evil. For four hundred years, as may be seen from acts of parliament, the law has been endeavouring to prevent this kind of poaching, and it has failed. In vain are the prisons more or less crowded every winter with black-fishers; in vain are heavy pecuniary penalties exacted; in vain are men ruined, generation after generation: the crime is now as rife as it was in the fifteenth century. Has it never occurred to the administrators of the law that there must be some cause for all this? Are they not aware of the excuse which black-fishers employ when challenged for their conduct? Let us give voice to this grumbling apology. The excuse of the men is, 'that they are dwellers on the banks of the river, and that if they did not catch the fish in close time, they would never be able to get them at all; because gentlemen, at the estuary and other places, set stake-nets to intercept and catch them wholesale.' Such is their mode of reasoning; and rude as it is, it carries with it an air of justification. We are not sure that the practice is not, in many instances, carried on from motives of vengeance, irrespective of any hope of profit. If such really be the case, how deplorable are the results ensuing from heedless legislation—a regular system of demoralisation arising from the constant effort to protect the interests of one party at the expense of another! To an unprejudiced observer, it will seem clear that the practice followed by landed proprietors, at the mouths of rivers, of sweeping up salmon wholesale, and so depriving all above them of any inducement to angle at the proper seasons, is inconsistent with equity, and must ever excite hostile feelings. What common-sense points out is this: rivers, from their source to their junction with the ocean, with all the creatures which dwell in them, are public property, or at least should be considered as such. It is true the law has imparted a right of private property with respect to the capturing of salmon by stake-nets; but surely this requires revision and modification, with a view to the public advantage. At present, as we lament to observe, the populace on the banks of rivers are in a continual embroilment respecting the right of fishing, and, as above stated, mercilessly destroy the salmon at illegal periods. What we desire to press is, a general reconsideration of the whole question, in order to allay disputes, and to give each man an interest in preserving the law inviolate.

TEMPERATURE OF THE HUMAN BODY.

INQUIRIES into the nature and sources of animal heat have ever occupied a large share of the attention of physiologists, from the days when a subtle fluid was supposed to be the mysterious medium for the diffusion of heat, until modern researches have shown it to be the result of a chemical operation. By careful and well-defined observations, attempts have been made to trace its influence in derangements of the normal condition of the animal economy. Among these the investigations of Dr Davy of Ambleside possess sufficient general utility to render an account of them interesting.

The doctor's observations were commenced about four years ago on some fishes proper to the Mediterranean, among which, contrary to the generally received opinion, he found that the sword-fish and tunny are warm-blooded; and in extending his inquiry, was led to remark that the increase of heat in fishes is in proportion to the increase of red particles in their blood: thus showing that these red particles are in some way connected with the generation of heat. These observations prepared the way for others on the human subject: the result hitherto obtained is, that the temperature of the body in health is not constant, but rises and falls under the general influences of heat and cold, rest and exercise.

The method pursued was by the introduction of a glass thermometer, bent at right angles, into the mouth, so as to enable the observer to read off the indications

as given by the mercury. The bulb must be placed as far back as possible, under the tongue, and the breathing be carried on through the nostrils. If introduced between the cheek and teeth, the temperature given will be under the real amount, as shown under the tongue, where it should be left for some minutes, to insure the maximum.

In a series of observations carried on daily for a period of eight months, the highest average temperature was found to be, just after the operator had risen in the morning, 98°74; the medium, about three hours after noon, 98°52; and the lowest, at the time of retiring to rest at midnight, 97°92. A corresponding depression of the respiration and pulse was noticed at the same hours. The temperature of the room in the morning was 50°9; and at night 62° on the average of the whole eight months; thus showing that the maximum temperature of the body is highest after the night's repose, and lowest at midnight, although at the latter period the atmosphere was many degrees warmer.

The effect of active exercise is to increase animal heat, when not carried to a fatiguing extent. The average temperature of 98° rose to 99°5 after a fourteen miles' ride under an August sun; the respiration and pulse quickened in a corresponding ratio. The proportion of heat to the amount of muscular exertion is seen in the sum of the results obtained after riding from seven to ten miles in a close carriage; which showed a lower temperature than any previously indicated, even by the midnight observations. Desultory walking exercise in cold weather is also attended by a depressing effect; there must be vigour and animation to insure an agreeable warmth. But the most lowering effects of all were noted after sitting, during service, in a church in which there was no fire. Notwithstanding warm clothing, a painful chill was experienced, with a strong tendency to drowsiness.

Excited and sustained attention, such as reading a lively book, the labour of literary composition, continued from two to five hours, has the effect of raising the temperature of the body slightly above the average; while, on the contrary, reading for mere amusement, or the mechanical process of copying, are shown to be followed by the same sedative and lowering result, as carriage exercise in comparison with muscular.

The taking of food into the stomach appears, from careful observations taken immediately after dinner, to have the effect of reducing the temperature: the more plentiful the meal, the greater would seem to be the depression. 'On particular occasions,' writes Dr Davy, 'when a larger quantity of wine than usual was taken, the reduction of temperature was commonly most strongly marked. A light meal, such as that of breakfast, consisting of tea, with a portion of toasted bread with butter, and often an egg, has had little effect in depressing or altering materially the temperature.'

From a few experiments tried on individuals advanced in life, the doctor finds that the animal heat in deeply-seated parts is greater than at middle age; which he accounts for by supposing that the food they eat is expended rather in the function of respiration than in compensating the waste of the system. The observations generally show that the temperature of man undergoes fluctuations in common with some other animal functions, and, like them, seems to obey a certain order—the one diurnal, in connexion with passive states of the body; the other accidental, dependent on irregular circumstances, exercise physical or mental, exposure to heat and cold. The temperature of various individuals, after working several hours in a heated factory, was found to be raised one or two degrees above the average; thus verifying the general proposition, that the heat of the body rises and falls with that of the atmosphere. Here, however, the doctor remarks that the increased heat penetrates but a short distance below the surface, whether it arise from surrounding causes, or from exercise. A certain law of compensation appears to come into play: 'by active exercise,

the pulse and the respiration are both accelerated; more oxygen, it may be presumed, is consumed; more heat is generated; the blood is made to circulate more rapidly, and is sent in larger quantities into the extremities, and where, in consequence, the excess of heat is conveyed and expended, and its accumulation in the central and deep-seated organs prevented, affording another striking example of harmonious adaptation.

Dr Davy truly observes that the extension of these observations over a greater number of subjects will lead to wider results, from which 'more particular inferences may be drawn, especially in conjunction with respiration and the heart's action, not without interest to physiology; and they may admit of important practical application to the regulation of clothing, the taking of exercise, the warming of dwelling-rooms—in brief, to various measures conducive to comfort, the prevention of disease, and its cure. A step in advance is made if it is only determined that, in the healthiest condition of the system, there is danger attending either extreme, either of low uniform temperature, or of a high uniform temperature; and that the circumstances which are proper to regulate variability within certain limits, not prevent it, are those which conduce most to health, as well as to agreeable sensation, enjoyment, and length of life.'

THE WEALTH OF CONTENTMENT.

'Poor and content is rich, and rich enough.'

SHAKESPEARE.

'We will this morning, if you please, take a walk up the turnpike-road, instead of our accustomed stroll to the beach,' said Mr Vincent, addressing his children.

'Why, papa? Do you not think that the beach is much more pleasant?' expostulated the youngest, a spirited boy of twelve.

'Yes, Charles, if I had no other object in view than the pleasure of the walk; but I wish to pay a visit to an old acquaintance—I may say an old friend—who lives in this neighbourhood.'

'Oh, that alters the case; I did not think that you knew any one here. Is he known to us?'

'No; nor do I remember even having mentioned him to you; but I wish you to accompany me, because I hope that the visit may afford you both gratification and profit.'

'Is he rich, papa? and has he beautiful pleasure-grounds to show us?' Charles eagerly inquired.

'He is rich, and he has beautiful pleasure-grounds; but I shall not tell you anything more concerning him till you have seen him.'

'Oh yes, dear papa; you have quite excited my curiosity: there must surely be something very peculiar about this gentleman: pray let us go. Does he live far off?'

'Not more than a mile. Do you think that you can walk so far, Lucy?' he asked, addressing a pale delicate girl who stood by his side, attired in her sea-side bonnet and plain muslin dress.

'Oh yes, dear papa; I feel so much stronger than I did when we first came here; and we shall, I suppose, have a rest when we reach your friend's house?'

'Certainly; we are sure of a hearty welcome. I can promise you that Mr Thompson will be pleased to see you.'

'Thompson! Is he any relation to the poet?' Charles interrogated.

'Not that I know of,' Mr Vincent returned with a smile. The father drew the hand of his invalid daughter within his arm, whilst his light-hearted and light-footed son bounded forward, full of anticipations of delight from the coming visit.

'What a beautiful little cottage!' Lucy suddenly exclaimed, as, on turning an angle of the road, a small thatched dwelling, literally overgrown with honeysuckles and jessamine, met their view. The words had scarcely escaped her lips ere a venerable old man, who was leaning over the gate, looking anxiously towards Mr Vincent, as if recognising a familiar face, came forth and grasped the extended hand of that gentleman, who greeted him as his 'good friend Thompson.'

'This is an unexpected pleasure, my dear young master,' he cried, whilst his intelligent countenance was lighted up

with an expression which testified the truth of his assertion.

'I have brought my children to see you, as we are making a few weeks' stay in the neighbourhood for the benefit of my daughter's health.'

'Miss looks very delicate,' the old man compassionately observed; 'and I am sorry that my dame is not at home to wait upon her. It is only on market days that she goes out: I am very sorry it has so happened.'

'I am sorry that we shall not have the pleasure of seeing your good wife to-day; but we could not foresee that she would be absent: indeed I did not know that you supplied the markets.'

'Oh, my dear master, I have grown quite a farmer of late. I have a cow, and a pig, and a roost of fowls; and my dame takes butter and eggs to the market every week.'

'I am truly rejoiced to hear that you have been so prosperous, Thompson.'

'Yes,' the old man rejoined; 'I was never in better circumstances, or happier in my life.'

'You seem always of a happy contented disposition,' observed Mr Vincent. 'I never knew you to dwell much upon the dark side of things.'

'No, sir; I always thought that it was not only more pleasant, but also more profitable, to look on the bright side; for a man cannot work when he is downhearted. Besides, we may always find blessings in our path if we only look for them; and I would rather thank God for his mercies, than murmur at the troubles he sees fit to lay on me. But,' he added with a half-repressed sigh, 'we have had a sore trial since I saw you last, which is, I think, sir, nearly fourteen years ago—a very sore trial,' and he dashed a glistening drop from his furrowed cheek with the sleeve of his coat. 'Our poor daughter and her husband both died in one week of a fever which was raging in these parts; and they left two children—babies you might have called them, for the eldest was not three years old—with no other provision than the workhouse.'

'That was indeed an affliction,' exclaimed Mr Vincent; 'one which needed no small exercise of Christian fortitude to sustain. And what has become of the little orphans?' he asked.

'Why, sir, my dame says to me, says she, "Well, John, we've lived together for these five-and-twenty years, and never wanted bread, and let us trust to Providence that we may not want it in our old age, and share our crust with the poor darlings." That's just like her, sir; she has a true woman's heart, and she's always the first in every good work.'

'But I will venture to say that you were nothing loath to second the proposal?' Mr Vincent rejoined.

'That I wasn't, sir; though, to be sure, we had a hard matter at first to fill their little mouths, and my old woman had a good deal of extra labour and trouble; but God has made these trials the means of a blessing; for of all the good grateful boys that ever lived, my little Sam is the best. He's a stout healthy lad now, and takes all the heavy work off my shoulders: he's gone to-day with his grandmother and sister to carry the basket. Then, sir, Polly is the cleverest little maid you ever saw; she's my dame's right hand: I don't know what we should do without either of them.' The old man had by this time conducted his visitors into the sitting-room of the cottage, which was in perfect keeping with the exterior. Lucy was delighted with everything she beheld, but Charles stood by with an air of evident disappointment.

'It is often the case that, by doing a generous or kind action without any hope of reward, we find a distant and altogether unexpected good result to ourselves,' Mr Vincent remarked, in connexion with the old man's last observation.

'That I take, sir, to be the meaning of the Scripture proverb, "Cast thy bread upon the waters, and thou shalt find it after many days."'

'True; and I think I may apply that proverb with equal appropriateness to a lesson which you taught me when a boy, and which you did not expect perhaps that I should remember and profit by to this day.'

'I, sir?'

'Yes; it was when you were in my father's service as gardener. I came running one evening to you whilst you were at work, in order to vent my ill-humour in fretful murmurs against some individual who had caused me a trifling disappointment. You listened with patience to my complaints, and then very quietly said, "Master Vincent,

I have myself had a *very heavy* disappointment to-day. I have lost a sum of money which I have for years looked forward towards possessing, intending with it to set up in business as a market gardener: it was a severe blow, young gentleman; but I said to myself, it's no use fretting about what can't be altered; my best way will be to go cheerfully on with my duties, and think of the blessings I still possess, instead of spending my time in vain regrets. Perhaps this money might not have done me the service which I thought it would, if I had had it; and I may be happier after all if I obtain an independence by my own industry. So I have comforted myself in this manner, Mr Vincent, and I am resolved to be satisfied with such things as I have." You said no more on the subject, my friend," Mr Vincent continued; "you made no attempt to apply the lesson to my case; but my conscience did it for you; and I was so thoroughly ashamed of my fretfulness and discontent, that I have never, I hope, given way to such feelings since that hour."

Their venerable host only smiled on this reminiscence of his early days, and apologising for his awkwardness, proceeded to perform the rights of hospitality, by spreading before his guest the best fare his humble home afforded. This consisted of milk, home-made bread and butter, and fruit.

"Oh, papa, how could you say that Mr Thompson was a friend of yours, when he was only a servant, and that he was a rich man, and had beautiful pleasure-grounds?" Charles almost angrily exclaimed, when they had left the garden gate to return home.

"And may not a servant be a friend?" Mr Vincent asked. "Many a servant," he proceeded, "has been a true friend to his master; and I think that I have proved to you, by the little anecdote I related, that Thompson was such to me."

"But how could you call him rich?" Charles interposed.

"He is rich, my son."

"How, papa?"

"I think that I can guess in what his riches consist," Lucy interposed; "papa means that he is rich in contentment."

"I do, my dear girl; and that is the most valuable riches a man *can* possess; without it, he is poor and miserable, though he may be surrounded by everything which could otherwise administer to his comfort and happiness."

"But I thought that I should see a gentleman, and have a delightful walk in the pleasure-grounds you spoke of. I am certainly disappointed, papa."

"I did not deceive you, Charles, even on this point; for I am sure old Thompson's little flower and kitchen gardens are better deserving the name of pleasure-grounds, than many of the expensively laid out parterres of the wealthy. They frequently have flowers and shrubs, grottoes and statues, and seldom or never visit them; whilst I will venture to say that the good old gardener we have just quitted experiences the most exquisite enjoyment from the cultivation of his pinks and roses. I noticed your disappointment and chagrin," his father continued, "though I would not appear to do so, and it grieved me beyond measure to witness it; but I have told you how, when a boy, I gave way to a similar spirit, and I now hope that you will, like me, take a lesson for your future life from this contented old man."

LITERARY SYCOPHANCY.

HORACE WALPOLE, in his 'Letters,' relates that the Abbé Giaminiani, a noble Genoese, wrote a panegyric in verse on the empress queen. 'She rewarded him with a gold snuff-box set with diamonds, and a patent of theologian. Finding the trade so lucrative, he wrote another on the king of Prussia, who sent him a horn box, telling him that he knew his vow of poverty would not let him touch gold; and that, having no theologians, he had sent him a patent to be captain of horse in those very troops that he had commended so much in his verses! I am persuaded that the saving the gold and brilliants was not the part which pleased his majesty the least.'

In August 1787, the prize of poetry, proposed by the Comte d'Artois, for an eulogy on Prince Leopold of Brunswick, was granted to M. Terrasse de Marseilles, an officer in the queen's household, although the public thought his production inferior to that of M. Noel, professor in the college of Louis le Grand, who obtained the first accessit; but the queen, on being informed that her officer above

named had appeared as a candidate, wrote three letters to the academy in his favour, designating the piece only by the motto, without giving the author's name. The academy, fancying from this that the king himself (Louis XVIII.) was among the candidates, and that the queen was eager for his success, accorded him the prize, or at least thought they had done so; but, on opening the capsule, they were not a little astonished to find, in lieu of the august name of Leopold's brother, the name of a common officer of the queen.

A fashionable authoress complimented Frederick the Great very extravagantly, saying 'that he was covered with glory, was the paragon of Europe, and, in short, the greatest monarch and man on earth.' The king, rather distressed at this fulsomeness, replied, 'Madam, you are as handsome as an angel, witty, elegant, and agreeable; in short, you possess all the amiable qualities; *but you paint.*'

Louis XIV. was weak enough to relish flattery. He found delight in singing the most fulsome passages of songs written in his own praise. Even at the public suppers, when the band played the airs to which they were set, the monarch delighted his courtiers by humming the same passages. What sort of courtiers he had about him may be inferred from the fact that one of them, when dying, begged pardon of the king for the 'ugly faces' which the acuteness of his suffering compelled him to make.

This vice of flattery and fawning sycophancy is sometimes practised even by reverend authors. Thus, in some very adulatory doggerel on our present sovereign, written by a minor canon of Windsor, we are assured that there is 'none so fair, so pure as she.'

Although the poet Young could complain that

'The flowers of eloquence, profusely poured
O'er spotted vice, fill half the lettered world,'

and elsewhere exclaims,

'Shall funeral eloquence her colours spread,
And scatter roses on the wealthy dead?
Shall authors smile on such illustrious days,
And satirise with nothing—but their praise?'

yet he himself disgraced his talents, and lowered his reputation, by the mean flattery with which he stuffed his dedications to great men. This foible of his character is thus cleverly touched on by Swift:—

'And Young must torture his invention
To flatter knaves, or lose his pension.'

Sometimes authors heap the most outrageously absurd laudation upon one another. In this reckless and unmeasured way of praising, Jasper Mayne has no hesitation in saying of 'Master Cartwright,' author of some tolerable 'Comedies and Poems' (1651)—

'Yes, thou to nature hadst joined art and skill;
In thee Ben Jonson still held Shakspeare's quill.'

Mrs Thrale relates that Hannah More, on being introduced to Dr Johnson, began singing his praise in the warmest manner, and talking of the pleasure and the instruction she had received from his writings with the highest encomiums. For some time he heard her with that quietness which a long use of praise had given him; she then redoubled her strokes, and, as Mr Seward calls it, peppered still more highly, till at length he turned suddenly to her, with a stern and angry countenance, and said, 'Madam, before you flatter a man so grossly to his face, you should consider whether or not your flattery is worth having.'

AFFECTION.

We sometimes meet with men who seem to think that any indulgence in an affectionate feeling is weakness. They will return from a journey and greet their families with a distant dignity, and move among their children with the cold and lofty splendour of an iceberg, surrounded by its broken fragments. There is hardly a more unnatural sight on earth than one of those families without a heart. A father had better extinguish his boy's eyes than take away his heart. Who that has experienced the joys of friendship, and values sympathy and affection, would not rather lose all that is beautiful in nature's scenery, than be robbed of the hidden treasure of his heart? Who would not rather bury his wife than bury his love for her? Who would not rather follow his child to the grave, than entomb

his parental affection? Cherish, then, your heart's best affections. Indulge in the warm and gushing emotions of filial, parental, and fraternal love. Think it not a weakness. God is love. Love God, love everybody, and everything that is lovely. Teach your children to love; to love the rose, the robin; to love their parents; to love their God. Let it be the studied object of their domestic culture to give them warm hearts, ardent affections. Bind your whole family together by these strong cords. You cannot make them too strong. Religion is love; love to God; love to man.—*American newspaper.*

ARTS DERIVED FROM THE WORKS OF NATURE.

In the early days of railway engineering, we had commenced by laying the iron rails on blocks of stone, placed apart; the engineer did not reflect upon the construction of the human frame, in which the cartilage was placed to support and protect the bones; had he done so, he would have then adopted a continuous bearing. Sir Christopher Wren, in the steeple of St Bride's, had shown the advantages which might be derived from the works of nature. Reflecting that the hollow spire, which he had seen or built in so many varieties, was but an infirm structure, he sought some model which should enable him to give it the utmost solidity and duration. Finding that the delicate shell called turretella, though long, and liable to fracture from the action of the water amongst the rocks, remained unbroken, in consequence of the central column round which the spiral turned, he adopted the idea. Therefore, in the centre of the spire he placed the columella, surrounded by a spiral staircase, and had thus constructed, if not the most beautiful, at least the most remarkable and enduring of any spire yet erected. Also, when Brunelleschi designed the dome of Santa Maria at Florence, the diameter of which was nearly equal to that of the Pantheon, but which stood at more than twice the height from the pavement, upon a base raised on piers, it was evident that, in giving it the same solidity as its original model, the weight could not be supported on such a foundation. But Brunelleschi was an observer of nature; he reflected that the bones of animals, especially of birds, had solidity without weight, through the double crust and hollow within. But, above all, he remarked that the dome which crowned the human form divine was constructed with a double plate, connected together at intervals, and thus the utmost strength and lightness were combined. Therefore he followed this model in the dome of Santa Maria, and the traveller now ascends to the summit between the two crusts or plates forming the inner and outer domes. The same contrivance was adopted by Michael Angelo in the dome of St Peter's, and in almost every dome that had been constructed since that time.—*The Builder.*

EXPENSE OF PUBLICATION.

The community at large have a very imperfect notion of the sums of money which are expended in the publication of books. Sir R. Worsley spent twenty-seven thousand pounds in the publication of his grand work, entitled 'Museum Worsleyanum, or an Account of his Collection of Antiquities,' in two volumes, imperial folio, privately printed during the years 1794 and 1803. There was an expenditure, and consequent risk, of twenty thousand pounds on Dr Dibden's four works, 'The Spencer Library,' 'Ædes Althorpiæ,' 'Bibliographical Decameron,' and 'Bibliographical Tour.' Dr Edmund Castell expended his whole fortune, twelve thousand pounds, on his 'Lexicon Heptaglotton,' 1669; and he also lost his sight in preparing the work, to which he is said to have devoted eighteen hours daily for seventeen years. Dr Barnes spent his whole fortune on his admirable and learned edition of 'Homer's Works,' published in two quarto volumes in 1711. The French Polyglot Bible of 1645, in ten folio volumes, was the undertaking of Guy Michel le Jay, an advocate of Paris, who, having spent his fortune on its completion, declined Cardinal Richelieu's offer to pay part of the expenditure, on condition of the work being allowed to come forth in his name, preferring to submit to poverty rather than to share with any one the glory of so great an enterprise. Mr Jungmann, a zealous Bohemian patriot, has lately sold a vineyard to defray the expense of publishing a dictionary of his native language. In England, the expense of publishing would be considerably lessened by the removal of the nearly thirty per cent. tax on paper, and the hundred per cent. tax on advertisements.

THE SONG OF THE SWORD.

A PARODY ON THE 'SONG OF THE SHIRT.'

WEARY, and wounded, and worn,
Wounded, and ready to die,
A soldier they left, all alone and forlorn,
On the field of the battle to lie.
The dead and the dying alone
Could their presence and pity afford;
Whilst, with a sad and a terrible tone,
He sang the song of the sword.
Fight—fight—fight!
Though a thousand fathers die;
Fight—fight—fight!
Though thousands of children cry;
Fight—fight—fight!
Whilst mothers and wives lament;
And fight—fight—fight!
Whilst millions of money are spent.
Fight—fight—fight!
Should the cause be foul or fair;
Though all that's gained is an empty name
And a tax too great to bear:
An empty name and a paltry fame,
And thousands lying dead;
Whilst every glorious victory
Must raise the price of bread.
War—war—war!
Fire, and famine, and sword;
Desolate fields, and desolate towns,
And thousands scattered abroad,
With never a home and never a shed:
Whilst kingdoms perish and fall,
And hundreds of thousands are lying dead,
And all—for nothing at all.
War—war—war!
Musket, and powder, and ball:
Ah! what do we fight so for?
Ah! why have we battles at all?
'Tis justice must be done, they say,
The nation's honour to keep;
Alas! that justice is so dear,
And human life so cheap.
War—war—war!
Misery, murder, and crime,
Are all the blessings I've seen in thee
From my youth to the present time;
Misery, murder, and crime—
Crime, misery, murder, and wo:
Ah! would I had known in my younger days
A tenth of what now I know!
Ah! had I but known in my happier days,
In my hours of boyish glee,
A tenth of the horrors and crime of war—
A tithe of its misery!
I new had been joining a happy band
Of wife and children dear,
And I had died in my native land,
Instead of dying here.
And many a long, long day of wo,
And sleepless nights untold,
And drenching rain, and drifting snow,
And weariness, famine, and cold;
And worn-out limbs, and aching heart,
And grief too great to tell,
And bleeding wound, and piercing smart,
Had I escaped full well.
Weary, and wounded, and worn,
Wounded, and ready to die,
A soldier they left, all alone and forlorn,
On the field of the battle to lie.
The dead and the dying alone
Could their presence and pity afford;
Whilst thus, with a sad and a terrible tone,
(Oh, would that these truths were more perfectly known!)
He sang the song of the sword.

PACIFICUS.

NOTE.

Finding the interests of a contributor concerned in the matter, we take leave to state that a note to a tale entitled *Next of Kin*, in No. 487 of the Journal, was erroneous regarding the authorship of that story. It is said to have been by a person deceased, from whom we had received another story entitled *The Fitting*; the fact being, as we afterwards discovered, that the paper was contributed by a different person.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. S. ORR, 147 Strand, and Amen Corner, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 159. NEW SERIES.

SATURDAY, JANUARY 16, 1847.

PRICE 1½d.

CURIOSITY.

CURIOSITY, or the desire of knowing, is an instinct not peculiar to the human race, although in the lower animals, as in some of our own species, it is bounded by the general narrowness of the intellect. An ape, for instance, is satisfied with his examination of a particular object; and although addicted more to the analytical than the synthetical process, he contemplates wisely its parts, and recognises them again when he meets them as a whole. But this study leads to no results beyond fun or mischief. The step in knowledge he has gained does not conduct him onwards. His inquiry terminates when the immediate question is answered; and his vagrant curiosity flits away to other objects.

In some portions of the human species we observe nearly the same thing. The curiosity, for instance, which pries into the domestic affairs of other people, which pants to know the price of a bonnet, or the arrangement of a dinner, is the same natural instinct neutralised for all good purposes by the same intellectual weakness. If it were capable of going further—of being led on, step by step, from specialities to generals—of theorising an individual character from the minute details of life—and ascending thence to speculations on the moral status and destiny of the species—then would this kind of curiosity, however annoying and vexatious in its exercise, be taken out of the category of vulgar instincts common to men and animals, and become one of the great agents in the progress of the human race.

I do not complain of people for seeking to learn even the most trifling particulars of my domestic economy; but I wish to know what they mean to do with them when obtained. Of what use are the scraps of information they collect with so much trouble? Have they displayed in the pursuit anything more than the unreflecting ingenuity of the ape? Are they capable of turning their acquisitions to any wiser or more useful account? But the parallel is closer still; for in nine cases out of ten the proceedings of the two animals, higher and lower, tend to mischief. The same weakness of character which leads people to waste their minds in such paltry inquisitiveness, prevents them from keeping to themselves what they may have gained. They are afflicted with an incontinence of knowledge, and to such an extent, that its acquisition would give little pleasure but for the prospect of retailing it. Hence gossip, scandal, slander, are the usual attendants upon idle curiosity; and an imbecility becomes formidable which would otherwise be only pitied or despised.

Ascending from this limited curiosity, we arrive, a degree higher perhaps, at passive curiosity—a passion, or rather habit, which abstracts itself from the things and persons of life, to fix upon imaginary beings, and

trace with eager interest the thread of a fictitious narrative. It happens, fortunately, that this taste is not always inconsistent with a proper attention to the real business of society; for all students of the kind do not imagine, with the poet Gray, that supreme beatitude consists in lounging upon a sofa morning, noon, and night, and reading eternal new romances. Some study such productions as works of art; others peruse them for occasional recreation; and a few have recourse to them, as a more innocent kind of dram-drinking, in those pauses of the world when their jaded minds would otherwise prey upon themselves. Still, there is no doubt that vast numbers of weak minds, in all civilised countries, look to them for nearly their sole intellectual food. In France, England, Germany—the most literary and enlightened nations in Europe—the press teems with the fantastic brood; and in China, where one-third part of mankind read, if they do not speak, one universal language, fiction is the grand staple of the national literature.

This passive curiosity, like the limited curiosity already described, is confined by the general weakness of the character of which it forms a part. Were it otherwise, it would infallibly lead to the study of history, which is still only narrative, although of a higher kind, unfolding the destinies of men, not in little groups, but in large aggregates, and describing the action and reaction of individuals and masses. I am not sure, however, that a distaste for history is the result of romance reading. The distaste already exists in the weakness of the character, and romances serve only to fill a mind which is of too confined a calibre to admit history.

As we ascend higher, we find the same instinct assuming a more and more important character. No longer confined to the investigation of a neighbour's domestic affairs, or fixed to the sofa in the lazy paradise of the poet, it is busying itself with the courses of the stars, tracing the affinities of earthly bodies, or plunging into the depths of the human understanding. This moral chameleon takes its hue from the mind in which it lives. The sciences had probably all their origin in mere curiosity, and often curiosity of a kind quite irrespective of eventual advantage. The great men whose genius has enlightened the world did not set about their task like one of the advertisers of British plate, who kindly took the trouble the other day of 'discovering' this substitute for silver on complaints reaching his ears of the frequency of thefts of the real metal! Attracted at first by accident to a pursuit consonant to their genius, they ascended, stage by stage, by unwearied perseverance; and thus the little seeker of daisies and buttercups became in time a distinguished botanist; and the juvenile rabbit-keeper extended gradually his care over the whole animal kingdom, and enlightened the world on the classifications of zoology. In such

cases the progress of the individual is not owing merely to stronger curiosity, but to general strength of character, which impels him to press onwards and upwards from every new acquisition. Without this his curiosity would never have led him beyond the meadow or the rabbit-hutch.

It is hardly necessary to enlarge upon the wise provision of nature in endowing different men with talents and propensities of a different kind. A very striking analogy might be drawn in this respect between the intellectual and the physical world; in both of which are soils of such different capacities and aptitudes, as to supply, in the aggregate, the varied wants and wishes of the whole world. Education in the one is what cultivation is in the other; and it should not be forgotten of both, that wherever the weeds are strong, useful plants will grow; and that the soil which is rich enough to produce articles of mere taste and luxury, will yield as easily to our demands the useful and the admirable.

The progress and victories of curiosity in the present age are reckoned marvellous; but the marvel is perfectly susceptible of explanation. In former times, owing to the limited diffusion of books, men worked in a great measure alone: each was mainly dependent upon his own experience, receiving but little assistance from that of others; and thus the acquisitions of a lifetime added comparatively little to the general stock of knowledge. The workers in those days, owing to the want of education, were few; and thus science, like the Scriptural seed scattered by the sower, fell among thorns and stony places, and comparatively little upon ground adapted for its reception. All this was changed by the mere invention of a mechanical art certainly not remarkable for complication or ingenuity. Books were multiplied by the press, and knowledge gradually penetrated throughout the holes and corners of society. The mind of Europe awoke slowly from its slumber, and the movement became quicker and quicker every year, till we are now confounded by its rapidity. How could it be otherwise? If a given number of minds produced so much, what will not be produced when that number is multiplied by many thousands? But books, besides, serve as stages in our onward progress. No man has now to pierce the wilderness for himself; the track is distinctly laid down, and his own difficulties and services only commence when he has reached the farthest point attained by his predecessors.

Let us not despise even the errors of the pioneers of science. Everything with them was a wonder and a mystery. Their new-born curiosity led them, like the wandering knights of old, to plunge into the depths of primeval woods, and sound the horn at the gate of enchanted castles. They traced a ghastly connexion between the material and immaterial world, demanding substance from shadows, and confounding things with words. Their mistakes, however, became our guide, and their darkness our light. We no longer waste our energies in the pursuit of phantoms, being acquainted with mightier geni than those sought in vain to be evoked by our ancestors. Even the gods and goddesses of mythology, the personified elements of nature, are no longer our masters, but our slaves. And this sacred thirst of knowledge can never be quenched; for every draught we take, while it appeases the pain, only increases the rage. Who shall say where that magnificent curiosity, which is the great distinctive feature of the age, shall stop, or where its discoveries will end? A philosopher of our own day laughed to scorn the fantastic idea of lighting the streets with gas, and another demonstrated the folly of trying to cross the ocean by means of steam. But our practical men attempted these impossibilities, 'yea, got the better of them.' We now not only rush through the country, from end to end, at several times the rate of the mail-coach pace, which was in its time the admiration of Europe, but we send before us, as an avant-courier, one of the dainty spirits of nature, who could put a girdle round the earth in less than a second. If an arm of the sea interpose, our com-

munications need not wait for steam, already too slow for our proud impatience: our commands are transmitted through the body of the waters with a velocity which mocks the lazy flight of a cannon ball!

Such things seem wonderful to us, but they will be a very simple matter for posterity. The ratio of the progress of invention and discovery is neither arithmetical nor geometrical. In our generation we call it marvellous—what will it be in the next? If the art of printing confessedly performed such mighty things when its benefits were confined to the few, what will it do now that they are diffused among the multitude? How many minds, that would otherwise have slept for ever, are at this moment awakening to intellectual life under the influence of the cheap press of Great Britain! And the work, be it remembered, to which these minds are called is *unlimited*. There can be no glut of labour, for we are only at the opening of that eternal quarry, the riches and extent of which are beyond all imagination.

But nature, however wonderful, is always simple. The great agent she employs in the human character is merely well-directed curiosity—a fact which must be familiar to intelligent parents, and the observant instructors of youth. The boy's tastes become the man's business, and wo to those who fail to mould and train the former when as yet they are soft and ductile enough to be acted upon by Education.

THE TWO AUNTS.

A TALE.

HOWEVER necessary it may be to use the curb with boys, there should, we think, be a leaning to mild principles in the education of girls. The character to be dealt with in the latter case is usually of a kind which only can be nurtured into perfection by gentle treatment, and we never yet knew a female heart to possess any value which was only to be operated upon through the medium of fear. To mothers of the middle classes especially, where individuality of character is of importance, we would say, treat your daughters with all the indulgence that may seem at all consistent with a prudent caution. Teach them, by kindness, to be generous-hearted, unsuspicious, trusting, loving; let a consciousness that you wish, even in trifles, to make them happy, strengthen the spring of hope in their minds, so that this elastic feeling, surviving the ignorance of their childhood, and growing with their growth, may carry them forward through many a privation, many a subsequent trial; and then, even if none but adverse circumstances should await them, if the loving heart must meet a chill, the trusting heart be betrayed, never, never imagine that the treasures of early affection made them the less prepared for the reverse, but believe, with the Athenian of old, that it was something at least to have given them 'one happy day.'

These thoughts were awakened by circumstances which lately came under our observation, and which would have convinced us, if proof were requisite, that of the two extremes, indulgence is far more favourable to the right development of the female heart than severity; though of course no truly beneficial result can be expected, unless even our favourite treatment be judiciously applied. In our neighbourhood, which I need only say was in the south of Ireland, there some time ago lived, each in a house by herself, two aged sisters, one of whom, Jane, had never been married, the other, Nance, was a widow, but without children. Why they did not live together it is difficult to say, unless their separation was a result of a considerable difference in temperament. Slender as their means were—for they belonged to a humble condition in life—a circumstance occurred which rendered it necessary for each to make these resources go still farther. A young wife, their sister-in-law, gave birth to twin-daughters, and died in her confinement. Her husband, with that brief interval of happiness continually in his mind, never afterwards

'raised his head,' but pined in gloom through three or four weary years, and then followed her to the grave, leaving the little orphans to the care of his sisters—one to each. They were poor, shy, awkward, neglected little things; and the two childless women, each according to her own peculiar character, welcomed the claim upon their sympathy, and resolved, as far as in them lay, to supply to them a mother's place.

But with what different ideas! Jane, accustomed to solitude, compassionate, reflecting, finding her only recreation in attending to her garden and the poor, rejoiced in the little creature that now was to give life to her lonely hours; she treated her with the tenderness that she would have bestowed on one of her own fair blossoms; she spoke to her with the gentle tones with which she comforted the lowly; and thus combining all former duties, all amusement, in her present delight, she was soon rewarded by the entire confidence of its object, who, forgetful of her shyness, followed her, with tripping footsteps, round the garden, and through the house, her sweet voice and merry laughter echoing like a fairy bell.

And Nance, still elbowing her way through the world—active, enterprising, and sturdy—what did she know of the softer feelings of the heart? They had never been strongly called into action in her earlier life, and she now never imagined their existence; indeed we believe that, in her inmost soul, she utterly despised such weaknesses, and imputed much of her sister's early sorrows and her present lonely lot to indulgence in those fancies; and therefore she determined, as a duty, even had her temper not inclined that way, to bring up her little charge with the strictest discipline, to discourage each softer emotion, and confine her attention to the less pleasing realities of life, convinced that kind words and caresses were more injurious to her mind than the most cloying sweetmeats would have been to her body.

Some months had passed away, and Nance had removed to a small farm taken by her late husband at a little distance from the village, so that the intercourse between the sisters was not frequent. But one morning Jane was surprised to see her enter the cottage with limping step; and eagerly inquiring whether she had met with any accident, desired little Margaret at the same moment to bring her a chair. With ready courtesy the child obeyed, and then retreating to her little stool at Jane's knee, resumed her work, looking up every now and then, with no admiring expression, at her other aunt.

In answer to Jane's repeated inquiry, Nance replied, 'Oh, 'tis only a trifle; but the walk made it painful: nothing would do that young minx at home but to go hunting the hens, and pelting them with stones; and when I ran out to stop her, she flung the last of them away, and hit me right on the instep, taking off a piece of the skin as large as a shilling. I'll be bound I gave her two or three good flakings, that kept her quiet for the rest of the day; but I could not put on a shoe or a stocking yesterday, and was obliged to stay at home from prayers, thanks to the little brat.'

Now, amongst the ravages of time, Nance had lost more than one of her once pearly teeth; this rendered her utterance at all times, but more especially when speaking in excitement, rather indistinct, besides which, those same inexorable years had deadened Jane's sense of hearing, so we must not be surprised at her answering Nance in a pleased and gentle tone—'Playthings—that was very considerate indeed of you to give the little creature some playthings, to keep her quiet within doors, instead of letting her run wild after the hens.'

'Playthings!' reiterated Nance in a tone of contemptuous impatience; 'indeed I would be well in my way making out playthings for her: no, I gave her some good flakings—flakings, Jane; and then I locked her up till she was tired of crying, and I did the same to-day, to keep her out of harm's way while I was out; that's the way to make them behave themselves right.'

She shook her head ominously at little Margaret, who nestled in still closer to her gentler guardian, while Jane, unwilling to enter into any discussion before her, contented herself with raising her hand in a deprecating manner, and the subject for the present dropped, to be often afterwards renewed, as each sister remonstrated with the other on a method so different from her own, each failing to produce any reformation, and each more and more convinced of the excellence of her own particular plan. Thus, while Bessy was drilled into a mere machine, efficient, indeed, often clever and off-handed, for Nance was determined to make her so, she still took no interest in any of her employments, but became each day more sullen, inert, and spiritless while in Nance's presence, more wild and thoughtless when the restraint was removed. Constantly under a dread of punishment, which was never adapted to touch her feelings or convince her reason, she became reckless when it was inevitable, sly and cunning while it could be averted: knowing that it was in vain to request any indulgence, she gradually acquired the habit of taking instead of asking leave, and, still worse, of appropriating what she could not obtain, too often covering the underhand practice by a deviation from the truth; and though sometimes discovered, and severely punished, still increased duplicity, instead of reformation, seemed the result of such chastisement.

Little Margaret, on the other hand, guided by the law of kindness, moved about at her daily avocations with blithe and gladsome looks, always endeavouring to do her best, or, failing in that, more sorry for the mischance than those who suffered by it. She took an interest, and felt a sort of property, in everything intrusted to her care; for did not all belong to dear Aunt Jane, who never denied her anything she could grant, or, if obliged to do so, had always the true and loving reason to reconcile her to the privation? She thus learned frankly to tell her thoughts and wishes, feeling, even through the difference of years, that she was relating them to a second self, only wiser, steadier, more experienced, but never less anxious or sympathising than she expected; and thus her young mind, moulded by constant application to that beloved model, received, even in its inmost recesses, the impression of that tried and gentle heart.

And thus they grew up; as twins, very similar in appearance, but with dispositions and expression of countenance as different as night and day. They were not much together; for, as we have said, neither aunt approved of the method of the other; and want of agreement on this important subject had, without impairing their affection, still lessened their intimacy. Visits were, however, at stated times exchanged, and no circumstance of particular interest ever occurred to one, without being immediately imparted to the other.

The girls had passed their eighteenth birthday at Aunt Jane's cottage. It had been her invariable practice to give them a little festival on this occasion; and Margaret, while delighted at poor Bessy's evident enjoyment, had seen more than ever to pity and deplore in her disposition and situation. The next morning she was talking over the subject with Aunt Jane, and proposing many warm-hearted but visionary plans, when suddenly the door opened, and the indefatigable Nance made her appearance. The visit was quite unexpected, and there was an excitement in her looks and movements which aroused Jane's apprehensions lest something unpleasant had occurred. Nance, however, seated herself deliberately, and laid her shawl and bonnet aside, as if for a lengthened stay; then addressing Margaret in kinder accents than she had perhaps ever in her life used towards her own ward, she requested her to bring her a drink of water from the old ivied well; 'for somehow,' added she, turning to Jane with an affectionate smile, 'I do not think the wide world holds another so pure or so refreshing.'

Jane's heart, ever dwelling on the past, gratefully acknowledged this little tribute to early memories, and

a quick gratified look from Margaret's sweet eyes showed her appreciation of it too. She took her pail and passed through the open door, and in silence the two aunts looked after her as she tripped lightly down the winding path; then their eyes met with a pleasant smile, and an expression of almost equal tenderness in each. 'She is a good girl,' exclaimed Nance with generous warmth; 'and no doubt, Jane, but, in the absence of other blessings, you have reared her to be a true one to yourself; very different will you feel whenever you are asked to part with her from the way I feel myself to-day.'

'If I parted with my darling for her own good,' answered Jane cheerfully, 'I hope I would not be so selfish as to indulge in one regret.'

'I believe you, Jane; 'twould be only like yourself: and if you were asked for a right hand or a right eye for the good of one you loved, I believe all the same that you would give it,' answered Nance with a merry laugh; 'but, after all,' added she, reverting to her favourite doctrine, 'that's no way to get through the world, and 'tis well if, in the end, Margaret hasn't too much feeling for her own good.'

'Not for her own happiness at anyrate,' replied Jane; 'and happiness here and hereafter is the only real good. But what have you to tell me, Nance; for I am sure when you came in you had something on your mind?'

'Indeed so I had, and great news too,' exclaimed Nance eagerly; 'but somehow the sight of you and that child, with your peaceful, innocent, loving ways, drove it for the moment out of my head, and made me feel in a different world. But I have no reason to reproach myself. I have reared her healthy, and useful, and obedient: if she's not very loving, why, I suppose it isn't in her nature. She ought to be grateful to me at anyrate, for I spared no pains to bring her up well, and now I have got the best match in the parish for her at last.'

'The best match!' exclaimed Jane; 'is it possible? Who in the world is he? and does Bessy like him?' added she still more eagerly.

'Oh, as to that,' answered Nance with a sort of grunt, 'I'd like to hear her object to a man with as fine a bawn of cows, and as honest a name as there is from this to himself. I'd like to ask her opinion indeed!'

'Oh, Nance!' exclaimed her sister in an expostulating tone; 'but still you have not told who he is.'

'No less a person, then, than Maurice Cruden of Knockane!' answered Nance in measured accents, drawing up her head to give greater dignity to the announcement, and disdaining to add another syllable to such an important fact.

'Indeed!' replied Jane, and there was a momentary pause—of triumph on one side, of consideration on the other. At last Jane smiled as she said, 'And yet, Nance, I cannot but ask you again, does Bessy prefer him? for, to my mind, he is very grave and settled, and rather precise for a wild thoughtless young creature like her.'

Nance interrupted her with a look half-angry, half-impatient, as she exclaimed, 'I vow to goodness, Jane, you never will learn sense. Here's a man with everything that heart could wish, and you insist on knowing whether a silly little monkey likes him: my only wonder is, that he liked or thought of her; but she may thank me for that.' Again Jane smiled, but did not raise her eyes, and Nance continued hastily—'But Bessy, after all, is not so foolish as you imagine; she's deep enough, and knows right well on what side her bread is buttered: besides, I believe she would not miss even a worse opportunity of getting away from me—there's gratitude. But no help for that. I assure you I left her quite agreeable, and brought over a message to ask you and Margaret to come back and spend the day, as Maurice is to be there too.'

While busied in their slight preparations for departure, Nance amused herself and them by expatiating unweariedly on the advantages of the expected con-

nexion. 'But Margaret here,' continued she suddenly, 'must be treated differently; for she, poor thing, is so differently reared. As to your having a heart, and a feeling one too, there's no question about that: if it wasn't there, child, Aunt Jane would have manufactured one for you; so all that I can do is to make it safe as quick as I can. And now no objections from either of you. When we are passing Mr Crosbie's lodge by and by, I must have my own way, and send up a message to the gardener that he must give a holiday to Laurence Quin, and let him come and spend the afternoon with us.' She silenced Margaret's faint remonstrances with a kiss, adding, with a knowing glance, 'Laurence is a smart, apprehensive boy, and will guess at once that he isn't asked to a settling family party of that kind for nothing. One match always brings on another, Margaret; so be sure you send a little bird to-morrow morning to tell me what the young gardener will whisper in your ear to-night when you are going home.'

On reaching the farm, as they passed within its shady enclosure along the margin of the little pond, Nance called on her companions to admire her fine collection of poultry dabbling in the stream, or swimming on the surface of the water. They had, however, hardly paused, ere her quick eye descried amongst the rushes the identical pair of Muscovy ducks whose death-warrant she had consigned to Bessy in the morning, and who, even while she gazed, took to the water, and, as if in mockery of their sentence, continued swimming up and down, displaying at every turn how well adapted they were for the table. An angry exclamation from Nance, a quick calculation whether another couple had suffered in their stead, and a thorough conviction that her entire clutch was still in the land of the living, was all the work of an instant, and with a threatening brow, and many an ejaculation at Bessy's forgetfulness, she had turned quickly away, and was hastening through the garden towards the house, when her attention was again arrested by the sight of a currant bush, the fruit of which she had ordered to be gathered for a pie, still exactly in the same state in which she had left it in the morning. She stopped short, and scanned it more closely; but there it stood, undoubtedly untouched, the branches bending with the ungathered clusters as gracefully as ever. Jane and Margaret thought she had again paused in admiration, and were just going to offer their tribute of praise, when they were suddenly silenced by a fresh burst of indignation from Nance, who, raising her eyes from the apparent fascination of the currant bush, spied beyond it a huge cauliflower, which, in honour of its size, had been destined for some great occasion, and directed this morning, in the fulness of her heart, to grace her intended festival. There it remained, stately as ever, its ample rotundity peeping out at every side through the encircling leaves it had so long outstripped. At this sight Nance absolutely recoiled, and with a gesture of speechless alarm, quite inexplicable to her visitors, hurried onwards into the house.

She called on Bessy, loudly—louder; till fright and anger elevated her voice into a scream; but still no reply. Participating in her alarm, without well understanding its origin, Aunt Jane and Margaret hastily searched through the house; but in vain. The latter then running out towards the offices, met the servant-maid coming in with some turf, and gathered from her that, half an hour after her mistress had left home, Peter Doyle and his sister had called for Miss Bessy, and prevailed on her to accompany them to the fair. She hastened back with this information to her Aunt Nance, who, worn out with excitement, was sitting on a bench in the little porch, fanning her heated face with her handkerchief, and rocking herself to and fro. At these tidings she started up with renewed energy, exclaiming, 'That rascally Peter Doyle—the very people I am for ever warning her against; and on such a day too, when she knew you were all expected, and that I wished to

have everything right; and Maurice Cruden coming too, and nothing ready.' For once Nance's presence of mind deserted her, and hopelessly wringing her hands, she burst into tears, overcome by the sudden overthrow of all her joyful anticipations.

Jane tried to comfort her sister, while Margaret, although herself exceedingly disappointed and uneasy at Bessy's absence, still endeavoured to excuse her, and then, with ready alacrity, hastened to assist in such preparations for dinner as could at that late hour be adopted; beguiling her anxious aunts into momentary forgetfulness by the little employments she assigned them, and even sometimes extorting a smile by the ingenious contrivances with which she sought to remedy the delay. Every moment, however, would they listen for Bessy's return, until at last Nance, with worn-out patience, exclaimed, 'The hussy will never come back till we send somebody to bring her back by force. She would be afraid now to face me alone, and knows right well that the Doyles dare not come into my sight. Only Tim went with the sheep, and rode old Dobbin, I'd have sent them both long ago to bring her back by book or crook; but 'tis only to have patience now.'

Dinner-hour arrived, and with it the unconscious Maurice Cruden, and Margaret's friend, young Laurence, full of happiness and smiles. Few smiles, however, now awaited them, though Nance, who considered it impolitic to mention Bessy's thoughtless conduct to her admirer, just casually remarked that something must have delayed her and her friends at the fair; and then covered her deeper anxiety under the appearance of excusable impatience for their return. But Margaret and Aunt Jane, both unpractised in dissembling, found it impossible to conceal their uneasiness, and might soon have betrayed all, had not Nance, with her usual generalship, requested Laurence to pay a professional visit to her pinks and roses, and desired Margaret to show him the way.

They had hardly reached the garden, when Laurence anxiously inquired what was the matter; and Margaret found that, to his heart at least, her disturbed countenance had spoken intelligibly. With tears and emotion springing from more than one source, she related the cause of her uneasiness, and found it involuntarily confirmed by the deep seriousness of manner with which he listened. At last, with much tenderness and hesitation, he informed her that Peter Doyle was commonly spoken of as an admirer, or, in his phrase, as 'a bachelor' of Bessy's; that she kept company with him much more frequently than her friends were aware of, or would approve; and that that very morning, when returning from a message of his master's, he had met the whole party, Bessy included, driving on a car in quite an opposite direction from the fair. 'And dear Margaret,' added he, 'without wishing to add to your trouble, I cannot but say something should be done at once; only give me the word, and I will set off this minute, and as a friend, as a brother, will try to save her from harm.'

'Oh thanks—thanks!—a thousand thanks, my kindest friend!' said poor Margaret, wringing her hands; but the colloquy was stopped by the sight of various persons of the neighbourhood returning from the fair, who, when questioned, declared that they had seen nothing of the fugitive. All concealment now being at an end, a family council was held, in which Maurice, to do him justice, took a cordial and disinterested part; and it was resolved that the moment a hasty dinner had been swallowed, the men of the party should immediately set out, and, tracing her direction, without ceremony or delay bring the truant back.

'And as I am to be one of her captors,' interposed Maurice with a good-natured smile, 'remember, Mrs Burke, I make it a condition that poor Bessy gets no scolding when she comes back; we were all young ourselves once, and were glad to take a holiday when it came in our way.'

The good-humoured light in which the person chiefly interested represented the matter, had its effect on the

rest of the party, and with something of composure they sat down to a dinner which Margaret's exertions had made perfectly comfortable; they even relaxed into many a laugh at Nance's consternation, many a compliment to Margaret's ingenuity, and were almost beginning to enjoy themselves, when a note was brought in by the servant, who had just returned from the fair, and handed to Nance. She at once recognised Bessy's handwriting, and grew deadly pale; and Margaret, rising hastily from her chair, threw her arm round her with a quick movement of support, as, taking the note from her powerless hand, she tore it open, and placed it before her. But the poor woman vainly tried to read, and handed it silently back to the agitated girl, whose tears fell like rain on the paper as she hurriedly perused it. It was enough: she did not speak, she gave no explanation; but pointing with her trembling finger to the one concluding word, she laid it again before the bewildered Nance, who, stooping over it, read mechanically and aloud the signature—'Bessy Doyle!'

We must hasten to conclude. It is said that 'misfortune never comes single'; so poor Margaret and her aunts had hardly recovered the shock of Bessy's elopement, and were vainly trying to reconcile themselves to the 'aggravation' of seeing her take up her residence in their neighbourhood as a member of an ill-conducted, unprincipled family, when their feelings were wrung afresh by the news that Laurence Quin, now Margaret's accepted lover, had been dismissed from his employment, on suspicion of systematically robbing the garden at the Park. At first such a rumour seemed utterly incredible, not only to Margaret's partial tenderness, and to Aunt Jane's scarcely less affectionate confidence, but even to the more sceptical worldliness of Nance; for Laurence had always borne an unexceptionable character, had no expensive habits, no dissipated companions to tempt him to such an act, and his undoubtedly genuine regard for one so innocent and engaging as Margaret, was in itself almost a pledge for his good conduct; but the report was only too true. He had lost his employment—a slur was on his name; and though Margaret had over and over again declared to him her perfect trust in his integrity, her firm conviction that it was all an error, which would one day be cleared up, she was still obliged reluctantly to yield to his own impetuous intreaty, and to the advice of even her indulgent Aunt Jane, that until this cloud had passed away, and his means of livelihood were again restored, their engagement should be suspended. She loved and she obeyed, though inwardly dissenting from an arrangement that seemed dictated by false pride on his part, and over-caution on hers; but to gratify them was her present wish, and for the rest she trusted to time and truth.

With affectionate earnestness she had pleaded for Bessy, and though unable to obtain her forgiveness from her aunts, still she had wrung a permission to visit her herself when she returned to her new dwelling; and day after day, during the hours when her husband and his family were likely not to interrupt her, she availed herself of it to seek an interview with her poor misguided sister. At first Bessy seemed inclined to carry matters with a high hand, and boasted of her adroit proceeding and freedom from restraint; but Margaret's watchful interest soon discovered that those gay spirits were too often forced and unnatural, and could not but suspect that poor Bessy's brief emancipation was only a prelude to stricter bondage; and that if Nance had beaten her with rods, she was chastised with scorpions now. Nance still held aloof with unchangeable determination. It was not anger alone; mingling with it in yet larger proportion was genuine grief at such a termination to all her cares; and, in addition, the inward mortification of suspecting that she had partly to blame herself, and that the system to which she had so pertinaciously and confidently adhered was a mistaken one after all. She could hardly bear to allow this, or to give even the gentle Jane such a triumph; but her mind

was working with sorrow and self-reproach; and though still unwilling to confess herself in error, she tacitly admitted it by the cordial encomiums she bestowed on Margaret's conduct, and by the privilege she granted her alone of occasionally mentioning the poor offender, and affectionately pleading her cause.

In the meantime, the depredations at the Park had not ceased, though now no longer confined to the garden; a wholesale robbery had been effected in the orchard, and several young ash-trees were cut, and silently removed in the night. Even Mr Crosbie's indolence could endure such trespasses no longer; for though he loved his own ease, he also loved a good table and a shady walk; so shaking off his habitual carelessness, he took active measures to ascertain the offenders, and offered a reward for their detection sufficient to put half the parish on the watch.

Those steps were effectual in checking further mischief, though not in bringing the actors in past delinquencies to light. There were many different opinions relative to Laurence, the majority declaring in his favour, and arguing that a long-established good character should not be whispered away on mere suspicion, while others, less magnanimous, asserted that suspicion almost amounted to proof; that the robberies had certainly been managed by some one well acquainted with the localities and habits at the Park; and who so likely as Laurence, who had been constantly employed there for years, and to whose old aunt, a market-woman in the next town, the fruit and vegetables had been traced? 'True, she had declared they were delivered to her by a stranger; but where was the fool who could believe such a story as that?'

And yet, as we have said, many did believe it; none more steadfastly than the friends he loved best. So, though under a cloud in the estimation of some, poor Laurence still found staunch and warm supporters, and anxiously awaited the result of Mr Crosbie's more stringent measures, trusting that they would yet be the means of discovering the real offenders. He had accompanied Aunt Jane and his fair Margaret on an afternoon visit to Nance, and their return had been delayed by an unexpected fall of rain. It continued until very late, but Jane had particular business to prevent her remaining; and when at last it cleared up into a lovely night, they set out, quite contented with the protection of Laurence's stout arm and shillelah. As they approached the Park, he exclaimed, 'I know a short cut across the demene that will bring us in half the time, and I can find my way there as well by night as by day, though,' added he with a half sigh, 'it is not to every one I should confess that!'

A trusting pressure of Margaret's hand on his arm checked the bitter feeling; and turning the conversation into a pleasanter channel, he guided them along by familiar paths until they reached the immediate neighbourhood of the 'great house.' Silently, and with light footsteps, they were crossing the short mown grass, when a slight rustle in the adjoining shrubbery caught Laurence's quick ear. With an impressive gesture he stopped short, then drawing his companions farther back into the shade, waited breathlessly, and with eyes accustomed to the gloom, for an explanation of the sound. For a moment or two all was still, then again the branches moved, and all three could plainly discern a man creeping stealthily along by the garden wall; another and another followed, until they reached a low arched door leading into the private pleasure-grounds, which was always strictly locked, but through which, nevertheless, after a slight pause, they disappeared. 'Now is my time!' exclaimed Laurence in suppressed but earnest tones; 'the hand of Providence is surely in this, and, with the blessing of God, we shall now discover all. Wait here in safety,' continued he, leading the trembling females to a bench under the deep shadow of a spreading beech, within a few paces of the front of the house—'remain quietly here, dear Margaret; you have a courageous heart, and will not be afraid. Remem-

ber all our hopes are now at stake; and if, in twenty minutes—where is Aunt Jane's watch, it will tell you the hour even in this dusky light?—I do not return, go to the hall door; do not knock, for that would be heard outside, but ring the bell, and give the alarm, for be sure then that something bad is going on.'

He left them, and in a moment had vanished through the little portal, and with noiseless footsteps on the grass beside the walk, was following on their track. He knew this piece of ground was merely ornamental, and perfectly enclosed; so hastening onwards to a glass door opening into the lower apartments at that side of the house, his worst apprehensions were verified by finding it open. For a moment he paused with natural hesitation, unwilling to enter a strange dwelling in secret, and at such an hour; while the thought that the individuals he had so dimly seen might, after all, have been members of the family, and that, if he were discovered within those precincts, it might confirm every previous suspicion, made him hesitate still more. But it was only for a moment: relying on the purity of his intentions, and his conviction that mischief was impending, he made up his mind, and resolutely but cautiously entered the house.

He was familiar with the somewhat intricate passages of this part of the mansion, which was appropriated to the domestics, and quietly made his way to a door at the foot of the staircase communicating with the principal apartments, but it was locked; and aware that this was a nightly habit with the family, he retreated, satisfied that so far at least they were safe. He then took the way towards the butler's pantry, knowing what temptation was there: this door was also shut, but a faint light was visible; and looking through the key-hole, he distinguished the three figures in the act of rapidly stowing away the plate! What would he have given at that moment for the key, to have turned it on them quickly, and left them secure; but they had apparently made good their entrance by picking the lock. The key, in all probability, was safe in the old butler's pocket, and before he could be aroused from his slumbers, the villains might escape. He was thus deliberating, when the loud and startling peal of the hall bell warned him that the twenty minutes had elapsed, and quick as thought, he anticipated the rush from within, by driving his cudgel into the staple of the pantry-door, which luckily opened outwards. For a moment this expedient checked their progress; but it could not long have resisted their united and desperate efforts, had not the continued pealing of the bell roused up a reinforcement, just as, with a final effort to clear their way, one of the robbers fired a pistol through the panel, wounding Laurence in the arm, and flinging him outwards with the shock. A rush of the servants from their apartments, and of the gentlemen from the upper part of the house, immediately followed the report; and at length, after a serious scuffle, the culprits were secured.

Laurence, too, was seized, soon to be released with many an apology and expression of heartfelt gratitude, as Jane and Margaret, with pale and terrified countenances, related their adventure, and wept over his wounded arm; but he reassured them all, by declaring it was only a trifle, and then attention was turned to the real delinquents. Bessy's husband was discovered amongst them. They were put into confinement, during the course of which one of them made a full confession of their past depredations, completely exonerating Laurence from all participation, and pointing out their real leader in a stable-boy, who had been dismissed some years before.

Those robberies were the secret which had weighed so heavily with poor Bessy, a secret of which she had little suspicion when she married, but which she discovered too soon—too late. Her unworthy husband was transported; and Nance, softened by compassion, and grown wiser by past experience, took the forlorn one back to her heart and to her home, where, in the full

tide of mutual affection and forgiveness, they never since have uttered, or had cause to utter, one harsh or one reproachful word.

We need not dwell on the happiness of Margaret and Aunt Jane. Laurence seemed doubly dear when steadfastly refusing Mr Crosbie's offered reward: he declared he could not bear to accept money for a discovery that had implicated poor Bessy's husband. His own innocence was clearly established, his good name restored, and that was all he desired, all he sought.

Mr Crosbie was obliged to acquiesce, but soon adopted a recompense more congenial to his feelings. He paid a handsome apprentice fee, and bound him for three years to Mr Drummond, the Scotch gardener of a neighbouring nobleman; and at the expiration of that time, it is arranged that old Green, his former master, shall be superannuated with a pension, and that dear Margaret shall be united to Laurence Quin, then 'head gardener' at the Park.

NATURE AT WAR.

SECOND ARTICLE.

Concealment is the next defensive stratagem, and must not be omitted in an account of this kind. Many are the insects, and multifarious are the devices they adopt, which resort to this mode of securing themselves. Those which instantly drop on being touched with the finger, frequently, on reaching the ground, start up, and make at once for some crevice where they may hide. Several beetles cover themselves with sand and mud, so as to be quite undiscoverable by any but those acquainted with their habits. A little black beetle is mentioned which, dwelling upon chalky soils, would become very conspicuous, were it not that it bedaubes its back with chalk, and thus becomes almost invisible. The *cimex* adorns itself with fragments of wool, dust, feathers, silk, &c. and carries its covering about with it; and it is a ludicrous sight to see this creature sometimes drop all its clothes, and come forth nude out of a little heap of odds and ends. There is another, whose operations Kirby and Spence prettily compare to the feat of Hercules after destroying the Nemean monster. This creature kills and devours a large number of the *aphides*, and then covers itself with several of the skins of its victims, and thus the little murderer perpetuates his deadly doings. Many bore into the earth, or take refuge in the stalks and flowers of different plants. Some make themselves coats of leaves, and roll themselves or their larvæ up in them. The caddis-worm, so well known, and eagerly sought after, by the young angler, covers itself with fragments of straw, rushes, and wood. Several spiders surround themselves with earth or gossamer-mesh.

But the most singular of the methods of concealment—I was about to write the most artful—is practised by molluscous animals. The *cephalopoda* have the power of concealing themselves from the eyes of their enemies by darkening the surrounding water. They have a gland for the purpose of secreting a fluid of an intensely deep ink-black colour; and on their being attacked, this liquid is instantly cast forth, and the water becomes obscured for some distance around, so that they effect their escape in the darkness. It is said, though there prevails some doubt upon the subject, that China ink is made from it. Others colour the water of a deep purple; and there is a pretty shell-fish, found in the Mediterranean, known as the *jacintha*, which dyes the water of a splendid violet. There is a small *gasteropod* remarkable for gluing to its shell little pebbles, fragments of shells, and sand, underneath which, like another Atlas, it lies concealed. The *solens*, a testaceous tribe, instantly plunge themselves in the mud on the approach of danger; while the *petricolas*, *lithodomi*, *pholades*, &c. perforate rocks, and obtain a shelter there which their own weak shells cannot afford them. The *Teredo navalis* bores into wood; it is a little creature which, Cuvier tells us, has more than once threatened Holland with ruin by the destruction of its dikes. The eel, loach, cockle, crayfish, &c. defend them-

selves by burrowing in the sand. Many fish muddle the water by stirring it up, and thus hide themselves from their enemies. The burrowing birds are the puffin, and the sand-martin among our more familiar ones. The anxious concealment of the nest, the complicated approaches to it, and its artful construction, especially in warmer countries, must be sought for by the student of natural history if he wishes for a further illustration of the subject. There are many animals which conceal themselves and their young by burrowing in, or under the ground: let me only enumerate the rabbit, badger, and fox. The mole effects his tunnelling by his long trenchant nails, and by means of a little bony process on his long snout. The *tatouay* has an enormous nail for the same purpose, and can earth itself in an incredibly short space of time. There is a curious little crab named the hermit, which, on finding an empty shell, ensconces itself there, and makes it a home.

And now for the *miscellaneous* defences. The simplest of these is velocity of locomotion. It is a mode of escape from danger granted to the weaker members of the animal creation. Insects and birds are thus enabled to fly from a power they were never intended to resist. The swiftness of fishes, such as the trout, mackerel, salmon, and particularly the anomalous provision in the flying-fish, is a further illustration. We are apt to look upon *Crustacea* as a very slow-going race of creatures generally; but the reader will be surprised to learn that there is a species of land-crab, named the *ocypodes*, or swift-footed, which can, and does, when alarmed, run so fast, that it cannot be overtaken by a horse: and some of the *grapsæ*, when attacked, hurry down to the water, making a tremendous noise by their claws striking against one another. If I allude to the swiftness of the horse, deer, and antelope, it is only to suggest to the reader a fuller development of the same feature among animals.

Military stratagems are not uncommon as precautions against dangers. A system of sentinels is often adopted by insects. Wasps and bees place sentinels at night, to pace backwards and forwards before the entrance to the hive; and these little watchers carry their *antennæ* or feelers far extended, as the human sentinel does his musket. If an intruder is detected by the feelers in the attempt to enter, the sentinels instantly fall upon him, making a fearful riot, and so drawing forth some of the slumbering garrison to their assistance; by whose aid the enemy is generally triumphantly despatched, when the reinforcement returns to its rest, and the sentinels resume their post. Every one has heard of, most persons have seen, the sentinel rooks and crows; and the examples of deer, buffaloes, wild horses, asses, and chamois, have become equally familiar. Wild hogs and goats, and other gregarious animals, will frequently, when attacked by wolves, form a circle, placing the defenceless members of the flock in the centre, while the circumference bristles with tusks and horns; and the enemy will rarely venture to attack a resolute band like this. Bees sometimes guard the entrance to their hives from the attacks of the death's-head-moth, by putting up a thick wall of wax, as a castle gate; or, if the apprehended danger is great, sometimes even two, the one within the other. There are some insects, also, which form labyrinths, and ramparts, and bastions, as defences to their cells, and all of the most elaborate and complicated nature.

Electricity is the wonderful weapon wielded by a few creatures. It may possibly be new to some of my readers to learn that there are *electrical insects*. Messrs Kirby and Spence give us, however, an account of an insect called the *wheel bug*, a denizen of the West Indies, which is able to communicate an electric shock by means of its legs. Mr Yarrel, in the 'Transactions of the Entomological Society,' mentions a beetle of the *Elaterida* tribe, which seems to possess a very similar power; and a large hairy caterpillar of South America can likewise administer pretty smart shocks. The electric centipede, *Geophilus electricus*, has the same faculty. The *gymnotus* or electric eel, the *torpedo*, the *silurus*, and a few others, are more generally known to enjoy this distinction. When in the plenary exercise of this astonishing power, one

would conceive these creatures to be next to invincible. The gymnotus is able, by some mysterious agency, to direct the current of electricity whithersoever it wills, so as even to destroy fishes at some distance from itself. Humboldt has given a very spirited account of the only method by which the gymnotus can be taken. The torpedo employs its power chiefly to bewilder its prey.

There can be little doubt that if phosphorescence is in some cases only effectual to betray its possessor, in others it is a safeguard. The fire-fly, lantern-fly, and humble glow-worm may be, and doubtless often are, only glittering baits to some of their dreaded enemies; but it is equally certain that there are others of their foes who fear to attack them, and may be seen running round them half-desirous and half-afraid to do so. An interesting anecdote is related of a combat between a stag-beetle and a glow-worm which demonstrates this. The beetle was seen to be running round and round, tumbling over, and rolling his head in the earth; he had covered himself with some of the phosphorescent matter, and while the glow-worm slowly crept away, its enemy, confused by its own unnatural glare, continued, as it were, chained to the same spot of ground, and endeavouring in vain to rub the luminous matter off. Some creatures defend themselves by intimidation, and will show fight against an enemy however gigantic, either thrusting out their stings, or gnashing their forceps, or expanding their jaws in such a menacing manner, as to make even the stout heart of an entomologist fail. Others rely principally upon some natural, dismal, melancholic, loathsome, or hideous aspect; and to mention the frightful appearance of some of the *Saurians*, will be enough to convince the reader that it must be a bold enemy who will venture to make an onslaught upon them.

The emission of unpleasant odours is the well-known resort of others. There are many beetles which exhale a most offensive, rancid odour; the poplar beetle, in particular, has an apparatus of *eighteen* scent-bags, which, when it is attacked, pour out a milk-like liquid, the smell of which is indescribably suffocating and annoying. All the famous tribe of the polecats, especially the *skunk*, are pre-eminently distinguished for the insupportable stench they can exhale. Nor must I forget the very curious performances of the little bombardier, or *brachinus*. When pursued by its enemy the *calosoma*, it suddenly discharges an explosion of bluish smoke at him, and this seems to surprise the latter so much, that it is some time before he recovers himself. The pursuit renewed, the bombardier fires again, and again, and can discharge its artillery twenty times in succession, making its escape under cover of the smoke. Last of all, I may enumerate the ejection of different fluids as a defence. Many insects, beetles, and ants emit a liquid at their enemies, which is of a powerfully acid or even caustic nature. Some larvae, when touched, bedew themselves all over with a disagreeable liquid. The puss-moth has the remarkable provision of a double syringe, with which it squirts a fluid of a very irritating character at its pursuers.

A few words upon vegetable defences. It is an interesting theme for inquiry, whether the wonderful mimicries of different natural objects serve the vegetable, as in the animal polity, for a defence against the indiscriminate depredation of enemies. For full illustrations, the reader is referred to a paper in a former number of this work.* Whether the remarkable simulations of different insects which occupy the centre of so many of the *Orchideæ*, may have the effect or not of scaring away real insects, the writer cannot undertake to determine. It does not seem improbable. I shall surely be anticipated on the subject of vegetable armour; so that it is not necessary to do more than to call to mind the spines, prickles, stings, thorns, hard envelopes, and husks, which appear to have been given for the protection of different fruits and pleasant flowers. And sometimes there are defences for weaker plants too; for thus a grateful herb,

* Vegetable Mimicry, No. 139.

which would otherwise have been cropped down by the mouth of an animal, is often preserved by growing beneath the arms of some prickly plant, whose sharp weapons repulse the enemy. The odour of vegetables, and flowers in particular, consisting as it generally does of volatile essential oils, which are fatal to insects, may be regarded likewise as a kind of defence. Nor should be forgotten, lastly, those wonderful instances of apparently spontaneous motion, in which the offending insect is either violently hurled off, or crushed to death for his temerity.

I may now conclude; and in doing so, let it be remembered that a mere summary is all this paper pretends to offer—even in that being necessarily imperfect, so great is the richness of the Creator's designs, and such the infinite multitude of self-defensory provisions with which he has endowed the works of his hands. If no mention has been made of the defensory provisions of man, it is because they are chiefly mental; and it is an exalting thought, that by their exercise—the employment of his reason, wisdom, experience, and art—he is constituted lord of creation, and immeasurably superior, both in defensive and offensive resources, to the entire mass of 'the brutes that perish.'

SHUTTING UP OF THE HIGHLAND GLENS.

A VERY large portion of the north-west of Scotland consists of wild mountain tracts, full of picturesque beauty, little intersected by roads, and for the most part many miles distant from any of the Lowland towns. A hundred years ago this Alpine region afforded subsistence to a thinly-scattered Celtic population; but modern improvements have for the most part sent the Highlanders adrift, and many of them have found a home in Canada, where they are infinitely more comfortable than in the sterile glens of their forefathers. In the place of a human, a sheep population has been generally introduced into the Highlands; and where this is found not to pay—that being the great thing now-a-days—a population of deer, grouse, blackcock, and other game has been cultivated, for the sake of autumnal sportsmen. An English or Scottish Lowland estate usually consists of a few thousand acres, laid out in well-fenced fields. A Highland estate extends probably over twenty miles of country, and includes many tall frowning hills, deep valleys and ravines, lakes, waterfalls, and brown heathy moors—the whole unenclosed, and lying pretty much in the condition it has done ever since the creation. In the old times, these wastes were the domain of the chiefs of clans—Macdonnells, Macleods, Macgregors, Mackays, Grants, and so forth. In some cases, descendants of these heroes still possess and draw a rental from them; and in others they have passed, by purchase or inheritance, into the hands of English noblemen and gentlemen. There has latterly been something like a mania among Englishmen for buying Highland properties; and if it continue much longer, the lairds of the old stock will be as much adrift as their expatriated clansmen.

The cause of the odd-looking mania to which we refer is a love of 'sport;' for which, as is well known, Englishmen will go great lengths, and do very mad things. Satiated with shooting pheasants and other half-civilised game in English preserves, and longing for novelty, off set troops of wealthy southerners to buy, or at least rent, Highland estates, where battues can be carried on upon a great and enlivening scale. Such old Highland lairds as still call their estates their own, are usually glad to have dealings with these wanderers—at least their Edinburgh agents are—and bargains are made of a kind which would very much astonish the Fergus M'Ivors of former days. It is stated that in Perthshire alone shootings are let to the extent of L.10,000 annually, and altogether the money squandered every year on game rents in the Highlands is probably L.40,000. While this traffic is gratifying to

the lairds, it is equally satisfactory to the scattered sheep farmers and hangers-on of the wilderness; for they contrive to pick up considerable sums of money from the sportsmen-tenants for petty services and provisions. With all this, however, no one can find any fault, and it is only to be lamented that a number of these settlers from the south so conduct themselves, as to render their tenancies a nuisance to the country. Their insatiable and selfish love of sport is the source of the disquietude. Accustomed to consider a park or woodland preserve as a tabooed district, into which no unauthorised visitant shall set his foot, the renter of the Highland domain imagines that his wild mountains and moors should be equally sacred from intrusion. The fancy of shutting up vast tracts of country from the tourist and pedestrian—tracts without a house, tree, or bush for miles, and which even, when bounded by the common road, are altogether without fences—seems to the Scotch generally a very unjustifiable stretch of territorial title. Yet this is done on the plea of sport—the necessity of not disturbing the game. This word sport requires a little qualification: it is employed to cover a good deal of sound business. When shootings are taken at a pretty high rent, it would appear to be deemed necessary that they turn out fair speculations in a commercial sense. On reaching the clachan or village, near which are situated the quarters of the principal 'sportsmen,' the tourist need not be surprised to see an establishment for making deal boxes, and transmitting them full of game to the London market. Sent down the country by cart, gig, or stage-coach, these boxes are shipped at Dundee, Aberdeen, or Inverness, by steamer to the metropolis; and they may be known at once for what they are, by their direction on the lid to certain game butchers at the 'west end.' The traffic of this nature is now becoming a rival to that of the ordinary 'dead meat' freights. The London shops, in short, are now supplied with game by noblemen in the same way that they are supplied with meat by carcass butchers. To help them to kill for their customers, the sportsmen-tenants invite numbers of young noblemen, foreign dukes, military officers, and others, to enjoy a few days' or weeks' shooting; and the Highlands, accordingly, swarm with these visitants in the latter months of the year.

It will be observed that this is a different thing from the old-fashioned and gentlemanly Highland way of conducting field-sports, by which a few acquaintances are collected on the 12th of August at a shooting-box, and a number of pairs of grouse are despatched as presents to friends. Neither is it exactly the modern deer-stalking, in which patience and a high degree of skill are concerned: it is very much a wholesale system of slaughtering, like that of the battues in southern preserves, it being a main object to kill a certain quantity of animals, if not for the glory of killing, at all events for the sake of the cash the animals are worth. Be this, however, as it may, we should not be inclined to speak disparagingly of the practice, were it not fruitful of certain unpleasant consequences. Let the noble lessees in question fire away, kill, and sell as long as they have a mind. All that we and others care about, is their attempting to exclude the very harmless order of tourists and scene hunters, who frequent the Highlands, from walking about to see waterfalls and precipices, from taking short cuts across the hills, or from visiting the loftiest and grandest of the Alpine peaks. So many cases of this kind have lately occurred, that it has excited the indignation of the Lowland Scotch in no small degree. We are sorry for this. We desire to see Englishmen respected and rendered happy in Scotland, and detest all sorts of national jealousies. The new settlers, however, are clearly in the wrong; and they, as well as the native noblemen who imitate them in their exclusiveness, must hasten to recall their orders. There is no law of trespass in Scotland, as far as regards unenclosed lands. A person may walk to the top of an open hill, or across an open moor, subject to no other

legal restraint than an action of damages. And to lead evidence of injury done to a peat-moss, or a bleak hill-side, would be somewhat troublesome. Of course, if a traveller seriously disturb sheep, that is a different matter. But who in his senses does so? We see that some of the Scottish newspapers recommend pedestrians in the Highlands not to turn back when ordered; but to leave the sportsmen-tenants to prosecute—which they will not do. The magazines, too, consider forcible exclusion to be unjustifiable. Blackwood remarks as follows:—'We have observed with great pain that a far too exclusive spirit has of late manifested itself in certain high places, and among persons whom we regard too much to be wholly indifferent to their conduct. This very summer the public press has been indignant in its denunciation of the Dukes of Athole and Leeds—the one having, as it is alleged, attempted to shut up a servitude road through Glen Tilt, and the other established a cordon for many miles around the skirts of Ben Macdhui, our highest Scottish mountain. We are not fully acquainted with the particulars; but from what we have heard, it would appear that this wholesale exclusion from a vast tract of territory is intended to secure the solitude of two deer-forests. Now, we are not going to argue the matter upon legal grounds, although, knowing something of law, we have a shrewd suspicion that both noble lords are in utter misconception of their rights, and are usurping a sovereignty which is not to be found in their charters, and which was never claimed or exercised even by the Scottish kings. But the churlishness of the step is undeniable, and we cannot but hope that it has proceeded far more from thoughtlessness than from intention. The day has been when any clansman, or even any stranger, might have taken a deer from the forest, a tree from the hill, or a salmon from the river, without leave asked or obtained; and though that state of society has long since passed away, we never till now have heard that the free air of the mountains, and their heather ranges, are not open to him who seeks them. Is it indeed come to this, that in bonny Scotland the tourist, the botanist, or the painter, is to be debarred from visiting the loveliest spots which nature ever planted in the heart of a wilderness, on pretence that he disturbs the deer? In a few years we suppose Ben Lomond will be preserved, and the summit of Ben Nevis remain as unvisited by the foot of the traveller as the icy peak of the Jungfrau. Not so, assuredly, would have acted the race of Tullibardine of yore. Royal were their hunting gatherings, and magnificent the driving of the Tinchel; but over all their large territory of Athole the stranger might have wandered unquestioned, except to know if he required hospitality. It is not now that the gate is shut, but the moor; and that not against the depredator, but against the peaceful wayfaring man. Nor can we, as sportsmen, admit even the relevancy of the reasons which have been assigned for this wholesale exclusion. We are convinced that in each season not above thirty or forty tourists essay the ascent of Ben Macdhui, and of that number, in all probability, not one has either met or startled a red-deer. Very few men would venture to strike out a devious path for themselves over the mountains near Loch Aven, which, in fact, constitute the wildest district of the island. Nothing but enthusiasm will carry a man through the intricacies of Glen Lui, the property of Lord Fife, to whom it was granted at no very distant period of time out of the forfeited Mar estates, and which is presently rented by the Duke of Leeds; and nothing more absurd can be supposed, than that the entry of a single wanderer into that immense domain can have the effect of scaring the deer from the limits of so large a range. This is an absurd and empty excuse, as every deer-stalker must know. A stag is not so easily frightened, nor will he fly the country from terror at the apparition of the Cockney. For a few moments he will regard the Doudney-clad wanderer of the wilds, not in fear, but in surprise; and

then snuffing the air, which conveys to his nostrils an unaccustomed flavour of bergamot and lavender, he will trot away over the shoulder of the hill, move further up the nearest corrie, and in a quarter of an hour will be lying down amidst his hinds in the thick brackens that border the course of the lonely burn.

'We could say a great deal more upon this subject, but we hope that expansion is unnecessary. Throughout all Europe, the right of passage over waste and uncultivated land, where there never were, and never can be enclosures, appears to be universally conceded. What would his Grace of Leeds say, if he were told that the Bernese Alps were shut up, and the liberty of crossing them denied, because some Swiss seigneur had taken it into his head to establish a *chamois preserve*? The idea of preserving deer in the way now attempted is completely modern, and we hope will be immediately abandoned. It must not, for the sake of our country, be said that in Scotland not only the enclosures, but the wilds and the mountains, are shut out from the foot of man; and that where no highway exists, he is debarred from the privilege of the heather. Whatever may be the abstract legal rights of the aristocracy, we protest against the policy and propriety of a system which would leave Ben Cruachan to the eagles, and render Loch Ericht and Loch Aven as inaccessible as those mighty lakes which are said to exist in Central Africa, somewhere about the sources of the Niger.'

Referring to the same subject, a writer in *Tait's Magazine* makes a remark, with which we conclude. 'If any bill, perhaps in the form of an act, "to interpret" some game act, should be brought in to extend the law of trespass to such new exigencies, we hope the public will be on their guard to defeat it.'

ANATOMY OF VAGRANCY.

In a recent number, we gave an account of a class of the people destitute of all regular means of living, and yet not necessarily dishonest.* We now propose to lay before our readers a general view of the various tribes of more formidable vagabonds, who, whether working separately or in concert, devote themselves to distinct branches of their unrighteous profession. This body of information, we ought to say, is mainly the contribution of a gentleman whose official functions have laid open to him peculiar sources of knowledge.

The dishonest classes are chiefly found among the lower classes; partly because education is not so general among these, but principally for the simple reason that they form the great mass of the people. It must be observed also that the crimes of the higher orders are frequently of a kind which cannot be reached by the law, as it exists at present; although it would be absurd to suppose that this is the consequence of any feeling of partiality. The victims of such crimes are not the poor, but persons in the same rank as the criminal, who are as unwilling to be fleeced as any other portion of the community. The notorious Joseph Ady, for instance, preys exclusively upon his own middle rank, and disdains any booty that does not amount to a pound sterling. A survey of the affairs of the 'gentle-tee' would be highly curious; and if sufficient materials come in our way, we shall not be disinclined to undertake it. At present, however, our plan requires us to be satisfied with a single glance at the Corinthian capital of crime.

Marriage is a grand engine of the high-class sharpers, and is resorted to when all ordinary means of 'living by their wits' have failed.† Some of these are well born

and well educated, but have passed their lives in discreditable or dangerous expedients, rather than apply to honourable industry. They at length either find their family of sons (idle, of course, like themselves) an intolerable burthen, or else, in the failure of their usual resources, they are driven to look to them for assistance. The emergency is critical. They are no longer at a time of life when they can take the world as it comes; and they determine upon a *coup d'état*. Some unceremoniously 'assume a "title," if they have it not;' but others take the trouble of seeking out a certain colour for the assumption in family history. Among the extinct titles formerly annexed to the surname they really possess, or have thought fit to adopt, there is one to which no property is attached; and their claim to this barren honour being undisputed, it is gladly recognised in the proper quarters—on their paying the fees. My lord now hurries to London, with the honourable mister, his eldest son; and by means of a careful inspection of the wills in Doctors' Commons (which costs them only a shilling each time), they have little difficulty in discovering some wealthy heiress. The addresses of an honourable, backed by a baron, are irresistible; the lady does not presume to verify so ancient a rent-roll; and presently her hand and fortune become the prey of the noble swindler and his harpy family. In this case the title acts in the same way as the lying rags of a humbler class of impostors. To one, the heiress gives a tear and a shilling—to the other, a smile and her all.

But the high-flyer has other resources besides marriage; for his honourable title—frequently his own by right—is capable of duping more than heiresses. The history of the late railway mania would afford many curious instances of the 'magic of a name.' A scheme, however wildly absurd, required nothing more than a well-sounding list of chairmen and provincial committeemen: lords, baronets, esquires, F.R.S.'s, A double S's—'captains and colonels, and knights-at-arms.' It did not need even the ingenuity of the begging-letter convector; for it was not the document that was looked to, but the titles that adorned it; not the feasibility of the falsehood, but the appearance of the impostor. All this, however, has worked for good, and society thrives on the ruin of its simpler members. A railway project now would require more than 'honourable' projectors; and in like manner a thief in a draper's shop no longer escapes suspicion or arrest because she is a 'lady.'

Passing over for the present the gamester, and other congenial tribes, we shall descend at once to find a counterpart of the vices of the upper classes among the poor, with whom the cause of dishonesty is frequently the very same—a disinclination to regular industry, although its excuse may be greater, in the more immediate pressure of want, and the results of a neglected or wholly omitted education. Vagrancy has two classes, higher and lower, and the members of the former are technically distinguished as 'silver beggars.*' They are well-dressed, clean, and respectable-looking. They resort to no clamour—no demonstrations of distress; but, on the contrary, are quiet, unassuming, nay, retiring. Their melancholy story is contained in a brief, authenticated by the signature of clergymen and magistrates, and, when necessary, by that of a consul at some foreign port. You are welcome to read it, for that will

* The Supernumerary Class, *Journal*, No. 157.

† Crime reduces all rogues to a level. Each class has its own professional name, which we shall give as a curiosity, only confin-

ing it to its due place—the bottom of the page. The worthy now alluded to is called by his brother vagabonds the 'knowing cove,' and 'gentleman high-flyer.'

* In the rogue's language they are 'lurkers.'

do you no harm. You may relieve them if you will. If you do, they will be grateful, but not servile; and if you do not, you need not fear their reproaches. God help them, they are too much accustomed to disappointment for that! They are aware of the many appeals that must be made to your kindly nature; for this is a bitter world—a bitter, bitter world—and for themselves they are nobody, they are strangers, and alone. Surely you cannot stand that! If you do, you relent before the man is round the corner. We have known an apoplectic servant grow black in the face with running after a silver beggar with a shilling.

One of these unfortunates has been persecuted by fire—it may be for twenty years at a stretch. He has been burnt out of house and home, as you may see by the testimony of more than one magistrate: the devouring element paying not the slightest regard even to the respectability of his character, vouched for though it be by several clergymen. But, fortunately for the victim of this chronic conflagration, there are still humane and charitable persons in the world; and he is proud to carry a book in which their names are registered. Some are down for a donation of L.5, while others could afford only L.3, or L.2, or L.1. Nay, there are modest signatures which descend so low as to ten shillings or half-a-crown: you may choose which example your pride or your circumstances will. This is a lucrative branch of the profession, and clever practitioners have been known to realise handsome incomes for a long series of years.

Water is another great persecutor of artists of this description; but, like fire, it eventually enriches the victim it has ruined. He appears in the likeness of 'a rude and boisterous captain of the sea,' whose animal spirits have been depressed by misfortune; and this result is not wonderful, since his whole property, and his whole crew, all but one man, have been swallowed up by the relentless waves. The catastrophe took place somewhere abroad, as is shown by a certificate from one of our foreign consuls, and likewise by an order from the same functionary providing the two survivors with funds or a free passage to Cork or Liverpool; for to one or other of these ports it is always their pleasure to be conveyed. There is also another certificate, old and well-worn in appearance, though probably just out of the manufacturer's hands, beginning 'Port of Liverpool to wit,' and signed by two magistrates, with the signature and seal of the consul in the corner; but to make assurance doubly sure, the unfortunate captain has still round his neck the identical gold chain he happened to wear at the moment of his shipwreck. These captains are never less than fifty in number; and being men of education and address—originally either supercargoes or lawyers' clerks discharged for drunkenness—they make a snug little income of some L.300 per annum each.

Next to these old sea-dogs, we may place the tribe of distressed foreigners who apply to the sympathies of British hearts.* Not that these gentry are always natives of other countries (which, indeed, is the exception rather than the rule), but they are dressed, complexioned, mustached, and imperialised to such an extent, that their own mothers would not know them from Frenchmen, Spaniards, or Poles. In fact the English foreigner is more foreign than the real foreigner, inasmuch as, in addition to the hair on his upper lip, he wears the tuft on the chin, called an imperial, which you rarely see abroad. These personages have been compromised by mixing too freely in the political squabbles of the country they honour by adopting. Some have been loyalists where loyalty has gone to the wall, and others liberals where tyranny has triumphed; but all are victims of one kind or other, and have selected for a place of refuge that noble country which is of all parties, and has money for all comers. The true refugee may be detected by his proud impatience of charity, and his

anxiety to help himself by tuition or other employments fit for a gentleman; but the vagrant scorns every kind of industry but beggary and imposture. This has placed mustaches and imperials in such unamiable odour, that strangers wearing these decorations fall *ipso facto* under the surveillance of the detective police; and in the great towns, the landladies of furnished apartments, whom they used to terrify on account of their daughters' hearts, are now much more uneasy on the score of their silver spoons. Still this 'commodity of hair' is convenient, as a clip of the scissors metamorphoses the whole man; and the noble foreigner being above carrying certificates and a subscription book, his detection is difficult. These persons have often a military air, having deserted from, or been turned out of, the army; and they can make themselves extremely agreeable in society wherever singing, waltzing, polkaing, and galloping are in request. This branch of the profession is followed likewise by the fair sex. The female foreigner in distress was originally, in all probability, an English waiting-maid, who married a soldier, went abroad, and picked up language and manner, and who has now returned to live upon her personal, family, and patriotic distresses. She would live much better were it not that the habitual depression consequent on her misfortunes has seduced her into the practice of dram-drinking.

Occasionally, instead of English foreigners preying upon their countrymen at home, our home vagrants betake themselves to foreign travel. A woman known by the name of Meg, who was at Manchester not long ago, and is probably there still, affords a remarkable instance of this. She was born in the middle class, and after her mother's death, was sent to a boarding-school, where she remained till she was seventeen. At this time she suddenly received a letter from her father, informing her that he was now married, which he had never been before, and that the new claims upon his income rendered it imperative upon her to provide for her own support. Meg, strange as it may appear, immediately made her election, and went forth into the world a beggar and impostor. She travelled over a great part of Europe, remaining some time at Rome, and acquired several languages, and picked up a considerable stock of information. Her taste, however, as well as her profession, led her to study the economy of the communities of beggars in the various countries she traversed, and she at length returned to England to practise the lessons she had learned on the continent. In Manchester, when we last heard of her, she was well known to the mendicity officers, and was supposed to be quite independent, occupying a genteel sitting-room and bed-room in a remote corner of the town. From this place, though impelled by no want, she sallied forth regularly to haunt with other beggars, and play off her impostures in damp cellars, and by means of hired children.

We are now rapidly descending in point of rank, and find the lower classes of vagrants, as might be expected, the great majority. The next we summon for review are those who live upon the losses they have sustained in their passage

Thorough brake, thorough brier,
Thorough muck, thorough mire,
Thorough water, thorough fire.

They depend, in short, upon the chapter of accidents,* and are provided with certificates from magistrates and books of subscription. Floods, storms, and murrains are common calamities of these unfortunates. Some have seen their horse, their only support, drop down dead; and some have been ruined by the too great liveliness of the same animal, which overturned their crockery cart, their only property. If women, their husbands were killed on a railway or in a coal-pit. Their children accompany them, as living evidences of their poverty; and although children have the practice of growing up,

* The foreigner's lark.

* The accident lark.

and taking to the accident line on their own account, they can always borrow as many as they want at the cost of sixpence a-day per head. When the inquiries of the compassionate are too embarrassing, they decamp to the next large town, where they are sure of obtaining two nights' lodging gratuitously in the night-asylum; but after this they must resort to the trampers' lodging-house, where the accommodation costs twopence per night. Thus they traverse the whole kingdom, a circulating medium of fraud and beggary, and are always successful, because their faces, if not their stories, are always new.

A more ingenious portion of the same class* figure as sailors or colliers; the one having had his ship struck with lightning in the West Indies, and the other having been blown up with fire-damp in a coal-pit. Some blister salve applied to the arms gives one of the artists all the advantage of a dreadful scald, while his comrade looks wonderfully ghastly by the aid of nothing more than a white linen band across the forehead. Another unfortunate is still more afflicted in the arms, though at less cost of suffering. He stains them with some substance which gives them every appearance of inflammation, and bandages up his fingers towards the wrist with dirty rags. This, you will say, is not much; but the wretch has all the time a piece of fat in his closed hand, which, oozing out, as it melts, through the bandage, makes the stoutest stomach sick, and the hardest head sore. The diseased arms hang helplessly down, but there is an open pouch pinned to the clothes, into which, turning away your head, you make haste to drop your charity. These fellows travel in groups of two or three, and their average gains may be about ten shillings a-day.

Fits, occurring conveniently near the door of a house, are so common, that we must not do more than allude to them. They usually extort a glass of wine, as well as food and money; but it is said that a spoonful of salt stuffed into the mouth is quite a magical cure. Women of this class beg baby-linen, flannel, or calico; and their appearance is such, that the benevolent make haste to comply, thinking the application a little too long deferred. Their husbands are either at home, confined to bed through severe illness, or they were killed six weeks before, in the course of their labours as navigators, colliers, or sailors. Some vagrants are deaf and dumb, and are *therefore* supposed to be able to tell fortunes, communicating with their customers by means of a slate and pencil. They have before now been cured of this affliction, by some humane person proposing (they, of course, being unconscious of the conversation) to stick them a little with a knife in the back of the neck, a plan which the extempore surgeon heard mentioned as a wonderful restorative of the faculties of speech and hearing. While this business is discussed, the deaf and dumb is anxious and observant; but when at length he sees the gentleman step furtively behind him, with a knife gleaming from his sleeve, he gives a hullo! that alarms the very operator, and bolts out of the house.

Servants are imposed upon by servants out of place, who have lost their situations through illness, and have been left no clothes by their misfortunes but the neat thin dress they wear. Counterfeit weavers, cotton-spinners, and calenderers go singing about the streets in parties, accompanied by a woman, who sells cotton to the charitable at 150 per cent. profit. Others leave printed bills at the houses, stating how their factories have been burnt down, and adding that the bill will be called for, and the merest trifle gratefully accepted. The labours of such classes end when the sun sets, and the day's earnings are then spent in mirth and riot—which of course makes them all the more profitably dismal and sickly-looking for the morrow.

Begging-Letter Writing is a distinct trade in all the large towns, where the scribe charges from five to ten

shillings for each production. Notwithstanding this handsome payment, however, there is little variety of genius exhibited, the letters usually proceeding in the same form—as thus: 'Sir, or Madam—Hearing of your well-known benevolence, &c. and having lost my all, &c. and having a wife and five helpless children entirely dependent on me for support, and I myself suffering from a grievous and internal disease, &c.' This is a numerous and invariably drunken class.

The shipwrecked sailors choose cold, rainy, and stormy weather for their peregrinations, when they go in groups, bawling their songs through the streets, half naked, and shivering in the blast. They have lost their all, it seems, and only saved their lives by swimming ashore. One of the gang, who is the spokesman, is a real sailor; but if you ask any of the others, as if by way of trying him, 'whether the timbrel is on the larboard or starboard side of a lugger,' he will betray, by attempting to flounder through an explanation, that he is unconscious of the imaginary nature of the article named. What these naked wretches seek is old apparel, which they sell to the people who are constantly advertising for cast-off clothes.

We close our catalogue with the cadgers, who, with the exception of a few who pretend to sell matches, make no excuse at all, but are genuine sturdy beggars, who depend upon your charity, and anything they can help themselves to at your back-doors or upon your hedges. An infallible way to secure exemption from the visits of cadgers, would be to keep a single little heap of stones before your door, ready to be broken by them at the rate of sixpence per hour. There is a free-masonry throughout the craft, and your house would soon enjoy a general taboo. An Irish gentleman effected the same purpose by having a machine at his gate, with a notice thereon that any person who chose, by turning the handle for one hour, would grind himself out three-pence.

Some cadgers sit in the street, writing and sketching with chalk in a beautiful style;* proving by this very accomplishment their ability to find regular employment if they desired it. Others sit on the footpath at the entrance of a town with a label stuck on their breasts.† But perhaps the most melancholy crew in the whole catalogue are those who have been really ignorant all their lives of every kind of employment but theft and beggary. They are the children of vagrants, as well as vagrants themselves; they have passed most of their time in jail; and they have all a peculiarity in their expression, by which the experienced distinguish them at a glance.

Such are the vagrants of this country; and it will be seen that they form a class hardly second to any in ingenuity, perseverance, hardihood—everything, in short, which is requisite to enable individuals to gain a comfortable subsistence—but honesty. Seventy-two thousand persons in Scotland alone are almost entirely supported by private charity; but the fund is distributed in such a manner, that charity itself becomes a curse. It is a premium to dishonest ingenuity; it tempts poverty into crime; and swells the amount of vagrancy by the very act which is intended to diminish it. Do we then propose to limit private charity? God forbid! It is far too limited already, and we would fain multiply it tenfold. We would merely distinguish between fraud and destitution; we would have the humane bethink themselves that, in pampering vagabonds, they starve the honest poor. If they will not take the trouble of investigating cases themselves, there are almost everywhere societies that will do so for them; and it should be considered that investigation is a *favour* conferred upon the honest applicant, for which he will be devoutly grateful. Because we are merciful to the unfortunate, we would have no mercy on pretenders. When the latter extract money from the rich, they really prey upon the poor; and, in the case of dis-

* The sick lurk.

* Cadger screeving.

† Cadgers' sitting pad.

covery, which of course must be frequent, by imbuing the classes capable of affording relief with suspicion and ill-will, they render the position of the really destitute hopeless. If our description of vagrancy is read in a right spirit, it will induce, as well as enable, the charitable to distinguish between the fraudulent and the unfortunate; and it will rouse their warmest sympathies in behalf of those classes of the poor that are pressed down into starvation by the crimes of the poor themselves.

JOSE JUAN, THE PEARL DIVER.

A few years before the states of South America threw off the Spanish yoke, I was staying one hot summer at San Blas, situated at the entrance of the Gulf of California. It was then the entrepôt of the flourishing commerce of Spain with the islands of the Southern Ocean, with China, and the East. A busy population filled the streets, and ships from all parts of the world crowded the roadstead; on the border of which there now remain but the ruins of arsenals and dockyards. San Blas retains only the remembrance of her former activity and her picturesque situation.

So stifling was the heat of the city, aggravated by the myriads of mosquitos that infested the air, that I was glad to escape on an errand of business to a place some distance up the coast; and engaged a passage on board the galliot Guadaloupe, a small vessel of fifty-eight tons burden. The captain desired me to take a lodging near the shore, as he might have to sail unexpectedly, and could not afford to lose time. After waiting three days, a canoe was sent for me to the landing-place, and in a few minutes I stepped on board. The deck was covered with heaps of the enormous and savoury onions for which San Blas is celebrated, mingled with gourds and bananas. This collection of fruits and vegetables formed, with my trunk, nearly the whole of the cargo. Our preparations were soon made, the onions were stowed away in the three canoes which we carried, the clustering bananas were hung up like long fringes on the starboard and larboard bulwarks, and then the vessel was abandoned to the discretion of the winds and the waves.

The crew was not less singularly composed than the cargo. Our Catalonian captain, Don Ramon Pauquinot, had under his orders a French sailor, deserter from a whale ship; a Mexican, who pretended to act as second mate; a Kanaka, or native of the Sandwich Islands; a Chinese, alike unwilling to cook or to work; and lastly, two young Indians, from one of the tribes in the interior of the country, in the capacity of cabin-boys. The captain, when he was not quarrelling with his sailors, passed his time in pacing up and down the deck, smoking and examining his store of gourds and onions. The Frenchman took upon himself the office of steering, and looked with contempt on all other persons in the vessel. The Mexican lay idle all day long in one of the canoes, strumming upon a guitar, and affecting to be highly indignant if the captain presumed to give him any orders. The Chinese, pretending to be busy either with cooking or the ordinary ship's duty, did neither one nor the other. The Kanaka was the only one who really worked; he cooked the rice, bananas, and *cecina* or dried meat, which alone constituted our fare.

We had been out fifteen days, and were yet far from our port: the water putrefied in our casks under the burning rays of a vertical sun; the *cecina* and rice were unendurable; when one evening, as the sun was disappearing behind a fog bank on the distant horizon, the Frenchman beckoned to me, and on my obeying the signal, he said, 'Look yonder; we are approaching the Isle of Cerralbo; and behind is that of Espiritu-Santo.'

On my inquiring what we were to think of it, he replied, that although the captain yet considered himself sixty leagues from Pichilingue, we were in reality that distance beyond it, making an error of one hundred

and twenty leagues in a voyage of little more than double that length. When the captain was informed of his blunder, he said to me, 'Lucky 'tis no worse, or I should have to keep you longer; but never mind, everything is included in the passage-money, and after resting a little at Cerralbo, I will carry you back to Pichilingue.'

By the time we were near the islands the sun had disappeared: we could just distinguish the huts forming the temporary habitations of the population, when, amid loud outcries from the shore, two canoes, with a man in each, one of which seemed to be pursuing the other, were seen rapidly skimming across the channel which separates the two islands. The attention of our whole company, particularly that of the Indians, who looked on with intense delight, was at once absorbed in the interest of the chase. The captain took his telescope, and after gazing a few minutes, said, turning to me, 'He is lost!'

'Who?' I inquired.

'Who? the man yonder in the canoe trying to get away.'

'What makes you think so?'

'Jose Juan is in pursuit,' was his answer.

The mention of the name left me no wiser; and considering it useless to trouble the captain with further questions, I continued to watch the canoes. It was evident that the fugitive was trying to gain a little creek among the rocks stretching out from Espiritu-Santo. It was the only place where he could reach the shore. In spite of all his efforts, an adverse eddy prevented his making way, while Juan, who was farther out, rapidly approached to cut him off from his retreat. The man in the foremost canoe, despairing of escape, rose to his feet, and when his pursuer was within a few feet of him, plunged into the sea. Juan immediately stood up, and seizing in one hand the line used by pearl divers, leaped in after him. A minute had scarcely elapsed, when a head appeared above the surface of the water; it was that of the fugitive swimming towards the shore with all the energy of despair. All at once, as though he had been carried down by a whirlpool, he disappeared. A thin white foam, caused by the boiling of little waves above the place where he had sunk, indicated that a struggle was going on below. Was it between Jose and his adversary, or with one of the ferocious sharks which abound on the fishing-grounds? The spectators, however, were reassured by seeing that the foam showed no stains of blood; and soon after two heads appeared—Jose Juan and the fugitive. But it was at once seen that the latter supported himself on the surface of the water by the action of his legs only, for his arms were lashed close to his sides by Juan's cord. This marvellous feat, accomplished under the water, produced a shout of acclamation from every spectator, intermingled with cries of *Viva Jose Juan*.

The rapid approach of night hid the remainder of the scene from our eyes; at the expiration of a few minutes, however, we heard loud lamentations on the shore, accompanied with ironical bursts of laughter, and the confused noise of a struggle between one man and a number of others; after which all was still. We subsequently learned that the fugitive was a diver, who had stolen and swallowed a large pearl; for the losses thus sustained, the leaders or captains of the various parties are responsible. Juan was one of these captains; and as usual, when he had got his man on shore, made him swallow a dose of turtle-oil, which causing him instantly to vomit, the pearl was recovered.

The morning after our arrival, at the captain's suggestion, I went on shore, where I met our Mexican, who communicated to me some particulars of the life of Jose Juan, in whom I began to feel much interested: among others, of his having once attacked and killed a shark, which had devoured a fellow-diver, his intimate friend. I had been at a loss, while walking about among the miserable dwellings, where to apply for a night's lodging; but now my mind was made up at once to go to

Juan's hut, and request the owner's hospitality. The diver, who was a *metis*, as those are called born of an Indian father and white mother, received me courteously, and led me to his dwelling, situated some distance beyond the others, almost at the extremity of the island of Cerralbo. On our entrance, we found his young wife preparing the dinner, which consisted of a turtle, whose lower shell was torn off, simmering in its fat on a fire of glowing embers. I produced a bottle of excellent wine which I had brought with me, and seated on the ground, we enjoyed our meal. Night came on; the stars shone through the open door of the hut; the sea rippled softly on the shore, when, unable longer to restrain my curiosity, I begged Juan to tell me of his adventure with the shark. No sooner had I spoken, than a mortal pallor overspread the features of his wife; she looked with a supplicating glance at her husband, who with an impatient gesture motioned her away. When she disappeared, an expression of savage pride lit up Juan's features; pouring out another glass of wine, he said, 'I never felt more disposed for confidence. You said you would depart to-morrow?'

'To-morrow at daybreak,' was my answer.

'Tis well,' rejoined the diver; 'you shall know my history,' and he rose and beckoned me to follow him. When we were out of the hut, he added, 'The land-breeze blows as usual; and to-morrow by ten o'clock, when it will cease, the Guadalupe will be far away.'

He then seated himself on the bottom of an inverted canoe, and recommenced:—'At the beginning of last year's fishing season there was one man that I met everywhere. Like me, he was a diver; and, like me, pretended to have no family name. He was called Rafael. At the washing, under the water, in all quarters, in fact, we were sure to meet. These frequent opportunities of seeing each other made us very friendly; and the remarkable skill with which he performed all his avocations inspired me with a great esteem for him. His courage was quite equal to his skill: he had no fear whatever of sharks; he had, he told me, a particular manner of looking at them which intimidated them; he was, in short, an intrepid diver, an excellent worker, and, above all, a merry companion.'

'This went on very well, until one day a young girl came with her mother to live in the island of Espiritu-Santo. Some business that I had there with one of the dealers gave me the opportunity of seeing her. I became passionately in love; and enjoying a certain reputation, neither she nor her mother looked with an unfavourable eye on my pretensions and presents. As soon as our day's work was over, and every one thought me asleep in my hut, I went across in a canoe to Espiritu-Santo, whence I returned soon after midnight without any one suspecting my absence.'

'Some days had passed after my first nocturnal excursion, when one morning, going to the fishing-ground before sunrise, I met one of our old Indian women, who accosted me with the words—"Listen, Jose Juan; I have something to say that concerns you." She then went on, much to my surprise, to tell me that I had a rival, Rafael, one of our divers, who threatened to do me an injury. That evening I discovered that she spoke truth, and that Rafael was actually swimming in the same direction as myself. All at once a wild cry burst across the waters. There was no mistake; it was Rafael's voice.' Here Juan sighed deeply as he continued—'I knew that Rafael was my enemy, and that he aimed at taking from me her whom I desired to make my wife; I knew likewise that his vengeance was deadly. But this was not a time for me to weigh feelings of selfishness. It was a gloomy night, and a wailing voice came across the waves. Turning my canoe in the direction whence the sounds proceeded, I heard vigorous blows on the water, and rowing in the direction of the noise, saw Rafael in the midst of a circle of foam. It struck me as strange that, instead of using his strength to swim towards the canoe, he remained struggling in one spot. But I soon became aware of the cause: a

short distance from him, and a few feet below the surface, shone a phosphoric light, approaching slowly nearer and nearer to him. Can you guess what it was?'

'No.'

'It was a tintorera, a shark of the most voracious species,' answered Juan, and continued his narration. 'A stroke of my paddle brought me close to Rafael: on seeing me he uttered a cry of joy, but had not strength to speak. With a desperate effort he seized the gunwale of the canoe; yet such was his exhaustion, that he could not raise himself from the water. His eyes, though deadened by terror, looked at me with an imploring expression of agony so intense, that I grasped his two hands in mine, and held them fast. The streak of light under the water came steadily on; for one instant, one brief instant, Rafael ceased to strike out with his legs; a fearful shriek burst from his lips, his eyes closed, and his hands relaxed their hold. The upper portion of his body fell back into the sea: the shark had cut him in two.'

The diver paused in a struggle of inexpressible emotion. In reply to my inquiry, he said that, had he been a little more collected, he might possibly have saved his companion; his teeth were set, and his voice resembled a hoarse whisper. Recovering himself, however—I have not yet come to the end,' he said: 'no sooner had Rafael's body disappeared under the water, than I plunged in myself. I had a hundred reasons for so doing. The tintorera, although he had rid me of a rival, became hateful to me, and exasperated me by the brutality with which he had torn poor Rafael to pieces. The honour of the corporation of divers was insulted: I am, you know, one of the captains. Besides, once enticed with the taste of human flesh, the monster would have come to attack us next. And how could the alcalde expect me to be responsible for my friend, if I killed the shark that had eaten him?'

'I did not go deep, as you may think; having to look above, below, and around me all at once. The waves roared over my head with a noise like distant thunder, but around me all was calm: a dark mass drifted against me: it was the mutilated trunk of Rafael; and I concluded the fish I was looking for could not be far off. In fact, a distant ray of light, at first scarcely visible, grew more and more distinct. The tintorera was about the same depth as myself, but gradually slanting upwards. My breath was beginning to fail; I did not wish to give the shark the advantage of being above me. I rose to the surface: it was time; for so swiftly did the monster approach, that his fins brushed my body as he passed; and I could see his dull glassy eyes, and the rage of flesh yet hanging to his jaws, which he smacked together with greedy satisfaction. I snorted rather than breathed when my head rose above the water. The shark was close behind me, his silver white belly plainly visible as he turned on his back, at the same time opening his tremendous jaws, bristling with frightful rows of teeth. Darting away in the opposite direction, I buried my dagger in the body of the fish, and cut a gash as far as my arm could reach. The tintorera, wounded to death, dashed upwards with a prodigious bound, and fell back, lashing the water with his tail. Luckily I was out of the way of the blows; but was half drowned before I could get out of the storm of blood-stained foam which he raised around me. A minute after, at the sight of my enemy floating motionless and livid upon the water, frothing in the gaping wound, I raised a cry of triumph which was heard on both islands.'

'Day was breaking as I regained the shore, exhausted by the efforts I had been obliged to make to surmount the fast-increasing waves. The fishermen visited their nets; and almost at the same moment that I landed, the remains of Rafael and the body of the shark were drifted on the beach by the tide.'

The diver ceased, and appeared lost in profound reflection. After a short silence, he bethought himself of the rites of hospitality. Re-entering the hut, he stood

for some moments contemplating the beauty of his young wife, who had fallen asleep in the inner apartment, the loosened plaits of her long hair stretching to her feet. On the wall, dimly visible by the expiring light of two candles, hung a rude picture, representing souls in purgatory. Hastily turning away, Jose unrolled a Chinese mat in the outer apartment, which was to be my couch for the night. The accommodation on board our ship was not much better; but the narrative to which I had listened prevented me from sleeping, and the first faint streaks of dawn were just visible when the diver's voice spoke close to my ear:—'The breeze still blows, and the Guadalupe is about to lift her anchor.' I immediately rose, and taking leave of my host, returned on board without delay. The sails were dropped, and, yielding to the breeze, our vessel soon left the islands far behind. The next day we dropped anchor in the harbour of Pichilingue.

THE TRULY GREAT.

'If I were asked which of all the distinguished characters of whom I have read I would rather be, I should unhesitatingly say Alexander the Great,' was the exclamation of Francis Worthington, as he laid down a volume of Grecian history with a mind full of admiration of that renowned hero of antiquity.

'Your choice would be far from a happy one, my dear Frank,' his father quietly observed.

'Not a happy one, papa! What, should you not like to be the parent of an Alexander?'

'No, my boy—I have no such ambition; I would rather be the father of Frank Worthington.'

'You are surely jesting, papa? I cannot but think that you would like to see your son become as great.'

'I was never more in earnest, Frank; and if you seriously consider the subject, I think that you will allow that I am right. Alexander has, by general consent, been termed great; but now inform me, if you can, in what his greatness consisted?'

'Can you ask, papa, when he achieved such mighty conquests?'

'He did achieve mighty conquests; but tell me to what beneficial results those conquests led?' Francis looked a little puzzled at the question, and remained silent. 'He extended his power,' Mr Worthington resumed; 'but that power was not exercised in ameliorating the condition, or raising the character, of the nations he subdued. He caused the blood of thousands to be shed, and spread ruin and desolation where peace and plenty had formerly dwelt.'

'But great military achievements have always these attendant evils,' the youth interposed.

'And should they not on that account be deplored?' his father asked. Francis was again at a loss to reply.

'When wars are wholly defensive, and are engaged in for the purpose of protecting the rights and liberties of one's own country, they are not only justifiable, but praiseworthy; but such were not the wars of your favourite hero. He was instigated alone by ambition—the ambition to be styled a Conqueror.'

'He was ambitious certainly; but then his generosity was unbounded: surely generosity constitutes greatness, papa?'

'No, Frank, I cannot yield even that point. Generosity is indeed essential to true greatness; but it must be such generosity as Howard evinced when he performed his errand of philanthropy. The generosity of a Jenner who, at a noble self-sacrifice, forbore to keep that knowledge secret which, when known, conferred inestimable benefits on his species—of a Wilberforce or a Clarkson, when they stood almost alone in advocating the cause of freedom; not the prodigality of an Alexander, who lavished ill-gotten treasures on unworthy objects of favour.'

'Oh, papa, you speak very contemptuously of my hero. I thought everybody admired Alexander, and deemed him deserving the title he has always borne of the Great.'

'Such exploits as Alexander performed were likely to be admired in the rude ages, when it was universally acknowledged that military achievements conferred the highest possible glory on a nation; but in these enlightened days, such actions are seen in their true colours, and weighed in the balances of justice and morality.'

'But he was a heathen, papa, and on that account we ought not to expect the same from him as from the great men you have mentioned, who were brought up in the principles of Christianity.'

'True, my son, we must not look for Christian virtues in a heathen prince; yet as you hold him up as a demi-god, my object is to prove that he was possessed of vices which are altogether incompatible with true greatness. In the first place, his inordinate ambition led him to the practice of deception; for, not satisfied with human honours, he sought to impose on the credulous, by pretending that he was a descendant of Jupiter. You may remember, Frank, that the wise man of old has said that "greater is he that ruleth his spirit than he that taketh a city;" yet your Alexander was so wanting in self-government, that he slew his friend, with his own hand, in a fit of passion, only because he depreciated his achievements: then his death is generally supposed to have been caused by intemperance.'

'Ah, papa, you are exhibiting the blemishes of my hero; I was looking only at his shining qualities.'

'Such a course would, in some cases, be proper, being consistent with Christian charity,' his father observed; 'but in perusing the page of history, it will be injurious to the mind of youth to form a wrong estimate of the characters it presents to the view. Vice should be seen in its true aspects, and not through the medium of the shining qualities of which you speak; lest, whilst the young are admiring and imitating such striking virtues as courage and generosity, they be led to approve of, and even to commit, cruelty, injustice, and oppression.'

'Then, papa, I infer from what you say that greatness really consists in goodness?'

'Not exactly so, my dear boy; for there may be goodness without greatness, although greatness cannot exist without goodness. For instance, an individual may possess many excellent qualities, and yet be wanting in that strength of character which is a concomitant of greatness. Those milder virtues which make a man appear amiable in the every-day concerns of life may be designated goodness; whereas greatness exhibits loftier qualities, such as moral courage in cases of difficulty—fortitude in adverse circumstances—the exercise of strict justice, however opposed to self-interest—fearlessness under injuries—a self-sacrificing spirit, evinced where that sacrifice would benefit others, or promote an important end—the pursuance of honourable independence, even if it should lie in a humble path—the possession of a mind above the influence of prejudice—following the dictates of conscience, irrespective of the world's censure or applause. These virtues, my son, are more deserving of imitation than the military achievements and prodigal disregard of wealth which your hero displayed; and it is only when they are united with the milder graces of which I spoke, that the character becomes worthy of being denominated *truly great*.'

THE JEWS IN INDIA.

In Bombay and the neighbouring places there are some five or six thousand Israelites. Some of these have more recently come from Arabia, and are called *white Jews*. Some have come from Cochin, and are called *black Jews*. But by far the greater portion, who have been long settled in the country, and to whom *Mahratta* is the vernacular language, are called *Israelites*, or *Beni Israel*. When their ancestors arrived here is not certainly known. They say it was about 1600 years ago—that the ship in which they came was shipwrecked, and that seven men and seven women who escaped settled at Nagao, some thirty miles to the south-east of Bombay. They were at one time generally engaged in the manufacture of oil; but at present many of them are masons, carpenters, cultivators, &c. When the missionaries first came to this country some thirty years since, the Israelites were generally unable to read, and were almost wholly ignorant of their own Scriptures. They had generally ceased to observe the Sabbath as a day of rest, and were in many respects conformed to the customs of their Hindoo and Mohammedan neighbours. It is stated in a printed journal of one of the earlier missionaries, that the magistrate described them at that time as being the most drunken and troublesome people on the island. The missionaries in Bombay have, from the first, taken a deep interest in the Israelites or Jews. They early established schools among them, in which both sexes were taught to read. They furnished them with the Scriptures, translated into their vernacular language, and in-

structed several of them in Hebrew, that they might be able to refer to the original. The Jews have in consequence forsaken many of those things which they, on becoming acquainted with the Scriptures, found to be forbidden; and they have greatly advanced in intelligence, wealth, morality, and general respectability. Some of them may feel little gratitude for the labour and expense bestowed upon them; but we believe they are generally free to acknowledge that the missionaries have been their hearty well-wishers and their best friends. The Jews worship only one God, the Creator and Preserver of all things; and they regard all idolatry as sinful. They believe the Old Testament or first part of the Christian Scriptures, and that alone, to be the Word of God. They have two regular synagogues or places of public worship in Bombay, and one at Revadunda. Here they meet on Saturday, which is their Sabbath, or day of rest, and read the Scriptures both in Hebrew and Marhatta. At Alibag, Panwell, and other places, where there is no synagogue, their meetings are held in any private dwellings. The white Jews have two such places for public worship in the fort.—*Dnyanodaya.*

THE 'LABOURING POOR.'

The vigorous and laborious class of life has lately got, from the *bon ton* of the humanity of this day, the name of the 'labouring poor.' We have heard many plans for the relief of the 'labouring poor.' This puling jargon is not as innocent as it is foolish. In meddling with great affairs, weakness is never innocuous. Hitherto the name of poor (in the sense in which it is used to excite compassion) has not been used for those who can, but for those who cannot labour—for the sick and infirm, for orphan infancy, for languishing and decrepit age; but when we affect to pity, as poor, those who must labour, or the world cannot exist, we are trifling with the condition of mankind. It is the common doom of man that he must eat his bread by the sweat of his brow—that is, by the sweat of his body or the sweat of his mind. If this toil was inflicted as a curse, it is—as might be expected from the curses of the Father of all blessings—tempered with many alleviations, many comforts. Every attempt to fly from it, and to refuse the very terms of our existence, becomes much more truly a curse, and heavier pains and penalties fall upon those who would elude the tasks which are put upon them by the great Master Workman of the world, who, in his dealings with his creatures, sympathises with their weakness, and speaking of a creation wrought by mere will out of nothing, speaks of six days of labour and one of rest. I do not call a healthy young man, cheerful in his mind, and vigorous in his arms, I cannot call such a man poor; I cannot pity my kind as a kind, merely because they are men. This affected pity only tends to dissatisfy them with their condition, and to teach them to seek resources where no resources are to be found, in something else than their own industry, and frugality, and sobriety. Whatever may be the intention (which because I do not know, I cannot dispute) of those who would discontent mankind by this strange pity, they act towards us, in the consequences, as if they were our worst enemies.—*Burke.*

SELF-DEVOURING ANIMALS.

Dr Mortimer records the case of a boy living at Blade, Barnsley, in Yorkshire, who possessed so ravenous an appetite, 'that if he was not supplied with food immediately that he craved it, he would gnaw the flesh off his own bones.' The 'Quarterly Review,' October 1822, states that 'in the Jardin des Plantes, at Paris, there was an old hyena, which broke its leg by accident. One night, before the bone was united, the creature actually bit off the limb; and it was discovered in the morning that the animal had eaten it up, bone and all.' In Kennie's 'Insect Miscellanies,' it is related that 'an eminent entomologist having caught a green locust (*Acrida viridissima*), the creature, attempting to escape from his grasp, jerked off a hind leg. The limb was put with the insect in a vial, and was half devoured by the following morning.' Selby, in his 'Illustrations of British Ornithology,' mentions a captive eagle which plucked the flesh off its legs. Jesse says he has 'been assured that when rats have been caught by the foot or leg in a trap, they will sometimes gnaw off the limb in order to disengage themselves.'—*Gleanings in Natural History*, second series, p. 21. We have known mice, when just confined in a cage, gnaw their tails considerably, not from want of food, but apparently from vexation and remorse at not being able to escape from captivity. This

savage spirit, which induces animals to wreak their vengeance upon themselves when deeply mortified and enraged, finds some resemblance in the case of those persons who, when greatly perplexed, thwarted, or annoyed, bite their own nails, tear their hair, or even their flesh; or, according to the prevalent custom of some countries, scar their bodies with flints or with shells—a practice forbidden in the Scriptures. Many sorts of caterpillars and toads devour their cast-off skins—striking examples of that admirable economy of nature which permits nothing to be wasted.

THE GIFT.

Oh blessed, blessed flowers! the hand
That sent ye hither, pure and fair,
Though it had swept through all the land,
Could nothing home so lovely bear.

Most tender and most beautiful,
All fresh with dew, and rich with balm,
How from art's garlands dim and dull
Ye bear the glory and the palm!

When thus your gathered crowns I see,
Young queens of nature undefiled!
Methinks your only throne should be
The bosom of a little child.

Yet breathe once more upon my sense;
Ah, take my kiss your leaves among!
Ye fill me with a bliss intense,
Ye stir my soul to humblest song.

And not alone ye solace bring,
Sweet blossoms! to my present hour;
In every fairy cup and ring
I find a spell of memory's power.

In every odorous breath I feel
That thus, in other spring-times gay,
The lips of flowers did all unseal,
To whisper gladness round my way.

And there were friends with loving eyes,
And cheerful step, and words of mirth,
And there was heaven with smiling skies,
That bade us look beyond the earth.

Therefore my gentlest thanks I sing
To her who sent these tender flowers;
They to my present, solace bring,
And to my memory, vanished hours.

—*Knickerbocker.*

PENALTIES OF CRIME.

It is a striking attribute of men once thoroughly tainted by the indulgence of vicious schemes and stratagems, that they become wholly blinded to those plain paths of ambition which common sense makes manifest to ordinary ability. If we regard narrowly the lives of great criminals, we are often very much startled by the extraordinary acuteness, the profound calculation, the patient meditative energy which they have employed upon the conception and execution of a crime. We feel inclined to think that such intellectual power would have commanded great distinction, worthily used and guided; but we never find that these great criminals seemed to have been sensible of the opportunities to real eminence which they have thrown away. Often we observe that there has been before them vistas into worldly greatness, which, by no uncommon prudence and exertion, would have conducted honest men, half as clever, to fame and power; but with a strange obliquity of vision, they appear to have looked from these broad clear avenues, into some dark, tangled defile, in which, by the subtlest ingenuity, and through the most besetting perils, they may attain at last to the success of a fraud, or the enjoyment of a vice. In crime once indulged there is a wonderful fascination, and the fascination is, not rarely, great in proportion to the intellect of the criminal. There is always hope of reform for a dull, uneducated, stolid man, led by accident or temptation into guilt; but where a man of great ability, and highly educated, besots himself in the intoxication of dark and terrible excitements, takes impure delight in tortuous and slimy ways, the good angel abandons him for ever.—*Lucretia.*

HISTORICAL TABLEAU. CONQUESTS.

When lately in Ireland, I was, like all other tourists, struck with, and interested in, two things the opposite of each other—one, the surprising number of objects of antiquity, indicating a former age of wealth, literature, and refinement; the other, the absence of all present moral vigour, with a wretchedness the very nearest thing to an entire negation of property and comfort. You see the remains of ecclesiastical edifices with the most gorgeous carvings; stone crosses lying prone in the dust, any one of which would be the marvel of an English county; and in museums you are shown books of vellum, in the ancient Irish character, bound in gold and silver, and ornamented with precious stones, which are said to be worth, in the present day, thousands of pounds. In the collection of the Royal Irish Academy I was shown a copy of the gospels which had belonged to St Patrick; an almost coal-black little vellum book, that could not be a day less than fourteen hundred years old; and also a similarly antique copy of the Psalms of David, which had been the property of the pious Columba, who went as an apostle to Scotland about the year 563. The eventful history of these literary relics was of course duly verified, and afforded, among other things, room for much melancholy reflection.

Ireland possesses an Archæological Society, whose head-quarters are in Dublin, and which has issued a number of volumes, transcribed from the ancient manuscripts at their disposal. The books are unique as historical records, and reflect much credit on the diligence of the members. Many of these persons are not mere dilettanti Archæologists, in patent leather boots and figured satin waistcoats, and whose chatter is of tumuli, mummies, and painted glass windows. In going through the apartments of the Academy, you see old men with wrinkled faces and spectacles poring over ancient manuscripts, each of which looks as if it had lain a thousand years in a peat-moss, and then been taken out and dried before the fire. One thin little man, of a nervous temperament, whose devotions I dared to interrupt, told me that he had spent six months in trying to decipher a single page of St Patrick's gospels, and that he had succeeded in all but three words in the right-hand corner. 'I would give fifty pounds,' said the little man energetically, 'if I could discover the meaning of these three words.' There was Archæology!

Besides these precious manuscripts, the museum of the Royal Irish Academy contains a vast collection of gold ornaments of various sizes and shapes; some heavy and massive, others small and delicate, suitable, as it might seem, for decorating the brow of a princess,

or the wrist of a child. I was told, however, that these trinkets afforded but a meagre idea of the quantity of objects in pure gold which, from first to last, had been found in Ireland, and transferred to the melting-pots of the Dublin jewellers—coronets, rings, bracelets, and crosiers—realising large sums to the fortunate finders. It was the first time I had heard of all this, and I was of course correspondingly interested. I now felt that Moore had possessed something more tangible than a vague tradition for his mellifluous lyric—

'Rich and rare were the gems she wore,
And a bright gold ring on her wand she bore'—

allusive to a lady of rank who, in a species of Arcadian unconsciousness that there was such a thing as evil in the world, wandered about the country respected and unmolested. I left Ireland an Archæologist.

The Irish, though possessing no distinct individual history, would nevertheless appear to have been at one period the most learned nation in Europe. Egypt, Greece, Rome, Ireland—these seem to have been the countries in which learning of a refined nature progressively found refuge and repose. The manner in which the civilisation of each was in its turn laid prostrate was the same—MILITARY CONQUEST. Egypt was in part despoiled by Greece; Greece was similarly despoiled by Rome; Rome was despoiled by the Teutonic nations of the north; and two branches of these nations, the Danes and Anglo-Normans, completed the train of ruination by despoiling Ireland. Since their banishment thence, learning and literature have wandered, as if at random, through all the countries of Europe; but they are now, we hope, too deeply fixed, as well as too broadly scattered, to be again uprooted from their chosen soil.

In this view of affairs, Ireland is to England what Greece was to Rome—the spot whence it derived not a little of its civilisation, and which it afterwards maltreated in requital. In a word, and in all seriousness, IRELAND IS THE GREECE OF THE BRITISH ISLANDS—a country in which relics of a period of refinement are lying everywhere tumbled about, like mangled corpses on a field of battle; while in the midst of these remains are seen, crouching in mud hovels, the shattered remnant of the conquered people, impoverished, dispirited, and in many features of character demoralised. There is, however, nothing peculiar in their state of debasement. The same thing may be seen any day in fifty different regions of the globe. The wild Indian lights his fire from the branches of the noble alamo, as it intertwines with and enshrouds the royal ruins of Metasco (Spain did it). The Syrian Arab encamps under the shelter of rock-sculptured palaces in the silent glen of Wady Moosa (Assyrians and Saracens did it). The Bedouin of the desert tethers his camels in

the once splendid gardens of Babylon (Persia did it). A naked Fellah, whose last shirt has just been torn from his back for a tax not the twentieth part of a farthing—his only food a handful of dead locusts—shrinks from the bright glare of an Egyptian sun, within the shadow of a mighty propylon, which once resounded with hymns chanted by the priests of Isis, and which, even after two thousand years of decay, is covered with the most exquisite sculpture and hieroglyphics. (Nebuchadnezzar and his hosts, Cyrus and his armies, Alexander the 'Macedonian madman,' and Saladin the slayer, did it.) The poor downcast Greek of Scios is seen waiting on a luxurious savage, who sits smoking his long pipe, made of the stem of a cherry-tree, amidst the ruins of Delphinium (Romans and Turks did it). The Italian brigand, a splendid animal flaunting in pistols and ribbons, leans his carbine on the peristyle of a ruined edifice, now a cow-shed, but once the sumptuous villa of a Roman senator (the Teutonic hordes of Germany did it). The Irishman cabins his wife and pig in a sty built from the dilapidated halls of the classic and lordly Tara—(shall I again say who did it?) There are, however, fresher scenes for the Archaeologist. In a lone valley of Galicia is seen a ruined baronial castle. Its roof is half burnt off; the interior is a blackened and charred vault; and its vacant spectral windows resemble the mouths of a furnace. What is that moving through the gloomy den, like Christiana in the Valley of the Shadow of Death? It is a woman, a lady nursed in the halls of princes. A dying baby is clasped to her panting and sterile bosom. Her looks are wild; her face is famished, for she has been living a week on wild berries. She is looking eagerly for something. It is for the body of her husband, once the lord of the castle. She descends it, as it lies partially smothered among rubbish. Frantically she throws herself upon it. Her heart is like to burst. Her brain is on fire. God pity her, the last consolation of affection is denied! She cannot kiss the cold lips of him on whom she was wont to look with delight. A week ago the head was cut off, and sent labelled in a sack to Vienna. Rising to her knees, and with outstretched arms, she utters a cry of horror and despair, the last sounds of expiring reason. The shriek rings amidst the charred rafters and through the vacant roof. It is carried up by the angel of Mercy, and reported at the throne of Him who hath declared he shall one day judge the world in Righteousness (**AUSTRIA HAS JUST DONE IT**). We may drop the curtain. Why does not David Roberts give us an immortal work, **PICTURES OF THE RUINS OF NATIONS—WITH THEIR TENANTRY?** It would be the very Epic of Painting.

Out of the whole set of adventurers who produced these multifarious disorders, the Romans were, on the whole, the best. They were ambitious, but not cruel; and in all matters of municipal concern, in the countries which they conquered, they were perfectly tolerant and accommodating. All they ever cared about was imperial sovereignty and tribute. The people whom they took in charge might worship what they liked, and live in any way they liked, provided they sent annually to Rome a certain quantity of cash. The Turks were the next best; tribute with them being also the great thing; but they were intolerant and cruel, and smashed all objects of art in pieces. The Danes were a kind of sea Turks; they went about plundering and subduing nations, greedy for tribute, and regardless of what havoc they committed among the fine arts. Out of the whole, the Spaniards have been decidedly the worst. With them, conquest was annihilation. Not

satisfied with a military sovereignty and tribute, like their half-ancestors the Romans, they took lands, houses, wealth of all sorts, burnt every record of independence, and finished by taking the people, whom they reduced to the condition of beasts of burden, till every one of them died.

The English, with respect to their conquests, have acted throughout pretty much like the Romans in similar circumstances. They have never meant ill towards any nation which they conquered; they have always at least been full of professions as to taking foreign nations in charge purely for their good. Never were there such lambs of conquerors, if you were to believe their own story. Any one, however, who wishes to get at the truth, must not sit down by the fireside and look into books. He must put his hat on his head, and take his staff in his hand, and go and take a view of the things which books do not speak out upon. Let him, if he is not afraid, cross the sea to Ireland, where he will see as hopeless a coil of confusion as ever was exhibited by any nation ruled by the imperial Cæsars.

Reflecting on what may be observed in an excursion of this kind to Ireland, and at the same time bearing in mind the aforesaid lamb-like character of the conquerors, we inevitably arrive at the conviction that there is, and must have been from the beginning, something radically bad in the whole conquering process. Can any one imagine what this can be? Let us hazard a guess or two.

In the first place, the acquisition is by **VIOLENCE AND INJUSTICE**. That is just as clear as that the sun is in heaven. A great number of men, very much in want of employment, some of them on horses, and others on foot, land in a strange country which perhaps never before heard of them, and being expert in the use of certain weapons which they carry in their hands, and very powerful, they, without rhyme or reason, all at once begin knocking the people about, and making themselves masters of their country and all that is in it. This treatment being considered somewhat unkind and unreasonable, the people very likely ask what it means. They cannot possibly understand why they should lose their country! In some instances the commanders of the men with the weapons vouchsafe an answer, and sometimes they don't. The Spaniards were always exceedingly polite in answering questions of this unpleasant nature. They came prepared for it. Along with every squad there went a first-rate logician, the pick of the Spanish universities, who, if required, and at a moment's notice, could have proved that black was white, or that two and two made five: nothing came amiss to him. This useful personage never made his appearance till all the party were landed, and the talk about the why and wherefore had begun. Exactly in the nick of time he was introduced, and he took especial care to come forward in a dress which helped materially to mystify his audience. Clearing his throat, he delivered, through an interpreter, a remarkably neat harangue, in which he showed, by a course of history which began at the creation of the world, how the Spaniards were entitled, by every principle in law, reason, and divinity, to take possession of the country. And on concluding his discourse, he never omitted one important particular, which was this:—'My good friends, if you remain unconvinced after all I have said to you, I shall be under the very disagreeable necessity of allowing these gentlemen to do their duty'—pointing, almost with tears in his eyes,

to a row of stout fellows on horseback, frowning terrifically through their bushy beards and eyebrows, and handling their long knives as if ready to fall to. This latter argument usually prevailed. Bamboozled and frightened, the unhappy wretches scratched their sun-burnt pates, and with a discontented growl submitted to their doom. The accounts of these interviews are among the richest things in history.

The English, to do them justice, never tried to come over the people whom they wished to conquer in this fashion. They would not give themselves the trouble. Yet, considering what a wise and saturnine people they are, they have done some remarkably odd things; and this brings us to a striking feature of our tableau. When an agriculturist gets uncomfortably rich on a good farm, he begins to have a fancy to take another, which he understands is to be let a number of miles off, and which he proposes to manage by means of servants and post-letters. This is called in Scotland 'taking a led-farm.' He accordingly strikes the bargain, which, ten chances to one, turns out a losing concern. The servants are far from being dishonest; they do all they can for their master; still the thing, somehow, won't pay. The ambitious agriculturist discovers his error when too late; he would give the lease of the led-farm to anybody who would take it off his hands; and as nobody will, it hangs like a millstone about his neck—*till he is ruined*. England on one occasion took a fancy to make a led-farm of Scotland, as she had previously done of Ireland. The way it happened was this. The Scotch having some difficulty in knowing which of two competing princes to choose as king, they, in order not to fight about it, referred the matter to the arbitration of the king of England. This king was selfish and knowing; and what did he do but get Scotland a good deal into his own hands, on pretence of keeping things in order, and then say that he was the proper king of the country himself. The Scotch, however, would not stand this sort of usage, and the unjust king, with his banditti, each one of whom expected a snap at something good, were at length fain to give up the affair as a bad job. It is, now-a-days, generally felt by the English that it was as well, if not better, that their cunning and avaricious old king did not on the above occasion get hold of Scotland, to make a led-farm of her, for she might have proved another Ireland, and then England would have had two millstones around her neck instead of one. *Fortunate escape that was!*

Talking of this, and if I am not tiring the reader with these historical portraiture, I may call to mind another escape which the English made from millstoneing. When the Normans gained possession of England they still retained their French territories; and these, by means of fighting, intermarrying, and balderdash sophistry, they contrived to swell out to such a size, that they included the whole of France. Being now kings of France as well as England, they seem to have hesitated considerably with respect to which country they should stay in, and which they should turn into a led-farm. England saw very little of them during these hesitations. At length they decided on setting up housekeeping permanently in England, which always abounded in good butchers' shops, and of making France the led-farm. Having, after many doubts, come to this resolution, they despatched two dukes and a bishop to live in Paris, and do what they could to keep things from going to disorder in their absence. The French were very far from being in a pleasant humour with these delegates, and were constantly telling them

to go away home, and threatening their lives if they didn't.

At this juncture a very strange affair happened. A little girl, a quiet, modest, thoughtful creature, who lived near the village of Domremy on the borders of Lorraine, and whose employment was herding sheep, came home one day to her mother and said that she had seen an angel. The little girl had of course been dreaming while asleep, as she lay on the sunny hill-side tending her small flock. However, one of the features of her character was a wild earnestness, which would not admit this interpretation of her vision. She stuck to her story, and insisted that she had seen an angel, who told her to rouse the French nation, and drive away the English. Was ever anything so frantic heard of? What a notion for a poor little herd lassie! Her mother and everybody said it was all nonsense; but the girl would not be driven from her purpose. She went away on a wandering excursion; spoke to this one and spoke to that one; and actually had the address to put herself at the head of an army. Long and desperate were the fights which ensued. The English were everywhere beaten; and the two dukes and the bishop were reduced to great straits. Enraged beyond measure at the courageous efforts of the little girl, they tried every sort of plan to catch her; and, by an accidental turn of affairs, they succeeded. Now was the time to do for the maiden of Domremy! They made short work of her. The bishop proved, by a line of reasoning which very easily convinced the dukes, that the girl was a witch; and so, being a witch, they burnt her to ashes with a collection of tar-barrels in the town of Rouen! With what emotions of compassion, horror, and shame—shame for England—have I looked around the square, with its antique buildings, where this fearful crime was perpetrated! Neither the bishop nor the dukes had a day to do well afterwards. The French rose *en-masse*, and turned them, and every one who belonged to them, out of the country. Thus was France saved from being made a led-farm, and England once more saved from being millstoned. Another fortunate escape that was!

There are differences in the manner in which conquered countries are brought efficiently into the condition of led-farms. The Spaniards, as has been seen, gave their preaching first, and did their killing afterwards. The English reverse the practice. They begin with the killing, and end with the preaching. Not that they ever want to kill; it is only people's own blame if they won't be quiet, and so get knocked on the head. True, it is all the same in the end; but it is satisfactory to go by regular rules. Having got the people somehow or other to be quiet, the next step which the English take is to land three boxes from a ship. These boxes are made up in London by persons who know all about it, for they have had immense experience in the trade. What is imported in these boxes is of the first consequence. Is the reader curious to know what are the contents? I shall tell him.

In the first box is contained a theodolite, with the entire apparatus for measuring land. In the second box is contained a set of the statutes at large from the reign of Edward I., with a copy of Blackstone's Commentaries on the law of England, and a chief justice's gown and wig. In the third box are found all suitable paraphernalia for the church service. Until these things have been opened out and brought into use, the constitution cannot be said to have begun. The theodolite usually

puzzles the natives. While loitering, poor innocents, about their cottage-doors on a sunny forenoon, they are very much struck with observing a man in a stooping posture, who is looking through a strange brass instrument mounted on three wooden legs. First he looks this way, and then he looks that way; he goes across fields, enters gardens, and pushes through hedges; and everywhere is he seen looking through that very droll instrument. They cannot make out what he is about; and they never do make it out till some months afterwards, when they are visited by a man with a red neck to his coat, who tells them to be off, for their lands now constitute Lot 17, Section D, in the third Concession of Bundle-and-go County, and were sold by auction yesterday at seven-and-threepence an acre. They might have bought them if they had a mind; the auction was duly advertised by the sheriff.

When the French take possession of countries they also bring boxes ashore, but their contents are somewhat different. Roads and land-measuring they don't care about; and a field-marshal's baton is the sum and substance of their constitution. Still they cannot do without bringing boxes along with them. These packages are made up in a tradesmanlike manner in a large establishment at the end of the Rue Richelieu. They contain a complete set of the plays of Molière, Corneille, Racine, and Voltaire; a great variety of dresses for mock kings, priests, soldiers, bandits, distressed ladies, savage old fathers, rebellious sons, clever waiting-maids, and so on. And in attendance on the boxes there is a troop of men and women, who are to perform the parts of these personages. A good supply of rouge, pomatum, and moustaches is not forgotten. With all these things the French set up a theatre wherewith to keep them merry in their exile from Paris; and provided they are allowed to do this in peace, they get on pretty well. Outrageous things no doubt they have done, as in Algiers; but it is a universal remark, that no foreign possessions are in the main so kindly treated as those of France; the truth being, that the French do not care a whistle about any country they go to, except to have the glory of calling the country their own, and giving it a taste of the legitimate drama.

Gipsies, thieves, and all other predacious classes have a language of their own, by which they can conceal or treat with levity any crime they commit. Any piece of deceit they call a *lurk*; to thieve is to *prig*. Something of the like ingenuity may be observed to exist with respect to conquered nations. In travelling through Germany, your voiture stops for a short time in a neatly-built, dull town. To stretch your legs, you walk to the end of the street, where stands a great whitewashed palace, with gardens behind it of a superb description. You walk into the gardens, and all through them, but there is nobody there. Flowers are blooming and opening their sweet petals to the sun; but there is nobody there to enjoy their beauty or perfume. A long row of orange-trees, each growing from a green-painted tub, the size of a sugar-barrel, in vain offers the spectacle of its golden fruit; nobody is there to rejoice in the feast. Leaden gods and goddesses, seated in the midst of fountains, are busy spouting water from their mouths, as if their cheeks were like to burst; but not a soul is there to see them—literally no one, except a decayed gendarme with one eye and a wooden leg, who sits by himself all day long under a tree playing at dominoes, his right hand against his left. You come back to the town, and with increasing interest you begin to observe that there is

nobody in it. Not a living thing is seen in the street but two broken-hearted hens, which go disconsolately about looking for crumbs, having not been able to scratch up a single particle of food since breakfast time. What a marvellous phenomenon! Desperate with curiosity, you hasten to the inn, where stand your horses munching slices of brown bread out of a trough, and you ask Boniface what is the matter; has the town been conquered, and all the people carried away? 'Not exactly conquered, monsieur; we have only been *mediatised*. Bonaparte *mediatised* us one afternoon, when on his way to Russia. It was done, I am told, in seventeen minutes and a half: the document was signed on the top of a bass-drum.' *Mediatised*, you afterwards learn, is a slang law phrase, which signifies to be extinguished as a nation, and the country given away to different adjoining sovereignties—a bit to one, and a bit to another. Most of the German states have several times, without leave asked, been cut up, ruined, and handed from one to another in this free-and-easy fashion. The people grumble horribly, to be sure, to be so tossed about; but what can they do? Perhaps they are nursing up their vengeance!

Whatever be the actual methods of operation, it all comes to this: nations dishonestly taken possession of, like ill-got wealth, seldom thrive. 'We may read our sin in our punishment;' so saith the Scripture. 'Our pleasant vices make us whips to scourge us:' so says Shakespeare. 'Every immoral act contains the seeds of its own dissolution;' so says Philosophy. True, there are examples of military aggression—that *INQUIRY OF INIQUITIES*, of which the world has too long been tolerant—being not unattended with benefit and social happiness to the conqueror as well as the conquered; but in these a new sequence of action is evoked, of which I may afterwards have occasion to speak. Meanwhile I confine myself exclusively to the first or fundamental principle, followed by its usually rude and troublesome consequences. As to what may be inferred from the secondary or healing principle, I need not now further advert to it, than by saying that it is partly embraced in that sublime sentiment of Ezekiel, which forms the opening passage of every Englishman's Book of Common Prayer—'When the wicked man turneth away from his wickedness that he hath committed, and doeth that which is lawful and right, he shall save his soul alive.' Here Ireland, that terrible word, rises up in judgment—transgressions committed and persevered in hundreds of years ago, but for which, in the nature of immutable moral laws, there seems to be no oblivion. The only shade of penitential consolation consists in the fact, that the Danes were before the English in the diabolical work of mischief. But for these marauding wretches, what would that beautiful isle of the ocean not have been? Along the whole eastern coast are seen traces of their rapacity. Near Drogheda, on the borders of Louth, the seat of the great mediæval colleges of learning, I crept on my hands and knees into a temple of remote antiquity, and with candles brought with me on purpose, lighted up a dome-shaped vault of the most interesting construction; which, since its visit by the Danes, has been a scene of the wildest desolation. The ragged carman who acted as guide on the occasion had the Irish Monasticon by heart, and could tell who built, who endowed, who sacked, and who pocketed the rental of every ruined abbey which we passed. Such is Ireland, a country which, I confidently believe, is till this minute not understood by the English. W. C.

THE FISHERMAN.

It would be a curious and picturesque trip to embark in a coasting-vessel, and from port to port, from village to village, to visit all the shores of France; to go from Dunkirk to Bayonne in the Western Ocean, from Port Vendre to Cannes in the Mediterranean; to behold, gradually defiling before you, the undulating downs of the north, the white steeps of Normandy, the savage rocks of Finisterre, the smiling groves of Vendée, the wooded meads of the Gironde; and, mingling with the amphibious population of the coasts, to study and delineate from the life sailors, fishermen, preventives, smugglers, wreckers—all those who live by the sea, in skimming its surface, in fathoming its depths, in confronting its treacherous caprices.

The fishermen especially form a race apart, the more worthy of observation, as, from the nature of their life and habits, they present a perfect contrast with the industrial occupants of the interior. Characteristic traits common to the whole fraternity everywhere abound, although they are spread over a line of coast upwards of a thousand miles in extent. The species of the fish which they abstract from their liquid retreat varies according to the latitude; the tackle employed is modified according to the genus and locality of the prey which they pursue; but in the north or in the south, we find an ever-prevailing analogy in the minds, habits, and manners of fishermen. He who harpoons the tunny off Marseilles, differs but little from the Norman who caters for the saloons of Paris, or from the Breton, who tempts with a bait of red roe the shoals of migrating pilchards. At all points they inhabit the same cabins hung with nets, half buried in the sands, or perched like nests on the summit of a cliff. They are men of the same masculine figure, the same nervous limbs, the same healthy complexion—active, agile, indefatigable—sober as much from principle as necessity—freed from vice and corruption by isolation and by labour.

While children, the boys are occupied in collecting shrimps, cockles, and other shell-fish which are to be found upon the strand; and at about twelve years of age they accompany their fathers to the fishery. They set sail as the tide begins to turn, and avail themselves of the reflux to regain the shore. Thus twelve hours out of the twenty-four, one-half of the lives of the fishermen, they pass upon the sea. Their boat is at once their workshop, their refectory, their dormitory, and their magazine.

The fishermen's wives, not less industrious than their husbands, stretch the lines along the beach, mend the nets, gather oysters from the rocks at low-water, and carry the fish to market, without at the same time neglecting the cares of the household, and the education of a progeny always numerous. They watch for the return of their husbands, and when these re-enter the port, assist in unloading the vessel, in which the produce of the fishery glitters in silvery heaps. Often, alas! they watch in vain; too often the waves give them back but shattered wrecks and disfigured corpses. But recently, in the early part of July 1841, a numerous crowd was assembled upon the shore at Saint-Valéry-sur-Somme, while a violent squall lashed the surface of the sea, and far in the distance a man was visible, clinging to the keel of an over-set boat. An infant was upon his shoulders, whose feeble arms convulsively grasped its father's neck, and the hapless couple floated at the mercy of the waves.

A single fisherman had launched his little boat, and succeeded, after long and perilous efforts, in arriving within a few feet of the drowning persons; he stretched a boat-hook towards them, which the father essayed to grasp with one hand, without quitting his hold of the wrecked boat. At this moment a woman, bearing a basket of bread and boiled herbs, joined the spectators of this scene of desolation. 'What is the matter!' she asked. 'Look!' said one of the bystanders, 'yonder is Pierre Coulon drowning with his son.'

The woman was the wife of the fisherman; before night, his widow.

The fishermen who risk their lives in the pursuit of

their occupation, never hesitate to brave dangers for the salvation of others. They have cast the rope of safety to many a shipwrecked mariner; they have dragged from the billows many a victim; rescued from the reefs many a half-drowned wretch; gained many a public recompense. The Dieppe fisherman Bousard, who obtained the honourable surname of 'the Brave,' has left many a successor among his compatriots. The rocky shores of Finisterre alone of all the French coasts were long redoubtable to vessels in distress. The inhabitants placed a lantern between the horns of a cow, whose head they had fastened to the right leg with a cord. The animal, in bending the knee to walk, alternately raised and lowered its head, and the movements thus communicated to the lantern imitated those of a ship's light. Mariners who had lost their course believed that, in this vacillating light, they saw a faithful guide to a hospitable shore; but, deceived by the infamous fraud, they were precipitated upon the fatal rocks, and their last drowning cries of agony were welcomed by the savage clamours of the pirates. These acts of barbarity have happily ceased; the Breton fisherman is, as formerly, greedy of waifs, but the love of pillage does not stifle in his bosom the sentiments of humanity.

There is no class of men who have more affection for their natal soil. All attempts to naturalise them elsewhere than on the borders of the sea would be vain: there they were born, there they wish to die. Their precarious and sorry huts are dearer to them than palaces. Sometimes the moving sand, which the storms of wind raise in vast billows, swallow up entire hamlets. Some fine morning, the inmates, astonished that the dawn does not appear, perceive that they have been buried with their domicile. Nothing daunted, they reconnoitre from the chimney, and having dug a passage through the roof, set peaceably to work to disinter their dwelling. In other quarters the coast is bordered with cliffs, on the platforms of which the fishermen build their cots, while the sea slowly saps the base. Such are the favourite dwellings of a race of men familiar with all the dangers of waves, winds, and sunken rocks.

Pierre Vass had established himself upon the coast of Calvados, between the town of Armanges and the Fort of Maisy, at a little distance from Grandchamp. Pierre had lost his wife; the last of his sons had died at Trafalgar, and there remained to him but a daughter twelve years old. Though past the middle age, he had still sufficient health and strength to pursue his avocations with the assistance of his child. Lodged in a cabin upon the summit of a precipitous cliff, he descended to the sea by steps cut in the chalky soil. He fixed stakes in the sand, to which the little Louise attached long nets, and at low-water, soles, whiting, cod-fish, and flounders were taken in their attempts to regain the open sea.

The neighbours of Pierre Vass often made their observations upon the insecurity of his residence. The waves undermined the cliff, which fell away in masses. 'My house is not very firm,' said Pierre Vass, 'but I have dwelt in it more than thirty years; all my children were born there, and my poor wife lived in it—God re-unite us when he shall judge proper! I will die surrounded by my old remembrances.'

One day a tempest arose, the billows dashed against the cliff with fury, the wind shook the house of Pierre Vass, and the rocks started and cracked with a terrific noise. The old fisherman, habitually melancholy, seemed now lost in a dream. From time to time he rose, and opened the window to look out upon the dismal scene; then reseating himself, he would remain, his head resting upon his hands, a prey to some strange hallucination.

'Louise,' said he to his daughter, 'take this basket of fish and carry it to your uncle at Grandchamp.'

'Look at the dreadful weather, father!'

'He regales his friends to-morrow, and has need of provisions. Go directly—make haste,' added the old fisherman in a tone of severity, mingled with an indefinable expression of tenderness.

Louise was accustomed to passive obedience, and was soon ready. 'Adieu, father; I will be back before it is dark.'

'No; sleep at your uncle's to-night; you can return to-morrow. Adieu, my child—adieu. Heaven preserve you!'

He embraced her with passionate emotion, tore himself from her arms, and watched her disappear in the distance so long as his fast-falling tears permitted him to behold her. The house of Pierre Vass and five neighbouring cabins disappeared during the night.

This attachment of the fisherman for the rocks of his country, for the waves by which, and on which he lives, for the advantages, and even the dangers of his profession, is the cause of his submitting to the military service with an insurmountable repugnance. It is not that he is cowardly; he exhibits, on the contrary, a well-tryed courage. Separated from death only by a few frail planks, he traverses the open sea, borne fearlessly onward at the caprice of the stormy waves. But a soldier he will not be; he would languish under the tedium of the apprenticeship; the air of the canteen would be more fatal to him than the balls of the enemy.

A fisherman of Etretat, named Romain Bizon, was named in the conscription of 1810. The other conscripts quitted their homes to join the army, but Romain Bizon answered not the appeal. His mother declared that he had departed by night without taking leave. His betrothed bemoaned him as if lost for ever, and showed herself not insensible to the advances of a new suitor. Descriptions of the deserter were sent to every brigade; the gendarmes rummaged the village and its neighbourhood, but Romain Bizon had disappeared.

At the distance of half a league from Etretat there is a cliff of immense height; the side which fronts the open sea rises precipitously to a point. Towards the centre of this facade there is a grotto, which the inhabitants to this day call the cave of Romain Bizon. It was there, in fact, that he had taken refuge. He had scaled the summit of the cliff, and by means of a rope, which he had succeeded in fixing firmly, had slid down perpendicularly as far as the opening of the grotto, more than a hundred and fifty feet below. Thence, by means of another rope, he descended every night to the strand, fished among the clefts of the rocks, received the visits of his mother and his betrothed, who brought him provisions, and before the break of day regained his inaccessible retreat. Several months had thus passed away, when the bold deserter was betrayed by the light of a fire which he had the imprudence to kindle during the night. The mayor gave notice to the lieutenant of the guard, and both swore to capture the rebel Romain Bizon alive or dead. But how to get at him! They were ignorant of his mode of access to the grotto, which was more than a hundred feet above the level of the shore, and the base of the cliff was bathed by the rising tide.

When the tide had receded, the mayor, girt with his scarf, the lieutenant at the head of his detachment, advanced upon the sand, and hailed Romain Bizon, who gave no sign of life. 'This joker wants the honour of a siege in form,' said the mayor; 'come, lieutenant, do your duty.'

'Prepare, armes!' commanded the lieutenant of the guard in a formidable voice.

In less than a minute the fire of a platoon was directed against the grotto; whilst, armed with poles, cramp-irons, ladders, and ropes, a band of officials made their preparations for the perilous ascent. Romain Bizon had remained hitherto invisible, but at the moment they were commencing the assault, he showed himself suddenly, and wielding a pickaxe, detached huge masses of rock, which showered upon his enemies. In a twinkling the troop began to make a retrograde movement, and the tide, now returning, decided the victory in favour of the refractory fisherman.

The next morning the rope which served him for a ladder swung idly from the cavern to the sands beneath; but Romain Bizon was no longer there. Eight years rolled away before he returned to Etretat. He arrived there about nine o'clock on a raw and gusty evening in autumn. The inhabitants had retired to rest, but one door was yet open, over which was inscribed, in charac-

ters of primitive form, 'Good draught cider.' Romain Bizon entered, seated himself, and invited the landlord, who was alone, to discuss with him a pot of his best liquor.

The host, surprised at the visit of a stranger at so late an hour, commenced the conversation. 'You are not a native of this part!'

'No; but I passed a considerable time here formerly, in the emperor's day. At that period there was a great deal of talk of one Romain Bizon. Have you any recollection of that?'

In spite of the affected indifference of the unknown, he trembled in pronouncing these words.

'Parbleu!' said the host, 'everybody knows that story. He was much sought after for a long time; but it appeared that he had embarked, under a false name, on board a privateer from Havre, and that he died a prisoner in England. 'Tis hardly six months ago that we buried his mother—the poor old soul! She had had a deal of trouble.'

The stranger kept silence; but without taking his elbows from the table, he clasped his hands together, wrung them in evident anguish, and sighed bitterly.

'I am sorry,' said the landlord, 'that what I have said appears to give you pain; but did you know that family?'

'A little,' stammered the unknown. 'Was not Romain betrothed to a girl named Madeline Lebreton? What is become of her?'

'Madeline! Bah! she is my wife!' said the host.

The stranger made an exclamation expressive of pain and bitter disappointment, then appeared to fall into a state of profound stupefaction.

'There is nothing astonishing in that,' said the host unmoved; 'she could not always remain single, because her future husband had chosen to decamp.' The stranger, who had buried his face in his hands, did not reply.

'Barnaby,' cried a voice at that instant, 'are you not going to shut up! It is growing very late, and we shall be fined.'

'One minute, Madeline,' replied the host: 'I am speaking with a guest. Put the children to bed; I will be with you directly.'

Urged by feminine curiosity, Madeline descended to the shop. The stranger had risen at the sound of her step, had cast upon the table a piece of money, and had his hand upon the latch at the moment that Madeline presented herself. He could not refrain from turning round to look once more upon her whom he had so much loved. She recognised him instantly. 'Ah, my God!' cried she, 'it is Romain!'

'Adieu, Madeline!—adieu! Here is the pledge you gave me eight years ago. You will see me no more.'

He cast the ring at her feet, and darting out, ran desperately towards the sea-coast. The host followed in pursuit, but arrived at the darkening sea only in time to hear his last agonising cry mingled with the murmuring of the waves.

A NEW CHAPTER IN NATURAL HISTORY.

HOWEVER regularly like gives birth to like in the higher orders of animals, it is a law by no means universal among the lower or invertebrate races, as has been recently demonstrated by Sara, Steenstrup,* and other continental philosophers. Among these humbler creatures, it has been shown that the progeny often bears no resemblance, either in form or in functions, to the parent; that the progeny again gives rise to a third form, differing as widely from either of its predecessors, but returns, it may be, in the fourth generation, to the form of the primitive parent. Thus A may give birth to B, B to C, and C to a progeny which reverts to the original A; so that a parent

* The reader is referred to Steenstrup's interesting essay on the 'Alternation of Generations,' translated and printed for the Ray Society.

is not represented by her daughter or granddaughter, but by her great-granddaughter, or great-great-granddaughter, who becomes in turn the medium through which the species is perpetuated. This curious process is known to naturalists by the title of *Alternate Generation*—a process so completely at variance with the every-day maxim of 'like father like son,' that we are sure few subjects could be more interesting to the intelligent reader than a brief and untechnical account of its character.

This alternation of generations, whereby the maternal animal does not meet with its resemblance in its own brood, but in its descendants of the second, third, or fourth generation, is totally different from what we see in the ordinary mode of reproduction, and not less distinct from what we call metamorphosis. In ordinary generation among mammalian animals, the young, at the earliest stage of its separate existence, so closely resembles the parent, that there is no difficulty in assigning it to its peculiar species. Birds, though produced from eggs by external incubation, 'present no intermediate stage of active life, but pass at once into the form of their respective progenitors. And so also with fishes—the lowest of vertebrate classes: each speck of spawn passes in time into a perfect fish like its parent—presenting, it may be, very different aspects in its embryonic progress, but still retaining its individuality or oneness of existence. Such is the ordinary mode of reproduction; wonderful no doubt, and surpassingly beautiful in all its harmonies and relations, but not so strange as that of metamorphic life, and less startling still than that of alternate generation.

In metamorphosis, the animal passes through a circle of forms, often differing widely from one another, but still retaining the same vital principle or unity of existence. The successive forms are passively assumed; and in none, save the primitive parent, is there any reproductive or multiplying power. Take the frog, for example, which deposits its spawn in the wayside pool. Every speck or egg of this spawn becomes, under the proper conditions of moisture, temperature, and so forth, a tadpole, which is strictly aquatic; breathes by gills, sculls itself by an oar-like tail, and altogether presents a form so different from that of its parent frog, that no one could possibly predicate its original connexion. By and by an internal skeleton is formed, legs begin to appear, the tail drops off, the gills are replaced by internal lungs, and the tadpole passes into the perfect amphibious frog. Throughout this beautiful transformation everything has been passive, and limited to one exhibition of vitality—from the spawn arose the tadpole, from the tadpole the frog, in whom centered again the active power of reproduction. The tadpole might have been kept in the tadpole state for ages, without giving birth to other tadpoles; and therein consists one grand distinction between metamorphosis and alternate generation. To illustrate still farther, let us take another instance of metamorphosis. The common white butterfly drops its eggs on a cabbage leaf; from each of these, in a few days, springs a voracious caterpillar, having no feature in common with the maternal butterfly. A little longer, and the caterpillar instinctively seeks some sheltered crevice, becomes dormant, passes into a chrysalis, which differs as widely from the caterpillar as it does from the butterfly; and from this chrysalis springs in time the fluttering insect of another summer. Wonderful, again, but all limited and passive! Neither caterpillar nor chrysalis could give birth to others of their kind: with the butterfly alone, of which the others were but metamorphosed forms, lay the power of increase.

Alternate generation differs from the preceding modes of reproduction, inasmuch as the several intermediate forms have the power of increase as well as the original parent. This curious phenomenon has as yet been traced with accuracy only in three or four animals, from which we may select for illustration the common 'jelly-fishes,' 'sea-nettles,' or *medusæ* of our own shores. These creatures are of a gelatinous consistence, very

soft, and transparent as glass, and are met with of various forms—discoid, hemispherical, or bell-shaped—and they may be seen swimming about immediately below the surface of the water, at sea, or in creeks, from spring till late in the autumn, but only when the surface is tranquil, and no rain has been falling. They occur in vast numbers, especially where streams enter the sea; and they swim more deeply in the water when the surface is rough, or after a fall of rain—the slightest shower causing them to descend rapidly. Every frequenter of the sea-shore must have seen the jelly-like masses lying in hundreds on the sand after a storm in autumn; but then they are likely to be bruised, or partly shrivelled; and to see with advantage their varied rays and hues, their long pendent tentacula, and their curious mode of progression, one must observe them in deep water. On the approach of winter, they withdraw themselves to a greater depth, or probably nearly all die out at that period. Before doing so, however, they perform the important function of reproduction, the spawn or ova of the female make their escape, and these we shall now trace through their startling transformations.

An ovum, on its first escape from the parent, is a small roundish oblong body, floating freely in the water, but capable of locomotion, which is accomplished by means of innumerable *cilia*, or minute filaments, that cover its surface. By and by a small disk appears at one extremity, and by this it becomes immovably attached to some sea-weed or other substance. This is stage the *first*. In a few days the egg has become a polype, having a stalk of attachment, and a bell-shaped body, fringed with tentacula or filaments, by which it secures its food from the surrounding water. This is stage the *second*, in which it is a true polype, acting precisely as the hydra or fresh-water polype, and capable of increase by buds or gemmation. A little longer, and the body of the polype increases in length and thickness, and is marked by numerous transverse rings. These rings become lines of separation, little processes spring from their edges, the separation between the segments become more decided, and instead of a polype we have now a pile of cup-like bodies, seated within one another, each possessing a perfect life and individuality. This is stage the *third*. By and by the sections of the cup-like pile separate, each becomes a little fringed floater, like an inverted parasol; and from this stage (the *fourth*) they pass by degrees into perfect medusæ. We say a little fringed floater, for at this stage the creature is only a few lines long, while the full-grown medusa is a million times larger, often spanning a space of several fathoms with its tentacula, and swimming about freely in the ocean. Here, then, if there be no error in the observation, is one of the most curious transformations in nature. A medusa gives birth to a number of ova, which in time become polypes capable of multiplying themselves; and each polype separates into numerous cup-like creatures, which ultimately revert to true medusæ. Had the original ovum merely passed into a polypi-form, the polype into a cup-shaped creature, and this again into a medusa, the transformation would have been one of simple metamorphosis; but that the intermediate stages should be endowed with a power of reproduction, is that which constitutes the marvel.

Other examples of alternate generation might be added, as that of the *corinææ*, or claviform polypes; the *salpæ*, these curious molluscs which are often observed floating in chains of from twenty to fifty in number; and the *trematoda*—that is, the fluke or liver-worm, which inhabits the liver of sheep in peculiar situations, and especially in wet years, causing much sickness among those animals. Enough, however, has been given to exhibit the peculiar character of the phenomenon—a phenomenon the explanation of which at once enlarges our views of creation, and inculcates humility and caution. In strict philosophy, we cannot regard the medusa, the polype, and the cup-like creatures, as belonging to different species; they are part and parcel of one great specific circle, indispensably necessary to each other and must

be regarded, however dissimilar in form and functions, as belonging to the same vital unit. It may thus happen, as the subject of alternating generations is better known, that many of the so-called species and genera of the invertebrata are neither one nor the other, but component forms of some circle of alternate generation. We regard the butterfly, caterpillar, and chrysalis as one; so also it will be with these curious circles of generation when their limits are determined.

It will now be seen how widely this alternating system differs from the ordinary course of generation, and how far it carries the complexity of nature beyond what is presented by the system of metamorphosis. And yet the metamorphoses which take place in such insects as the aphides, bees, wasps, ants, and termites, carry us to the very confines of alternate generation. Thus the wild bee which has been impregnated in autumn, and has afterwards sought a shelter to protect itself against the cold of winter, prepares a solitary habitation, in which it builds cells and deposits eggs; from the eggs proceed *larvæ*, but the bees into which these *larvæ* are metamorphosed are neuters, and all their faculties are directed to the assisting of the parent animal in the better nourishing of the future brood, and to the erection of a better habitation and cells, into which they convey the eggs of the queen-mother, and the food of the *larvæ* to be developed from them. Other cells, which contain a better sort of food, are erected for a later and less numerous progeny of eggs—namely, for *males*; and later still, others which are more roomy, and provided with the best food, but of which there are only a few, for fertile *females*. When all of these have come to maturity, and have performed their respective functions, the males die or are destroyed, the neuters also disappear, and the impregnated females alone survive the winter. Here, as in the case of the medusa, the neuter bee can scarcely be regarded as an individual existence, but merely as a step or stage towards the perfection of the males and females. Such gradations in being seem to point to an endless complexity in the system of nature; and yet the whole scheme, under the guidance of its omniscient Founder, goes on as smoothly as if it were composed of the plainest and simplest parts.

There is no one, therefore, who fully comprehends this discovery of alternating generations, but must be struck with the novel feature of variety, intricacy, and complexity which it confers on animated nature. *Cui bono?* asks the mere worldly utilitarian. To this end, responds the investigator—that the more we know, the more we wish and are fited to know; and that the more we learn of nature, the better do we understand our relation not only to its Creator, but to its scheme, of which we constitute, physically and morally, the most exalted section.

PRESENT AND FUTURE.

DISSATISFACTION with the *present*, and great expectations of the *future*, appear to be one of the most common follies of mankind. Every one is affected with it less or more; the young and middle-aged, however, much more strongly than the aged. Discontent is doubtless, on the whole, a useful element in our nature, for it prompts to better things; and it is only when it goes beyond the bounds of moderation, that it is seriously objectionable. The great error is, that people do not pursue their course of advancement with calmness; they forget to enjoy the advantages which they now possess; and while they look at the future, they neglect the present, forgetting that the present is the only real time. This error leads them into two follies: they believe that at some future period they will be happier than they are now, because they will then have at command means which are at present denied; and secondly, they fancy that people who follow a different mode of life are more favourably circumstanced than themselves. They seem to want a change.

I have heard men in business say, 'Ah, if I could devote my life to study, instead of grubbing here to get money, I should then be all right.' And, on the other hand, students are heard to say, 'After all, it is the man of business who really enjoys reading, when in his hours of relaxation he goes to his books as a relief. But it is odious to make your study a workshop.' Both parties are labouring under a kindred delusion.

And thus people go on; their energies are devoted to the attainment of some object, and 'if they can reach that, they will find repose.' The end is gained, but soon the object fails to satisfy; they miss the excitement which the chase afforded, and they must propose some new goal, or be wretched. For instance, there are hundreds of men now in England labouring to become rich, who really believe that if they were wealthy, and could spend their lives as others do who are in affluence, they would not have a care; and yet what a mass of error is contained in such an idea! It is far from true that their wealthy friends are perfectly happy; nor is it true that, if they possessed the same means, they would be one whit more contented; and, in the third place, as far as external goods are concerned, it is absolutely false that satisfaction is necessarily connected with them; for our comforts depend much more upon the state of our minds than we are willing to admit. As Iago says, 'Our bodies are our gardens, to which our wills are gardeners.' But we too often imagine that this garden will not flourish until we have surrounded it with costly marble, while we neglect to sow precious seed, and forget to uproot the weeds.

The men who place their hopes exclusively in the future, confess, by the very act, that they are incapable of enjoying the present (and by enjoyment much more is meant than the mere taking of pleasure); but not wishing to make this humiliating admission, they flatter themselves that something else than what they possess is essential to peace and comfort. This is nothing less than an excuse for want of contentment; because, when the object of search is attained, they are as far from what they really need as ever. He who does not begin by placing contentment as the basis of external goods, heaps up in vain, and might as well try to fill a sieve with water, as to construct a building of happiness upon a shadowy foundation.

Besides, a constant restlessness is the greatest possible hindrance to sound education of the mind. The feverish gaze of the fortune-seeker cannot look aright upon the beautiful creation which is around him, if it ever looks upon it at all. There are many men surrounded by the comforts of life, who, if you told them to divert their eyes a while from future prospects, to cease envying their associates, to admire the wonders of nature and the beautiful world we live in, to be rejoiced at the remembrance of their daily blessings, and to be fully satisfied with their numerous advantages, would put you down for a madman or a fool.

It is quite as easy to cultivate such a state of mind as to be constantly pining after what you have not got, or distressing yourself because you are not so well off as other people; and while every man of active mind must desire to go through his daily duties with energy and skill, and to fulfil his vocation with diligence, yet when he has done all this, calm contentment is one great means to make him happy, and keep him so. The poet Horace, when a young man, saw these important truths, and in his first satire lashes the folly of mankind in a very just and lively manner. That satire is not directed merely against avarice, as many critics have supposed, but against the deeper spirit of disquiet, which is at the root of all. I shall present the reader with a translation of some passages which bear more

particularly upon the question. He opens with an expression of wonder that mankind will persist in esteeming the fortunes of others more than their own, and shows that they neglect to take into account all the circumstances of the case; nay, farther, that if they were fairly brought to issue, and had their choice, they would be disposed to draw back, and keep their present station :—

How comes it, my Mæcenæ, that the lot
Which our own plans obtain, or chance presents,
Never contents us, but we always praise
Those who pursue a different course of life?
'How fortunate are merchants!' says the soldier,
Whose aged limbs are worn with early toil;
But yet the merchant, tossed by stormy seas,
Says, 'Warfare is far better. Why—they charge,
And in an hour comes death or victory.'
The lawyer thinks a country life the best,
When clients rouse him at the dawn of day.
The countryman, obliged to answer bail,
And to the city dragged from home, cries out
That they alone are blest who live in town.
But not to cite these numerous instances,
Near how I'll put the question. Let a god
Come down and say, 'I will do all you wish.
Soldier, be you a merchant; and be you
A countryman who were just now a lawyer.
Your lots thus changed, depart your several ways.'
How now—you stand? They will not move a step,
And yet they might be happy if they liked.

We may remark that Horace, with great truth, makes the various characters express discontent, and look with wistful eyes upon the condition of others, just when they feel any of the difficulties or inconveniences of their own stations press upon them. How interesting to observe the application to our own day of sentiments uttered in Latin verse eighteen hundred years ago! But the poet spoke the truth, and truth is eternal. Falshood alone perisheth.

He then goes on to notice the second great error, whereby a prudent regard to the future degenerates into neglect of the present, and a desire of pressing forward to something distant, while the day of fruition is constantly deferred. As an example of care in making provision, and good sense in enjoying that provision when the proper time comes, he instances the ant, who (according to the popular opinion) lays up her store for the dreary hours of winter; and he contrasts with her wisdom the conduct of those two-legged gatherers who are ever piling up and never distributing :—

They hope to find a safe retreat in age,
And have provision for their closing days;
Just as the little, labour-loving ant
Gathers what'er she can, and piles her heap,
Cautious and mindful of the time to come;
But when Aquarius, with his rainy storms,
Saddens the year, she never creeps abroad,
And sees what her patient care obtained.
While you cannot be moved from lust of gain
By summer's heat, or cold, fire, sea, or sword;
Nothing can stop you while you yet perceive
Another richer than yourself.

He thus states the common objects of our desires—the wish to have a retreat in age. There is no fault to be found with that desire in itself; but while we are procuring the means of living, we should also learn how to live, that when the one occupation has ceased, we may find resources in the other; that by studying the perfections of the Creator and his wonderful works, and by devoting ourselves to the general good of mankind, we may fulfil the greater and higher ends of our existence.

The poet then inveighs at some length against the folly of avarice, and asks, If you are satisfied with the little that nature requires, of what importance is it whether your granary contains a hundred measures of wheat or a thousand? He shows that the grasping spirit of covetousness is itself a curse; just as in the fable Tantalus is oppressed with thirst, though placed up to the chin in pure water, which, however, flies from his mouth every time that he attempts to drink. To illustrate the workings of a grasping spirit, he uses the following simile :—

Am, if you want to fill a single cup
With limpid water, and would rather drain

From a great river, than take just as much
At this small fount, it comes to pass that you,
So vainly pleased with superfluity,
Will by the rolling stream be carried off.
But he who seeks no more than what he needs,
Neither draws muddy water, nor his life
Loses imprudent in the dashing wave.
But most men, led astray by vain desires,
Say 'nothing is enough,' because our worth
Is measured by our wealth. What can you do
With people such as these? Let them remain
In misery, since they act thus by choice.

He then returns to his original point of attack—to the manner in which people compare themselves with others; for it is curious that, while you can find hundreds who distress themselves because they are not so surrounded by advantages as others are, you do not so often meet with those who look at the numbers less favoured than themselves; and yet there is no reason why we should not look on the one picture as well as on the other :—

But to return : should a man always praise
Those who pursue a different course of life?
Or should he pine because his neighbour's goat
Affords more milk than his, nor once contrast
The greater crowd far poorer than himself?
But rushing forward, labour to surpass
This one or that. He who thus hastens on,
Will always find one richer in his path :
As, when swift charioteers have left the bound,
Each strains to outdo the steeds that conquer him,
And ne'er vouchsafes a look on those behind.
On the whole, we rarely find a man to say
He has lived blissful, and who, at the last,
When he has passed the appointed term of life,
As a well-sated guest departs content.

It is very possible that the readers of Horace may flatter themselves upon having some valid excuse for neglecting to follow his advice, so difficult it is for men to stop in the chase and calmly consider their position. The seeker of wealth and the ardent lover of fame despise their quieter friends, and look with scorn upon the peace which they enjoy, nor will they admit the claims of contentment to their notice; yet the old English poet is quite correct in saying of the unambitious man—

Thus he is free from servile hands,
Of hope to rise, and fear to fall;
Lord of himself, though not of lands,
And having nothing, yet hath all.

No wonder that, when reverses come, the fortune-seeker is overwhelmed, and sometimes cannot rise again from his despair. How different would be man's condition and feelings were he to temper his desires, and restrain his expectations, within the bounds prescribed by a becoming spirit of piety and philosophy!

THE GOLD-MAKING DELUSION.

About five hundred years ago, an idea prevailed in Europe that certain base metals could be transmuted by a chemical process into gold. The pursuit of this chimera, called the 'Philosopher's Stone,' was carried to such lengths, that Pope John XXII issued a bull, condemning to perpetual imprisonment those who attempted to transform one metal into another. This was in 1317; but towards the close of the same century, so much had knowledge retrograded in high places, that our Henry IV. addressed letters-patent to the professors, nobles, and priests, inciting them to prosecute the search after the Philosopher's Stone, as a means of enabling him to pay the debts of the state.

The respect, however, which princes had for the ideal science did not extend to the persons of the adepts, who were laid hold of without ceremony, and compelled to labour at the projection. In a former article on this subject, there is a quotation from a work attributed to Michael Sandovigius; but this worthy is said, in an old 'Historie de la Philosophie Humetique,' to have appropriated an honour which did not justly belong to him. Both the real and supposititious writer of

the treatise, however, experienced very harsh treatment at the hands of the great. The true 'Cosmopolitan' (the literary name of the individual), according to our author, was Alexander Seaton, who possessed an estate somewhere on the coast of Scotland at the commencement of the seventeenth century. In 1602, while travelling for his pleasure in Holland, accompanied by his wife, he called on a Dutch gentleman whom he had treated with hospitality in his own country; and in the course of this intimacy, had the imprudence to exhibit his skill in the art of transmutation. He pursued his travels to Basle, and afterwards found himself in Saxony; and on his route, so frequently repeated the same indiscretion, that his reputation as a living treasure could not fail to reach the ducal court. The consequence was, that he was seized and shut up in a tower.

The Duke of Saxony attempted to work upon him, first by promises, then by threats, then by torture; but all in vain. The unfortunate alchemist submitted in silence; and after having repeatedly burned his flesh and dislocated his limbs, his persecutors at length gave up active measures in despair, and trusted to the effect of protracted confinement. Michael Sandovigius, who resided at Cracow, was then in Saxony; and being himself addicted to the dangerous pursuit, heard with great interest of the adventure of Seaton. He obtained admission to his prison, and formed a plan for his deliverance, which he ultimately effected by making his guards drunk. He carried him and his wife to Cracow, and then demanded, as the price of his service, to be initiated in the mystery of the Philosopher's Stone. But Seaton, showing him his emaciated body, his shrunk nerves, and powerless limbs, replied that all these things he had endured rather than disclose a secret he had won by study and prayer. He presented him, however, with a portion of the precious powder, by means of which, if we are to believe our author, and not by any scientific merit of his own, Sandovigius became famous as an alchemist. Seaton soon after died; and the persevering friend, thinking there might be some chemical virtue even in his widow, married her, and by this means became possessed of the treatise attributed to his own pen by the ignorance of the learned.

'It is impossible,' says our author, 'to find anything less suspicious or more precise than the adventure which occurred to M. Helvetius of the Hague, first physician to the Prince of Orange, and ancestor of the learned and virtuous Helvetius.' The circumstance is related by the doctor himself. On the 27th December 1666, he received a visit from a person unknown to him, who had the appearance of a respectable Dutch citizen, and whose visit was prompted by a desire the stranger had to remove his doubts, or rather disbelief, by showing him a portion of the actual Philosopher's Stone, and of the precious metal it had created. The one was in an ivory box, and in the form of three metallic lumps, of a sulphur colour; and the other was worn upon his stomach, in fine plates of gold, covered with mysterious inscriptions. Dr Helvetius examined attentively the contents of the ivory box, which the adept informed him were sufficient to produce twenty tons of gold; and on this boast, he thought it could hardly be a dishonesty worth mentioning to pinch silly off a little particle with his thumb-nail. It was in vain, however; but he solicited the adept to make the projection before him: the latter was satisfied with having convinced his eyes, and withdrew.

No sooner was his back turned, than the doctor sent for a crucible, and placing it eagerly on the fire, threw in a piece of lead, and when this was in fusion, projected (to use the proper Hermetic term) the stolen powder into the mass. The result was the instant evaporation of both lead and powder. The doctor was astonished; he thought he must have made some mistake in the manner of the projection; and when the adept returned

some time after to ascertain what impression he had made, he besought him earnestly to give him even the smallest possible portion of the powder. This request was complied with after some difficulty; but with the advice to cover the particle with wax before projection, otherwise the volatile nature of the substance would cause everything to evaporate. Helvetius did as he was directed. He projected the powder thus prepared into six drachms of lead—which he thus converted instantaneously into pure gold! This gold was so pure, that it had the power of transmuting silver; and the prejudices of Dr Helvetius being now completely removed, he published in the following year his '*Vitulus Aureus*,' in which the above incidents are related in full.

A circumstance is mentioned by Father Kircher in his '*Mundus Subterraneus*,' which may serve as a pendant to the above. About the time in which Helvetius was engaged in his experiments, another stranger called on one of the Jesuit's friends, who had been, ever since his youth, devoted to the Hermetic philosophy.

'I see,' said the visitor, 'by your crucibles and furnaces what you are about. But you have no chance—you will not succeed.'

'Assist me, then,' replied the alchemist eagerly. 'You who talk so decisively must have some knowledge of the matter. Instruct me, and I will obey.'

'Agreed,' said the unknown—'let us work together; but first take a pen, and write down the process as I describe it, that we may make no mistake.'

So said, so done. The process was fairly written out; and then, with the paper before them, they set to work, and the pupil at length poured with his own hands from the retort a very brilliant oil, which congealed into a mass, and was then reduced to powder. This powder was projected into three hundred pounds of quicksilver, which was straightway converted into gold, much purer than any that was ever dug from the bowels of the earth. At this result the adept was wild with joy, but the stranger looked calmly on, as if the affair had been a matter of no moment.

'You can do nothing for me,' he said in reply to his professions of gratitude and offers of service. 'I am travelling to and fro for my own amusement; and although I am always ready to aid when I see people at a loss, I want no assistance in return.' The other intreated him at least to stay with him that night; but he would not consent: he must betake himself at once to his inn, naming it, and go to bed.

In the morning the adept went to inquire for him, but he was not known at that inn, nor at any other in the town. No human being but himself had ever seen him; he had utterly vanished—exhaled—evaporated!

'No matter,' thought the adept. 'Since I have the process in black and white, it signifies little what has become of the man. Three hundred pounds of gold! that is worth at least a hundred thousand crowns. It is a large sum; but it is nothing to what I may—must—and shall have! Let me to work.' And so saying, he spread out the paper before him, and proceeded to the manufacture of the wonderful powder. But he was not as yet so skilful as his teacher, or he was more careless, and the experiment failed. But this was only his first trial alone, and with an untroubled brow he began anew. What should disturb him? He had plenty of money, abundance of time, and an indomitable—avarice. But his second experiment was not more successful, nor his third, nor his fourth. The directions were distinct, the writing was plain—the fault must be in himself. And so, when the hundred thousand crowns were expended, he sold his property, acre by acre, piece by piece, and only stopped when he had no longer a coin for the insatiate crucible. At that moment he was seized with a religious terror, and ran to the Jesuits, who soon explained to him that the stranger was no other than the *devil*! But many were of a different opinion; and Father Kircher's publication of the circumstances occasioned a literary contest, which raged for a considerable time.

It was supposed that the miraculous powder, if used in another way, would prolong life to an indefinite period; and both these superstitions were derived immediately by the Europeans from the Arabians, although the alchemists professed that Egypt was the fountain of the occult philosophy, which they termed Hermetic, after Hermes or Thoth. However this may be, the very same delusions were productive of much more remarkable disorders in China several centuries before the Christian era. There the infatuation of the princes in their search after the 'Waters of Immortality' and the Philosopher's Stone was frequently one of the leading causes of political revolutions; and it was not only the prodigal and depraved who were addicted to this fatal pursuit, but some of the wisest of the emperors. In Europe, however, alchemy, as the name implies, was merely an exalted chemistry, while in China it was the worship or propitiation of spirits. In the latter country it was believed that, in some distant islands (supposed to be Japan), where the people lived a thousand years, the waters of immortal life and boundless wealth were guarded by supernatural beings, and thither more than one deputation were sent by the credulous princes. The priests of Taou, being the great devil-worshippers, were of course the Chinese proprietors, so to speak, of this water, in which they succeeded in drowning the senses of so many of their imperial masters. In the year 133 before Christ, one of these mystics presented the emperor with the ingredients for composing the miraculous draught, telling him first to sacrifice to the spirits of the hearth, and then to throw some vermilion into the goblet, which would become gold, and this gold gave immortal life. The emperor brewed as he was directed, and drank; but feeling no stirrings of immortality within him, he took council of the other philosophers, who had each his own nostrum, consisting of particular sacrifices or temple-building. He tried them all by turns; till, every rite being performed, and every spirit propitiated, he was about to receive the reward of his magnificent labours. The goblet, however, was snatched from his lips by one of his indignant nobles, who drank off the draught. 'If I am immortal,' said he, 'your majesty cannot kill me; if I am not immortal, you will of course reward me for opening your eyes to so contemptible a delusion.'

Twenty years afterwards, when this emperor, it may be supposed, who lived and spent so fast, was still more in need of the Water of Immortality and the art of making gold, he fell as blindly into the snare. An adventurer offered to proceed to the islands of the Immortals, and kidnap one of the inhabitants for his service; on which the imperial dupe (who, by the way, was one of the most talented and energetic of the famous dynasty of Tsin) raised him to the dignity of prince, gave him his daughter in marriage, and sent him forth on his journey to the sea-coast, escorted by the most distinguished nobles of the court. These individuals were not so credulous as their master. They watched the sage narrowly, and on taking leave of him, despatched some trusty spies to hover in his rear. He was traced to a certain mountain with an unpronounceable name, where he was welcomed by a banditti of brother philosophers, and the whole made the welkin ring with their joyous carousals for three or four months, till it was time to return from the islands of the Immortals. One of the gang was made to personate the kidnapped native, and fully instructed in the art of making gold; and in due time the learned cortège arrived in great state at the palace—preceded some few days by the spies. They were received by the emperor and his court as became their dignity; and when they had told their tale, and exhibited their man, the headsmen, at a given signal, appeared upon the scene, and made them all immortal in a few minutes.

But to attempt to trace the Philosopher's Stone and Elixir Vitæ of Europe to Egypt, or China, or any other country, would be waste of time, for the superstition is part and parcel of human nature. In all ages the world

has run after some impossible good; and gold-making is one of the most widely diffused of its schemes, only because avarice is one of the most vulgar and universal of its passions.

SMALL COUNTRY PAPERS.

We have on divers occasions alluded to the rise in Scotland of small monthly papers, published at no higher price than a penny, and designed principally to furnish a channel for local advertisements. In towns not sufficiently populous to support a weekly newspaper, these minor publications are found to be of considerable use; and being acceptable to readers, they are increasing in number, as well as improving in the quality of their contents. Yet how unequal are the talent and tact with which they are conducted! Some abound in original articles on literary subjects, which must have cost no small degree of labour; while others are filled chiefly with extracts, and exhibit few signs of earnest industry. On the whole, however, these papers are respectably conducted; for we see in them no ministering to mean passions, and few transgressions on the score of taste.

It would, we think, materially increase the usefulness of this interesting class of periodicals if their conductors, who are, for the most part, literary amateurs, were to condense from the metropolitan and other prints, in an original and attractive way, notices of valuable improvements in the arts and discoveries in science; likewise accounts of manufactures springing up in obscure situations through the force of some solitary but energetic spirit—all with the view of imparting a mental stimulus to the neighbourhood. If there be a mechanics' institute, or a mutual improvement society, it should be invited to publish its proceedings in brief. Questions in mathematics and mechanical science should also find a place, in order to excite the minds of youth; and this, we observe, is done in one paper, 'The Alloa Advertiser.' Would not, likewise, a 'lady's corner,' with a few conundrums, help to make the little paper a welcome visitor at the farmers' firesides!

One of the latest competitors for public favour among the cheap country papers is one called by the odd name of 'The Pennyworth,' published at Arbroath. 'The Pennyworth' aspires to be more literary and original than most others of its class, and contains some writings which would by no means discredit periodicals of higher pretensions. We select the following little piece as a specimen:—

THE FUNERAL AT SEA.

Death had been for some days hourly looked for, and when the surgeon of the ship, who had been in close attendance on the sufferer, whispered to me that all was over, I felt in noway surprised. The little innocent, a beautiful boy of about four years old, was released from a world of sin and suffering. For weeks previous, the poor child had struggled against a disease which baffled medical skill. The devoted attention of two affectionate parents had been lavished on it in vain; and when the quiet spirit winged its flight to resume its place in another and a better world, I could not but regard the tiny body, beautiful as it was, otherwise than the prison-house of that soul which, after a brief but painful sojourn below, had ascended to the mansions of bliss, there to rest with its Father and its God. As I passed the cabin of its parents, when retiring to my own, the partially-suppressed sobbings of the mother were audible; and for some time after, the melancholy event having banished sleep, I could distinctly hear the sound of the father's voice as he slowly and solemnly prayed, that that Almighty Being who giveth and taketh away, would bend their hearts in submission to his will, and make them learn that it was good for them to be afflicted.

The father of the child thus early called to its account had, for a number of years, held a high civil appointment in the Bengal Presidency. His own health had suffered little from the effects of an eastern climate, but the decline of that of a beloved wife, and the alarming symptoms of early disease developed in his only and his dar-

ling boy, had induced him to forego all thoughts of remaining in India, and at once to give up an honourable and a lucrative situation for the sake of those with whose existence his own might be said to have been identified.

Though no uncommon circumstance during an India voyage, the death of a child, who had become an object of deep interest to all, caused a general gloom to prevail on board; and it was curious to remark how, even among the kind but light-hearted seamen, the striking event subdued for a time spirits prone to be merry rather than wise into a settled calm, contrasting strangely with the natural dispositions of the men. Our noble ship was an Indiaman of the largest class, and every convenience and luxury, everything that could minister to the comfort of the poor invalids, on whose shattered frames an eastern clime had done its work, were to be found within her. She was wending her way through the waste of waters, full of passengers, for 'merry England,' from the shores of which not a few of my companions had for many years been absent. The sallow faces and emaciated forms of some told of toil and suffering under a tropical sun; and as I gazed on one wretched invalid, whose once manly frame was now in the last state of exhaustion and atrophy, and saw him carried up from his cot by half-a-dozen of black servants, in order that he might enjoy the renovating influence of the cool evening breeze, I could not help thinking that the land to which his affections were turned would never see him alive. Nor was I wrong; he died on our entering the Channel, when within sight of his native county, the lovely Devonshire.

It was the day after that on which the child had expired, and at two o'clock, that was fixed on for its funeral. The necessary preparations had been completed during the night, and the mortal remains, shrouded in the garments of death, deposited in a plain but neatly-finished coffin, made by the ship's carpenter. This man had, for a number of years, been employed in India traders, and the manner in which he had executed the task assigned him, afforded melancholy proof of his experience in a calling which, properly speaking, was none of his. The faint breeze, which the officer on watch had whistled for during the night, and which had sprung up towards morning, died away almost altogether by twelve o'clock; and so clear was the firmament, in which a scorching and almost vertical sun blazed, and so limpid and still were the mighty waters, that, as I gazed on the scene, it required no great strength of fancy to believe that the sky and ocean were united, and that our huge and magnificent vessel had been, by some unknown agency, dragged from her natural position, and now hung midway between the heavens and the ocean.

The last sad ceremony—the committing of the body to the deep—was conducted with becoming solemnity. As is frequently the case on such occasions, letters of invitation to the funeral from the captain of the ship were sent to all the passengers, and, in consequence, every one capable of coming upon deck was present, dressed of course in the manner which such a ceremony required. The sailors, too, had received their instructions; and, equipped in their best clothes, and all clean and neat, arranged themselves on the deck according to their respective stations. The large watch-bell had continued to toll for about half an hour previous, a flag was hoisted half-mast high, and exactly at two o'clock the little coffin, across which the ship's colours were thrown, was carried out of the cabin by two of the seamen, who, followed by the captain and the passengers, slowly advanced to that part of the vessel at which the sad ceremony was to take place. One of the cannonades to leeward had been detached from its fastenings, and removed midships; and the top slip of the bulwark, immediately over the port-hole, being also removed, a considerable space was thus left open, near to which the coffin was placed. A commodious awning had been erected across a portion of the deck, and on the captain opening the prayer-book of the church of England for the purpose of reading the funeral service, every head became uncovered, while the most perfect silence prevailed. That beautiful and impressive service was delivered in a solemn and affecting

manner; and at that part of it when the body is committed to the dust, the coffin was gently raised, then slowly lowered over the vessel's side, and the rope by which it was held being detached, it, with its little occupant, sunk at once into the fathomless abyss. Two pieces of iron kentledge were fastened to the bottom of the coffin, so that it, with its light contents—for the poor child had been sadly wasted by suffering—were soon and for ever hid from sight.

That spectacle I shall not easily forget; it was a truly impressive and affecting one. Many an eye, 'albeit unused to the melting mood,' was bathed in tears, while the father, stout-hearted and manly as he had proved himself on many a trying occasion, was carried rather than led to his cabin. That noble heart strove with emotions which were ready to burst it: he wept not, he spoke not; but the sorrow, the heart-lacerating sorrow within, was too big for utterance.

I have watched over the bed of the dying, and beheld disease in its most appalling forms—I have seen it commit its ravages on the old, the young, and the lovely. I have gazed on the pallid cheek and the wasted form of consumption's victim—been present when, maddened by raging fever, reason had lost its sway—seen the sufferer in the last stage of that scourge of the East, Asiatic cholera, and beheld death doing its work promptly when hope beat high and fortune was most lavish of her gifts—have witnessed interments in many countries, and under many circumstances, but few occurrences have struck me more forcibly than the funeral of that poor infant. It was committed to the 'dark and deep blue ocean,' and 'sleeps well,' far from parents and from friends. The sea has entombed it, and the surge alone sings its requiem. No tears can bedew its grave—no tombstone nor inscription marks its resting-place. Its dust mingles not with that of its relations; it is apart from them—solitary—alone. The sea-bird screams, the wild wave roars, and the tempest howls its funeral dirge; and in lieu of the sweet flowers, emblems of its innocence, which, under other circumstances, would have bedecked its little grave, nought but the furious and the dashing billow is there.

There is something particularly striking and imposing in a funeral at sea. Those who have never witnessed can form no adequate idea of the sentiments it calls forth, and of the solemn associations it is so well calculated to awaken. There is something fearfully sublime in committing the body to the deep—something which makes the most inconsiderate reflect, and calls the attention of the most thoughtless. Funerals on land we are too apt to regard thoughtlessly, as every-day occurrences. We pass them heedlessly, as things of course, or follow the hearse, the nodding black plumes, and the other trappings of woe, as a form which the usages of society, and a proper respect for the departed, require of us. At sea it is different: there, away from everything that familiarises and too often sears the feelings to those sentiments which ought to affect, the melancholy ceremony strikes with irresistible force. Surrounded by the heaving billow, and in the midst of ocean's roar, the committing of a body to the deep is strikingly imposing and impressive, and cannot fail to remind us of our own insignificance, and the power of Him who can still its thunders and arrest its waves.

PUBLIC HEALTH.

It gives us pleasure to perceive that the subject of Public Health, to which we have frequently directed attention, is not losing any of its interest with the inhabitants of our larger towns—that section of the population to whom it is most immediately important. The members of the Liverpool Mechanics' Institution, it appears, have recently been favoured with a course of lectures on the subject by Dr Guy of King's College, London—a gentleman already well known by his efforts to improve the sanitary condition of the English metropolis. His remarks 'On the influence of trades and professions on the duration of life,' as given in the newspaper abstracts, contain some statistical information deserving of the widest circulation.

LONGEVITY.

Forming a sanitary scale for the higher classes, we have to place at the bottom of it, as having the shortest lives, the very class which, in every other respect, is raised so high above the common run of mankind—kings. Their lives are even shorter than the average of the great mass of their subjects. The average age at death of all the several classes dying, of 31 years and upwards, is as follows:—Kings of England, 59 years; members of royal houses, not being crowned heads, 64; members of the families of the peerage and baronetage, 67; English gentry, 70. The general opinion which prevailed of the longevity of the peerage and baronetage is decidedly erroneous. If we compare the aristocracy with the members of the several professions, we find them shorter-lived than the clergy, than physicians and surgeons, than barristers; they are also shorter-lived than literary and scientific men, than men engaged in the pursuits of trade and commerce, than officers in the navy; but they have a slight advantage over the officers of the army—a class which is largely recruited from the ranks of the aristocracy. Amongst the professions, the clergy rank first as being most healthy, next physicians and surgeons, and lastly lawyers; but the last two are nearly on a par. Are the aristocracy longer-lived than the working-classes? Ninety-nine out of a hundred would answer yes; but this, however, is very far from being the case. At 30 years of age, the aristocracy have an expectation of 31 years. The expectation for all England is upwards of 34 years, while that for the agricultural labourer is nearly 41 years. It is true there are many members of the aristocracy who live to a great age—so there are of all other classes; but the average, and not extremes, should be our guide. These results show that bodily labour is in the highest degree conducive to health. There are honourable exceptions, but the majority of the aristocracy of all countries yield to the temptations to bodily and mental inactivity, to sloth and luxury, which are so thickly scattered in their path, and the consequences are feeble health and short life. It is the chase, the struggle, the contest, the labour, which is the wholesome and the pleasant thing. Though possession is nine-tenths of the law, it is not a tithe of the pleasure or the profit of the effort by which it is obtained. Labour, then—the labour of the body in the greatest degree, mental exertion to a less extent—is one of the chief elements, indeed the chief element, of health and long life. Bodily labour in pure air is the combination which carries health and physical development to its highest pitch of perfection; and this is the fountain from which the community at large draw a perennial supply of strength and vigour. It is from the rural districts that the large towns draw their recruits to fill up the wide gaps which disease is always making in their ranks; and it was from the warriors of old that our noble families derived the vigour which has enabled them to continue through successive generations the possessors of hereditary rank and fortune. So, too, the rude health and vigour which exercise alone can produce is constantly forcing its way upwards from the lowest to the highest places in the social scale, to supply the waste of life which luxury is constantly making among the higher classes of the community.

TOWNS' PEOPLE.

Dr Guy next compares the three classes which may be said to make up the sum-total of our towns' population—namely, the gentry, including professional persons; the trading and mercantile class; and the operatives. Some time since, he had been at some pains to extract from the mortuary registers of the metropolis for the year 1839, the ages at death of the three classes of society—gentry, tradesmen, and operatives—dying aged 15 years and upwards; and he found, taking the average, that the gentry lived 59 years, the tradesmen lived only 49, and the labouring class 48; that was to say, the gentry live 11 years longer than the labouring population, and 10 years longer than tradesmen; and this, it should be recollected, in spite of the circumstance that the labouring classes, when favourably placed, live much longer than the higher classes. How unfavourable, then, to health and life must be the circumstances by which they are surrounded in our large towns, to give rise to so very great a disparity! Tables, carefully compiled, went to prove that the tradesman himself is shorter-lived than the working man by one or two years, and much shorter-lived than the members of the higher classes; but the families of tradesmen have some advantage over those of the working-classes. The lecturer confessed that,

for his part, he was not displeased with this result, for it might induce the middle classes to bring their influence to bear on the legislature to adopt sanitary measures for the good of themselves, their dependants, their workmen, and the nation at large. It was also satisfactory to observe that the lives of the higher classes were shortened, and their health impaired, in all those towns in which the other orders of the community are placed in unfavourable circumstances. The tradesman occupies an intermediate place, in a sanitary point of view, between those of the working-class who are employed out of doors and those who work in. In Leeds, the gentry live 44 years, the tradesmen 27, and operatives 19; in Preston, the gentry live 47 years, the tradesmen 32, and operatives 18; in Bolton, the ages for the three classes are 34 years, 23 years, and 18 years; in Manchester, the average age for the gentry is 38 years, for tradesmen 20 years, and for operatives 17 years. This was bad enough, but Liverpool was worse. Its gentry live on an average 35 years, its tradesmen 22, and its operatives (it scarcely seemed credible) 15 years! The average for the whole town is only 17 years, which is precisely the average for the operative class alone in the most unhealthy parish in London!

CONSUMPTION.

The three classes of society—gentry, tradesmen, and operatives—were then contrasted in reference to their liability to consumption. While 1 death out of every 6 occurring in the gentry, 15 years of age and upwards, was due to consumption, 1 out of every 3½ occurring among tradesmen of the same ages, and 1 out of every 3¼ occurring in the labouring class, is traceable to that cause. It was not uninteresting to observe also that consumption, when it does occur, takes place later in life among the gentry than among tradesmen, and later among tradesmen than among the operative and labouring class. Persons employed in-doors die earlier, attain a lower average age, are more liable to consumption (and those who die of it, die at an earlier age), than persons working in the open air. Some might perhaps be inclined to attribute this superior wholesomeness of out-door occupations not to the purer air, but to the exercise which often accompanied them; but that this was not the case, might be inferred from the circumstance, that the hawk, who sits or stands about in our streets and markets, and certainly uses quite as little exertion as the majority of persons employed within doors, enjoys the same comparative immunity from consumption, and this in spite of his constant exposure to one of its most exciting causes—cold. He had found, from experience, that the liability to consumption was inversely as to the amount of exertion; that consumption occurs earlier in sedentary employments than in those requiring more exertion; and in the latter, again, than in those requiring great exertion; that the deaths from all causes follow the same rule; and that the average age at death is lowest in the sedentary class. There was then abundant proof that in employments carried on in-doors, exercise has a most beneficial effect. This was illustrated by the case of the compositor and pressman. They both breathe the same kind of air, in rooms similarly constructed, warmed, and lighted; they resembled each other, in fact, in everything but the amount of exertion which they employ. A comparison gave the striking result, that while the compositor suffers from attacks of consumption in about 3¼ of all other diseases, the pressman is liable to only 1 in 5. Then the question suggested itself, Was exercise in all its degrees conducive to health? Could a man not use too much exertion? Undoubtedly he might. Too much exertion, like too little, tended to shorten life. The result of an accurate comparison which he had made was, that the average age of pressmen is 34 years, that of compositors 28. It was a fair inference, then, that the pressman lives on an average six years longer than the compositor; and yet it was a curious fact that the compositor attains, in rare instances, a much greater age than the pressman. Thus, while the oldest pressman whom he had found at work was 60, the oldest compositor was 72. This apparent anomaly was easily explained. Men who work hard, begin, towards 50 years of age, to suffer from diseases produced by over-exertion, which diseases, if they continue their employment, are sure to prove fatal before many years have passed; but, on the other hand, those who lead a sedentary life, having resisted the unwholesome influences to which they are exposed, continue to live on in the use of a degree of exertion quite compatible with diminished strength, and may attain a good old age. In conclusion, Dr Guy alluded to the relative amount of injury

from want of exercise and foul air. It was an acknowledged fact, that consumption could be produced in animals by confining them in a hot and foul atmosphere; which was equivalent to consigning human beings, and especially the young, to sedentary occupations in ill-ventilated workshops. The labourer at 80 years of age has an expectation of 4½ years; the clerk of only 27½ years—a difference of no less than 13 years: and does not this speak volumes in favour of air and exercise? and does it not force upon us the duty of striving, with all our might and means, to secure for the poorer inhabitants of large towns facilities for exercise and pure air, of which a long course of negligence has deprived them?

GAS-BURNING.

In the state in which it is commonly used, the gas consumed in our large towns is very far from pure—its disagreeable odour is evidence of this. But in its purest state, it creates a poisonous gas, which diffuses itself into the apartment where it is burned. This poisonous gas—carbonic acid—is the same that issues from the lungs of animals, and renders the air they have breathed unfit for the support of life. The carbonic acid gas thrown off by one gas-light of the ordinary size, is equal to the products of the respiration of three or four human beings. The use of gas within doors, without making any provision for carrying off the poisonous products of combustion, is one of those barbarisms with which, in these days of semi-civilisation, we are surrounded. Respiration being merely a process of combustion, and the human body a furnace of flesh, the products of respiration are the same as those of combustion, and the human body has the same effect on the air of an apartment as a gas-light or a furnace, and employing men in over-crowded apartments, without making provision for ventilation, is like filling a room with gas-light or charcoal choffers.

CAUSES OF DISEASE IN LARGE TOWNS.

Having stated that England is naturally the most healthy kingdom in Europe, the lecturer went on to show that the amount of disease which prevailed in large towns was not natural; and that it was to be attributed mainly, if not entirely, to the impurity of the air, caused by the dense clouds of smoke from chimneys, and the exhalations arising from refuse matter, slaughter-houses, gas-works, cess-pools, &c. &c. It could not be said that the habits of the population of large towns are not as good as those of the inhabitants of rural districts. Some part of the evil had been attributed to intemperance, but the large amount of mortality among children, who certainly are not the victims of intemperance, showed that this cause had little to do with it. Again, the excess of mortality in towns could not be attributed to low wages, or scanty food, or deficient clothing, or want of shelter from the weather. In all these respects the agricultural labourers were in a much worse position. All comparisons led to the same conclusion—that the excess of disease was mainly attributable to impure air. A large city, as things now were, was a huge manufactory of foul air, where disease was always busy, and pestilence never absent. What with the over-crowding of the inhabitants, the absence of efficient sewerage, the almost total want of ventilation of houses and workshops, the too prevalent use of stoves, added to the national horror of draughts, the air was rendered a subtle and deadly poison, of which the labouring-classes, and persons following sedentary occupations, were the first and most numerous victims. The remedies necessary for the removal of this evil were broad, straight thoroughfares, with here and there large open spaces; in other words, wide streets, and large squares and public gardens, conjoined with an abundant supply of pure water, efficient sewerage for the removal of dirty water and other refuse; and last, but not least, clean and well-aired habitations.

QUACK ADVERTISEMENTS.

In a late number of Blackwood's Magazine, appears a eulogy on the newspaper press of Great Britain not less eloquent than just. It is very true that this press is an honour to the country, if only for its abstinence from slander, ribaldry, and other ministrations to the meaner part of our nature; we can also prize its ceaseless vigilance in denouncing corruption, oppression, wickedness, and fraud, wherever they exist; nor can we withhold our admiration and wonder at the activity

manifested in the getting up of news—an activity which, in many cases, is restrained by no considerations of outlay or risk. With all these admissions, however, we can yet feel that the newspaper press, generally, is guilty of a delinquency which tarnishes its fair and honourable fame.

It will immediately occur to every one that we allude to the unscrupulous admission of advertisements of quack medicines and quack-medical books into the columns of our newspapers. The gross deception and falsehood, the scandalous impurity, not to say the revolting indecency, of these advertisements, ought assuredly, and at whatever pecuniary sacrifice, to prevent their circulation. Some newspapers there are which systematically, and on principle, repudiate this class of announcements; but these are intrepid and honourable exceptions to what would seem a universal rule. The *Lancet* the other day took occasion to allude to the subject, and disclosed some of the statistics, as well as injurious results, of these infamous advertisements.

For the purpose of scrutiny, we took five of these quack names [in London], and found that, on an average, three advertisements per diem appear in each of the seven daily papers; this makes twenty-one per day, or one hundred and twenty-six per week. The weekly journals of various kinds number nearly one hundred, and in one week these five advertisements appeared upwards of two hundred and fifty times. This was exclusive of magazines, monthlies, and quarterlies, with miscellaneous publications, and exclusive of the country newspapers, in nearly all of which the whole of these advertisements appear. Taking the advertisements from these sources altogether, they may be fairly computed at another two hundred and fifty. This would make for the five six hundred and twenty-six per week, or thirty-two thousand six hundred and fifty per annum! The advertisements are known to be lengthy, and a respectable news-agent whom we applied to, assured us they could not cost less than 10s. each. This calculation gives upwards of £16,000 a-year as the expenditure of these five quacks in advertising alone!* These persons live in expensive houses, and it is not unusual to see them calling in their carriages with advertisements at the newspaper offices, so that their entire incomes must be enormous, and all filched from the profession in cases of real illness, or extorted from the public where disease is only fancied!

These quacks greatly affect religious and well-reputed publications; it gives them, as it were, character to appear constantly in these pages. With a keen eye to business, they are also delighted at having a next-door advertisement to a respectable book. They are, it is true, generally consigned to the bottom of the page; but as newspapers cannot draw a quarantine quite round them, some one or other must daily see their works advertised in contact with these abominations. This is a point worth the notice of those papers who will continue to circulate the pestilent humbug. They should, at least, place blocks of non-conducting puffs between them and the better sort of advertisements.

We have said they greatly value the religious publications; they are now kicked out of nearly all the weekly newspapers of this class. Some, however, there are where Mammon prevails over decency.

Enormous as are the sums spent in advertising, they would be much greater but for a system which obtains in the provinces of compounding for payment. These people are permitted to send down to country papers a quantity of their books and medicines with their advertisements; the books and medicines are sold at the newspaper office, or by some druggist or stationer in the neighbourhood, and the puffs are paid for out of the proceeds. In this way it is, or by direct payment, that in almost every provincial journal in the kingdom,

* As we observe that the same quack advertisements regularly appear in the colonial papers, this sum must be considerably understated.—ED. C. H. J.

the physical results of human iniquity are blazoned forth with all that prominence of type-setting of which George Robins was the proud inventor. This will scarcely be believed of such a class of men as provincial newspaper editors, publishers, and proprietors. But the fact is so.

'One might pursue these creatures through the deceptions of their disgusting traffic, but the task is irksome, and we will add but one or two more glaring instances. Doubtless respectable readers are startled to see critiques of books of this class advertised, purporting to come from respectable papers.' But often the names of fictitious newspapers are employed; and so likewise are the names of respectable medical men simulated, as guaranteeing cures. 'Somewhat remains to be said about the more immediate depredations of these wretches upon the poor flies who become entangled in their webs. Like Peter Schlemihl's fiend, they hold him firmly if they have but his shadow in their grasp, and in most instances the price of silence is paid. We have known them reduce their dupes to beggary and to the madhouse.

'The whole question has its bearing on the medical profession, and forcibly urges the necessity of defending the faculty and the public from quackery by legal enactments; but it has, too, a still more important relation to public and social morality. It can scarcely be wondered at, when the young and the ignorant are exposed to the continual taint of these purient advertisements—when the disgusting anatomy of vice is everywhere paraded with but the flimsiest covering—and the very debris of the grossest of our animal passions are thrust before the pure and the impure alike, irrespective of either sex or age. It is impossible that the continued exposure of such things to the curiosity of young people can be without a baleful effect. We are persuaded that they are a prolific source of the evils they falsely profess to remedy. The fabric we have attempted to expose, based as it is on lying, fraud, and every imaginable form of deceit, must be brought to the ground. We commend the subject to all those who desire to act as conservators of public morals; but, above all, the bringing public opinion to bear upon its indirect supporters is what we would aim at. Public opinion is the great licitor, and never were the axe and the fasces more imperatively required.'

Cordially uniting in these strictures, we would respectfully represent to our fellow-labourers of the press, that in giving publicity to such advertisements, they not only do a positive injury to society, but neutralise the good they then but attempt to effect. Virtue in one column is balanced by vice in another. Their generous diatribes against political venality and private profligacy, can have little effect when placed in such odious juxtaposition. Even their law and police reports, which so frequently hold up dishonesty and indecency to reprobation, can hardly be expected to deter those who see dishonesty and indecency countenanced and abetted in the next page. That proprietors and editors are generally men of honour, is perfectly true; and that is just the reason why we think a kindly-meant remonstrance such as this will have due effect with the really respectable journals, and induce them to leave such nauseous advertisements to others—if such be—which even they will not contaminate.

THE CONSEQUENCES OF SMOKING.

The wide-spread habit of smoking has not yet had due medical attention paid to it and its consequences. It is only by two or three years' observations that Dr Laycock had become fully aware of the great changes induced in the system by the abuse of tobacco, and of the varied and obscure forms of disease to which especially excessive smoking gave origin. He proceeded to state some of them as they were met with in the pharyngeal mucous membrane, the stomach, the lungs, the heart, the brain, and the nervous system. The tobacco consumed by habitual smokers varied from half an ounce to twelve ounces per week; the

usual quantity from two to three ounces. Inveterate cigar smokers will consume from four to five dozen per week. The first morbid result is an inflammatory condition of the mucous membrane of the lips and tongue; then the tonsils and pharynx suffer—the mucous membrane becoming dry and congested. If the thorax be examined well, it will be found slightly swollen, with congested veins meandering over the surface, and here and there a streak of mucus. Action ascends upwards into the posterior nares. The eye becomes affected with heat, slight redness, lachrymation, and a peculiar spasmodic action of the orbicularis muscle, experienced with intolerance of light on awaking in the morning. The frontal sinuses do not escape, but there is a heavy dull ache in their region. Descending down the alimentary canal, we come to the stomach, where the results in extreme cases are symptoms of gastritis. Pain, tenderness, and a constant sensation of sickness, and desire to expectorate, belong to this affection. The action of the heart and lungs is impaired by the influence of the narcotic on the nervous system; but a morbid state of the larynx, trachea, and lungs results from the direct action of the smoke. The voice is observed to be rendered hoarser, and with a deeper tone. Sometimes a short cough results, and a case of ulceration in the cartilages of the larynx came under the doctor's notice. The patient was such a slave to the habit, that he hardly ever had the pipe out of his mouth. Similar sufferings have been caused by similar practices in other instances. Another form is a slight tickling, low down in the pharynx or trachea, and the patient coughs, or rather hawks up, a grumous-looking blood. It is so alarming, as to be mistaken for pulmonary hæmoptysis. The action of tobacco-smoking on the heart is depressing; and some individuals who feel it in this organ more than others, complain of an uneasy sensation about the left nipple—a distressing feeling, not amounting to faintness, but allied to it. The action of the heart is observed to be feeble and irregular. An uneasy feeling is also experienced in or beneath the pectoral muscles, and oftener on the right side than on the left. On the brain the use of tobacco appears to diminish the rapidity of cerebral action, and check the flow of ideas through the mind. It differs from opium and henbane, and rather excites to wakefulness, like green tea, than composes to sleep; induces a dreaminess which leaves no impression on the memory, leaving a great susceptibility, indicated by a trembling of the hands and irritability of temper. Such are secondary results of smoking; so are blackness of teeth and gum-bolls. There is also a sallow paleness of the complexion, an irresoluteness of disposition, a want of life and energy, and, in constant smokers who do not drink, a tendency to pulmonary phthisis. Dr Wright of Birmingham, in a communication to the author, fully corroborates his opinions; and both agree that smoking produces gastric disorders, coughs, and inflammatory affections of the larynx and pharynx; diseases of the heart, and lowness of the spirits; and, in short, is very injurious to the respiratory, circulating, alimentary, and nervous systems.—*Literary Gazette.*

A HINDOO GENIUS.

A native of Calcutta, by hereditary profession a blacksmith, who was employed for many years in cutting punches for this press, having now little occupation, has adopted the following ingenious mode of obtaining a livelihood:—He has manufactured an iron press upon the model of one of those in use here, and set up a printing-office, at which he has commenced printing for the country at large. Last year he printed a native almanac of a superior character, which had a remarkable run. Soon after this he began to engrave on lead pictures of the gods and goddesses of the Hindoo Pantheon, of which hundreds of thousands were struck off on inferior paper, and obtained a ready sale. Some of them were afterwards adorned by the art of the limner, and being set in frames, sold of course for a higher price. Hawkers were employed in traversing the country with packs of these mythological prints, both on account of our Serampore printer, and others who soon found it advantageous to imitate his example in Calcutta. Hence there are few villages to be found in a circle of many miles round the country in which the cottages of perhaps the poorest individual is not supplied with the veritable effigy of some one of the popular gods. The supply, however, soon became too great for the demand, and his competitors relinquished the trade, which has since languished, and is now confined to a very limited extent.

But his ingenuity was not exhausted. He determined to print English books for the numerous youths of the poorer classes, who are now endeavouring to obtain a smattering of our tongue, and for whom even the low-priced elementary works of the Calcutta School-Book Society are too high. Of these works, thousands of pirated copies have been printed in Calcutta, and disseminated through the country. But the individual we allude to, finding English type, at second-hand, too dear for his purpose, has cut a set of punches for himself, and cast the types which he employs for this work. They are entirely wanting in that beauty and exquisite accuracy which characterise our English types, but to an inexperienced eye the difference between them and letters cast in Europe or America would scarcely be apparent; and to a native, the inferiority would be altogether imperceptible. Thus furnished by his own ingenuity with the whole apparatus of a typographical establishment, he is enabled to produce works at so cheap a rate, as completely to undersell the presses in Calcutta. The native booksellers in that city, a rising race, though at present of little note, are happy to avail themselves of his labours, and purchase edition after edition of his Cheap Books. As soon as education in the vernacular language becomes the order of the day, it is by such men and such means that books will be multiplied. Capital will be poured in upon the enterprise; the natives who are acquainted both with English and Bengalee will find it to their advantage to cater for the press, and the means of improvement will be placed within the reach of the middling and lower classes of society.—*Indian paper.*

RICHTER'S PLAN OF SELF-EDUCATION.

The rules he laid down for himself in the work of self-education are worthy of special notice. First, since life is short in comparison with the work to be accomplished, he aimed at introducing a just economy through all his employments, resolving that, as far as possible, neither his time nor his labour should be without its use. The present was so to be managed, that he might fairly look to the future for payment of interest, increasing after a compound ratio. He sought for mental food in four principal fields—human life; the works of nature; the 'substantial, pure, and good' world of books; and last, but before all the rest, patient reflection. One-half of the day was given to writing; the other half was devoted to exercise in the open air, and to thinking. Like our own Wordsworth, he loved the fair face of Nature, and spent many hours daily in the contemplation of her charms, feeling, as he stepped into the free air, as if he were entering some mighty temple. In prosecuting his plan of noting, he formed a series of handbooks of various branches of science; and in one of these—indorsed 'Nature'—he entered all the examples that fell within his notice of a superior contriving mind; in short, he made a handbook of natural theology. As he conceived the scheme of any new work, he sketched an outline of the story and the characters, with some of the thoughts to be worked out, just in the way that a painter makes studies for any great design. Such a book was marked 'Quarry.' His 'Quarry for Titan' was found to occupy seventy closely-printed pages. Perceiving, as all great artists must do, the value of a command over language, he was at great pains to mark the various meanings of which words are susceptible. He commenced a dictionary of synonymes, to which he never afterwards ceased adding. Of one word he actually discovered two hundred nice shades of signification.—*Monthly Prize Essays.*

THE VALUE OF A DEAD HORSE IN PARIS.

After the horses are deposited, the hair of the mane and tail is cut off, which amounts to about a quarter of a pound; the skin is then taken away, which is disposed of to tanners, and used for various purposes; the shoes are sold as old iron; the feet are cut off, dried, and beaten, in order to make the hoofs come away, or are left to putrefy till they separate of themselves, when they are sold to turners, combmakers, manufacturers of ammonia and Prussian blue. Every morsel of fat is picked out and melted, and used for burning by makers of enamel and glass-toys, greasing shoe-leather and harness, and manufacturing soap and gas. The workmen choose the best pieces of the flesh to eat, preferring those about the head, and sell the rest for dogs, cats, hogs, and poultry. It is also much used for manure and making Prussian blue. The bones are disposed of to cutlers, fan-makers, &c. and often made into

ivory-black; and also occasionally serve as fuel for melting the fat, and for manure. The sinews and tendons are sold to glue-makers; the small intestines are made into coarse strings for lathes, &c. or serve as manure.

SONNET.

I DREAMED—I saw a little rosy child,
With flaxen ringlets, in a garden playing;
Now stopping here, and then afar off straying,
As dower or butterfly his feet beguiled.
'Twas changed—one summer's day I stepped aside,
To let him pass: his face had manhood's seeming;
And that full eye of blue was fondly beaming
On a fair maiden, whom he called 'his bride!'
Once more—'twas evening, and the cheerful fire
I saw a group of youthful forms surrounding;
The room with harmless pleasantry resounding;
And in the midst I marked the smiling stre.
The heavens were clouded! and I heard the tone
Of a slow-moving bell: the white-haired man was gone!

—*Old Journal.*

STRENGTHENING PROPERTIES OF TEA.

At the public meeting in this town, to promote a reduction of the duty on tea, Mr Martyn J. Roberts referred to the physical condition of the inhabitants of the Channel Islands, whose consumption of this article exceeds that of the people of England in about the proportion of 3 to 1, and to the published opinion of Professor Liebig, in proof that tea is a strengthening rather than a debilitating beverage, if used with moderation. During the week, we have learned from an eminent linguist and professor of the United States, that the most able medical men of that country entirely concur in the opinion. This gentleman also stated a fact from his own knowledge which is worth being recorded. A literary friend of his, under the conviction produced by certain statements which he had read and heard, that tea was injurious, resolved to abstain from it. He continued this abstinence for a year, during which time, instead of finding benefit from the change, he experienced a want of tone which surprised and mortified him. At the end of the year he resolved to try whether this arose from his abstinence from tea; he resumed its use, and soon had the gratification to feel a return of the healthful sensations which he had enjoyed previous to the abandonment of this cheering beverage.—*Leeds Mercury.*

TOO MUCH ANXIETY.

Of the causes of disease, anxiety of mind is one of the most frequent and important. When we walk the streets of large commercial towns, we can scarcely fail to remark the hurried gait and careworn features of the well-dressed passengers. Some young men, indeed, we may see with countenances possessing natural cheerfulness and colour; but these appearances rarely survive the age of manhood. Cuvier closes an eloquent description of animal existence and change with the conclusion that 'life is a state of force.' What he would urge in a physical view, we may more strongly urge in a moral. Civilisation has changed our character of mind as well as of body. We live in a state of unnatural excitement; because it is partial, irregular, and excessive. Our muscles waste for want of action; our nervous system is worn out by excess of action. Vital energy is drawn from the operations for which nature designed it, and devoted to operations which it never contemplated.—*Thackeray.*

EFFECT OF LIGHT UPON HEALTH.

There is a marked difference in the healthiness of houses, according to their aspect in regard to the sun. Those are decidedly the healthiest, other things being equal, in which all rooms are, during some part of the day, fully exposed to direct light. It is well known that epidemics attack the inhabitants of the shady side of a street, and totally exempt those of the other side.—*Dr Moore.*

JOHNSON AND SAVAGE.

RICHARD SAVAGE serves in England as the type of a wretched man of letters; not that he was singular in this respect, but that the friendship of Johnson has caused the particulars of his life and habits to be recorded with more than usual minuteness. His biography by the great lexicographer is still in some repute; more read, as well as more praised, than any other of its author's productions of that class. I was lately surprised, however, on an accidental re-perusal of it, after an interval of many years, to find so much in this narrative that appeared to me unsatisfactory. I shall endeavour, though it is almost like broaching a heresy, to show wherein I think it defective.

Savage, as is well known, came into the world (1697) under peculiar circumstances. In order to be divorced from a husband with whom she lived unhappily, the Countess of Macclesfield told a tale of infamy against herself. Her child, born soon after, and who otherwise would have been in time an English peer, was reared at a distance from her, in obscurity, and under strict care that he should never know his real origin. He received, nevertheless, a good education at a private school. It was while serving as apprentice to a shoemaker, that he discovered by accident that he had received his birth, not from the poor woman who had reared him, but from a lady of brilliant rank, who lived in affluence in the west end of London. Curiosity, ambition, perhaps some working of the natural affections, then led him to make an effort to see his real parent; but she never could be induced to grant him an interview. The poor youth used to watch whole evenings in front of her elegant mansion, that he might have the chance of seeing her go out or in, or pass through her lighted apartments; but in vain. Rendered desperate at length, he tried on one occasion to force his way into the house. She either affected or felt alarm at the proceeding, screamed to alarm her servants and neighbours, and poor Savage was thrust into the street without accomplishing his object. So far from affording him any countenance or kindly support, she attempted to get him kidnapped and sent away as a slave to the colonies. Johnson tells these and many other particulars of the conduct of this unnatural mother, but leaves her to be regarded as a mere anomaly or monster in human form. It is, however, always desirable to see motives or prompting causes for any extraordinary actions; and it seems strange that Johnson should have been unable to conjecture why this mother acted differently from her sex in general. It does not now seem difficult to suppose that the countess regarded her child, from the first, as a memento of painful circumstances in her own life, and shrunk from seeing a being invested with such distressing associations. She might think it better for him to regard

himself as of humble, than of infamous extraction. When he afterwards became troublesome to her, and likely to revive her sad story before the world, she might be driven, in a paroxysm of selfish feeling, to wish him out of the country. This is not to excuse the unhappy woman; it is only an attempt to detect the workings of natural passions in her bosom as a cause for her actions. We must at the same time, in simple justice, keep in mind that the whole story has been handed down to us by the enemies of the countess.

Savage, when he learned what he really was, worked no more. He had education and abilities which were enough in themselves to have put him above a humble trade. Ambition and love of self-indulgence now determined him into that false position which, with his own bad passions, was the cause of his misery through life. With an excuse for considering himself unfortunate, and constant hopes of *something being done for him* on that account, he put common means of livelihood out of consideration. Sir Richard Steele took him by the hand—a bad Mentor, though a kindly and well-meaning one. Under his care, Savage began, before twenty, to write poems and plays. When, in consequence of ridiculing his patron behind his back, he lost his friendship, Mrs Oldfield the actress became his friend, and agreed, from pure generosity, to give him fifty pounds a-year till he should be better provided for. The beneficence of these amiable people is praised by Johnson, without his seeing that it must have fatally encouraged Savage in the irresponsibility he felt with regard to his own support. On giving proof of his abilities by a play on the story of Sir Thomas Overbury, many other persons of eminence became his friends; and he realised a hundred pounds by the work when published, ten guineas being derived from its dedication to a man of fortune. The story of the young poet was now known. Unluckily, his friends encouraged him in a disposition to trade upon it, by way of making up for the heartlessness of his mother, and as a kind of revenge against her. When it was narrated by a friend in a periodical publication of the day, with a request that persons commiserating the hero should send contributions for him to Button's Coffeehouse, seventy guineas were deposited there in the course of a few days. A duke remarked that Savage should be looked upon as an injured nobleman, and supported accordingly by his own class. The biographer tells all this, but makes no remark on the possibility of his hero maintaining a truer dignity by supporting himself, and sinking the birth which could reflect upon him no honour.

Supported chiefly by the bounty of others, and making a very imprudent use of any resources of his own, Savage advanced to thirty years of age, when he was tried for murder. He and two friends, having sat up till midnight drinking, went into a house of ill fame at

Charing Cross, and stumbled into an apartment already occupied by a party. One of Savage's friends chose deliberately to commence a quarrel with these people, by kicking over their table. In the confused contest which ensued, Savage wounded a Mr Sinclair in such a way that he died next day. A more wanton piece of mischief than the whole conduct of Savage's party could not have been exhibited. Savage was condemned to be executed. A pardon was interceded for, and, *notwithstanding opposition from his mother*, obtained. It certainly was right that he should not have suffered for murder; but it seems equally clear that a free pardon was a great stretch of mercy in a case of such culpable homicide. Yet strange to say, Johnson presumes that 'his memory may not be much sullied by his trial,' as if it was enough that he had not killed a fellow-creature out of deliberate malice. One can go along with the biographer in a more placid humour when he relates a subsequent act of his hero. 'Some time after he had obtained his liberty, he met in the street the woman who had sworn with so much malignity against him. She informed him that she was in distress, and, with a degree of confidence not easily attainable, desired him to relieve her. He, instead of insulting her misery, and taking pleasure in the calamities of one who had brought his life into danger, reproved her gently for her perjury, and changing the only guinea that he had, divided it equally between her and himself.' Johnson adds, 'Compassion was the distinguishing quality of Savage; he never appeared inclined to take advantage of weakness, to attack the defenceless, or to press upon the falling; whoever was distressed, was certain at least of his good wishes; and when he could give no assistance to extricate them from misfortunes, he endeavoured to soothe them by sympathy and tenderness.' The partial biographer at the same time admits that he was implacable in resentment where his pity was not appealed to.

Savage continued for some time to live as he had done before—indebted to the accident of the day for his subsistence, sometimes deriving a little money from his writings or a theatre benefit; at others treated by his friends in taverns; and often retiring from a gay company, whom he had entertained by his wit, to wander, solitary and homeless, through the streets. In Johnson's strong phrase, 'he spent his life between want and plenty—between beggary and extravagance.' What he had, he was tempted to spend foolishly, 'because he always hoped to be immediately supplied.' He would 'purchase the luxury of a single night by the anguish of cold and hunger for a week.' The biographer blames for this the conduct of his friends in treating him at taverns. It does not seem to have occurred to him that the treated party had a power of declining this degradation, and that honest men choose to live otherwise. Yet Savage became anxious for a settled income, and, after all the cruelty of his mother, attempted to extort a provision from her by threatening to harass her with lampoons. Johnson triumphs in the partial success of this expedient; of its essential unworthiness he says not one word. In consequence of Savage's application, Lord Tyrconnel, a friend of the countess, agreed to receive him into his house, and, besides supporting him, give him an allowance of two hundred per annum. He now lived at a regular and luxurious table, with a nobleman, to enjoy whose conversation was, he himself says, 'to be elegantly introduced into the most instructive as well as entertaining parts of literature—to receive from the most unassuming and winning candour the worthiest and most polite maxims.' Here he finished

his longest poem, the *Wanderer*, the copyright of which he sold for ten pounds, because he wanted some trifling gratification which this sum could purchase, and because this was the first offer! Dressing handsomely, living as a kind of unfortunate nobleman, and possessed of literary fame and attractive conversational powers, he was now highly popular. 'To admire Mr Savage was a proof of discernment; to be acquainted with him was a title to poetical reputation. His presence was sufficient to make any place of public entertainment popular; and his approbation and example constituted the fashion. So powerful,' says Johnson, 'is genius when it is invested with the glitter of affluence!' A man of independent mind will of course see that it was not a situation fit to secure real happiness. It was but a gilded servitude at the best, with only one redeeming circumstance for a man of letters—that it afforded opportunities for quiet study, and for the observation of some departments of society not usually very patent to inspection. But if there was anything in it which a virtuous and unassuming student could have profited by, or by which such a person could have made it tolerable, that person was not Richard Savage.

During this externally brilliant period of his life, he published a poem in praise of Sir Robert Walpole, the then all-powerful minister. Its encomiums are in the style of the dedications of that age, although the poet boldly asserts that truth is his sole guide. Now, Johnson quietly tells us that Savage was in the custom of privately speaking of Walpole in a very contemptuous manner. But Walpole sent the poet twenty pounds for his panegyric, and was no doubt expected to send that or something more; and Lord Tyrconnel required his protégé, 'not without menaces,' to write in praise of his leader. In the eyes of the great English moralist, it was all owing to the dependent state of Savage, and this dependence was his misfortune, so that circumstances alone were blameable! The utmost that Johnson can admit is, that 'if his miseries were sometimes the consequences of his faults, he ought not yet to be wholly excluded from compassion, because his faults were very often the effect of his misfortunes'—as if Savage had been under some moral prohibition to work honestly, as other men do, for his own bread! What crime is there for which some such excuse could not be made?

In no long time—we are not exactly informed how long—Lord Tyrconnel discharged Savage from his house, alleging reasons in the poet's own misconduct. Savage, his lordship said, was accustomed to enter taverns with any company that proposed it; there he would drink the most expensive wines with great profusion, and when the reckoning came, he was without money. When his friends paid his share grudgingly, he brought them to Lord Tyrconnel's, where he would entertain them with wines from his lordship's cellars, and disgrace the house with riot and outrage. A set of valuable books which he had bestowed upon Savage, stamped with his arms, he had the mortification to find on stalls exposed to sale, it being Savage's custom, when he wanted a small sum, to take his books to the pawnbroker. On the other hand, the poet alleged that a shabby desire to escape the expense which he occasioned, was Lord Tyrconnel's motive for sending him adrift. The reasons assigned by Lord Tyrconnel agreeing so well with the ordinary habits of Savage, as admitted by Johnson, we may well believe them to have been in the main true. Undoubtedly the gist of the whole matter is, that Savage's recklessly dissolute conduct was incom-

patible with the comfort of a sober gentleman's mansion. Yet still there is nothing from the moralist but pity. It has since become known that Savage wrote to Lord Tyroconnel's chaplain, representing his deplorable situation, and petitioning his intercession, in order that he might be taken back. This deprives Savage, of course, of all right to allege faults on his lordship's side. The case had been simply this—an undeserved bounty forfeited by the guilty folly of the receiver.

It was soon after this period that Savage published his most celebrated poem, the *Bastard*, which he dedicated, 'with all due reverence,' to Mrs Brett—such being now the appellation of his mother, in consequence of her having married a gentleman of that name. The piece contains many striking lines, and as it related to his own story, now a pretty notorious one, it met a large sale. Johnson informs us that it had the effect of driving the poet's mother away from Bath, where she was living at the time. The biographer manifestly rejoices in this poem. He quotes, as an apology for Savage, the lines—

No mother's care
Shielded my infant innocence with prayer:
No father's guardian hand my youth maintained,
Called forth my virtues, or from vice restrained.

The grossness of the whole matter, the writing of such a piece, and the publishing of it, is unperceived by Johnson. He sees not the ludicrousness of an able, well-educated man of between thirty and forty whining about the hardships of such a peculiar orphanhood. He sees not the utter folly of palliating a homicide committed in a drunken brawl, by reference to any external circumstance whatever. Only one general remark of the nature which justice would require, does he make about this part of Savage's life, where he says, 'By imputing none of his miseries to himself, he continued to act upon the same principles, and to follow the same path; was never made wiser by his sufferings, nor preserved by one misfortune from falling into another.' The fact is, that Johnson himself continually refers Savage's misfortunes, as well as his faults, to others, and but faintly in any case blames the sufferer. To show the mistaking spirit in which he writes, take his remarks on the queen's bounty, in allowing Savage fifty pounds a-year, in requital for a little complimentary poem which he sent annually on her birth-day, under the character of the Volunteer Laureate. Caroline, with her characteristic goodness, had permitted Savage to send such a poem. Let any one look at the verses, and then say if her majesty could have had any motive but to befriend one whom she believed to be an unfortunate man of genius. The very first ode, which led to the arrangement, is little but a new deploration on the hackneyed story of his birth. Yet what says Samuel? Her majesty's reception of the poem, 'though by no means unkind, was yet not in the highest degree generous: to chain down the genius of the writer to an annual panegyric, showed in the queen too much desire of hearing her own praises, and a greater regard to herself than to him on whom her bounty was conferred!' Was there ever such miserable drivell as this? though it be a bold word to use towards Johnson. And this writer almost immediately after tells us, without a word of comment, how the wretched volunteer laureate used annually to retire with his fifty pounds to spend it in obscure sensuality, reappearing after a brief space as penurious as usual—for 'Mr Savage had never been accustomed to dismiss any of his appetites without the gratification which they solicited,' and 'nothing but want of money withheld him from partaking of every pleasure which fell within his view!' What on earth is this but the very wantonness of prejudice and partiality?

After he had endured some years of penury, a few friends solicited Sir Robert Walpole in his behalf, and obtained a promise of a place for him; but the promise was never fulfilled. It is easy, of course, to see how the minister might pause before trusting any

public function to such a man as Savage; but Johnson sees nothing of the kind. He can only complain that a man of genius should not be supported by some means not of his own earning. The biographer loudly asserts the dignity of many of his friend's sentiments: he loved goodness, it seems, though he did not practise it. He was also inspired by religious sentiments; and at one time contemplated a poem in which the freethinker should be shown going through all the stages of vice and folly, till dismissed from the world by his own hand. Strange that Samuel Johnson should have failed to perceive how little worth is to be attached to such an idea, when he is himself delineating a man of contrary principles, who, nevertheless, goes through that very career in sad reality, excepting only the last particular. Savage was now living a half-outcast life, 'eating only when he was invited to the tables of his acquaintances, from which the meanness of his dress often excluded him.' 'Sometimes he passed the night in mean houses, which are set open at night to any casual wanderers; sometimes in cellars, among the riot and filth of the meanest and most profligate of the rabble; sometimes, when he had not money to support the expenses of even these receptacles, he walked about the streets till he was weary, and lay down in the summer upon a balk, or in the winter, with his associates in poverty, among the ashes of a glass-house.' In such places 'was to be found the man of exalted sentiments, extensive views, and curious observations; the man whose remarks on life might have assisted the statesman, whose ideas of virtue might have enlightened the moralist, whose eloquence might have influenced senates, and whose delicacy might have polished courts.' Nothing of the kind, I venture to say. The balk and the glass-house never received any such tenant; they only sheltered an unreflecting sensualist and profligate. That any sensible man should have ever seriously spoken of one as possessing 'ideas of virtue which might have enlightened the moralist,' whom he at the same time represents as indulging himself at all times without the least regard to others, and as utterly without any sense of the decencies of civilised life, is surely most strange.

Johnson now describes Savage as practising for some years the art described in the Vicar of Wakefield—keeping up a subscription for his works, which yet never came out. Whatever he got in this way, even though it might be a benefaction of ten guineas from a liberal nobleman, he immediately spent in luxuries at a tavern, never stopping till it was done. His friends at one time commenced a plan of sending him a guinea every Monday; it was commonly spent before next morning. Wherever he went, his lively conversation gained him new friends and support; but his irregularities quickly disgusted them, so that his only chance lay in a rapid succession of new faces. Amidst all this essential meanness, there was a fiery pride about trifles. When a gentleman, meaning to be of service to him, asked him to call at a particular hour, he took it as an insult. When a few friends proposed to club for a new suit of clothes for him, and sent a tailor to take his measure, he flew into a violent rage, because, forsooth, he had not himself been intrusted with his re-equipment. But Samuel Johnson is hardly more reasonable, as will presently appear.

The last move of Savage's life was in consequence of an association of friends agreeing to allow him fifty pounds a-year, on condition that he would go and live upon it quietly in the country. This led him to Swansea in 1739, having left London with much reluctance. The arrangement, it seems, was not made very readily. 'Such,' says his biographer, 'was the generosity of mankind, that what had been done by a player without solicitation, could not now be effected by application and interest; and Savage had a great number to court and to obey for a pension less than that which Mrs Oldfield paid him without exacting any servilities.' In the name of wonder, how should this have passed for a century, in a popular book, without condemnation?

Is it not, in reality, victimising the worthy and kind-hearted, to exalt the reckless and selfish? Actually, the same page which contains the ungenerous remark, relates that Savage, having got fifteen guineas from these friends for his journey to Bristol, wrote on the fourteenth day, in a state of distress upon the road, for want of funds to carry him forward! And this perversity exists in a work of the greatest English writer of the eighteenth century! It is now known that Pope alone contributed twenty pounds of Savage's allowance. Such liberality from a successful to an unsuccessful literary man, was surely as praiseworthy as it is uncommon.

While secluded in the west of England—residing, after all, chiefly in Bristol, and there acting much as he had done in London—Savage quarrelled with many of those concerned in the pension, whom, it would appear, he only thought illiberal because they did not give him whatever he wanted. He would have returned to London, but never could save or keep enough for the journey. By degrees the unhappy wretch wore out the patience of all who had befriended him in the western capital, and then fell into actual want. Arrested at length for a debt of eight pounds, he spent the last months of his parasitical life in the most appropriate manner possible—a dependent on the bounty of his jailor. A short illness carried him off in Bristol jail in 1743, and he was buried, also appropriately, at the expense of his last patron.

So concludes this strange story. It is of course of no consequence, as a matter of literary history, how an obsolete poet of the worst age of English verse lived or died. But it is of great consequence how the tale of such a man's life is narrated. I venture to affirm that it has been narrated by Johnson in a manner which outrages all propriety, and has no excuse but the imperfect one, that the author, though himself a virtuous man, had been fascinated by the society of one unworthy of his regard. He tells enough to condemn Savage for ever—as that he 'appeared to think himself born to be supported by others, and dispensed from all necessity of providing for himself;' that he retained hatred longer than good-will; and that, when a friend had trusted him, 'he considered himself as discharged by the first quarrel from all ties of honour and gratitude.' Yet he can coolly add, within the next two pages, 'No wise man will presume to say, had I been in Savage's condition, I should have lived better than Savage.' There is, indeed, a sounding conclusion which has been often quoted, expressing a belief that the narrative will not be without its use, 'if those who, in confidence of superior capacities or attainments, disregard the common maxims of life, shall be reminded that nothing will supply the want of prudence; and that negligence and irregularity, long continued, will make knowledge useless, wit ridiculous, and genius contemptible.' But this is the one drop of vinegar amidst hosts of honied palliations. And after all, it goes not to the root of the matter. Want of prudence, and negligence, and irregularity, are not phrases which can express what brought Savage to contempt and misery. He was wholly an untrue and unworthy man. For what is it that constitutes goodness? Is it not mainly the ratio in which self-indulgence has been avoided, self-control been practised, and self-sacrifice encountered for kindly social objects? If so, see what title Richard Savage has to gentle consideration—a man who acted upon heedless impulse all his days, who hardly ever was indebted for a mouthful to his own honest industry, and who, while looking to others for everything, never denied himself a single pleasure which he could obtain. Even the excuses on the ground of his unfortunate origin, become absurd when we consider, on the other hand, that nature had given him abilities superior to the generality of mankind. They become still more ridiculous, as referring, not to a person of tender age, which is perhaps the common impression, but to one who advanced through the whole period of life's prime, and died at forty-six. The whole strain of Johnson's narrative is therefore,

in my humble opinion, false and dangerous. And there is no saying what fatal effects it may have had in affording self-justifications to subsequent men of talent disposed to lead idle and profligate, rather than sober and industrious lives. I am myself surprised to have this to say of a work of Samuel Johnson; but since I am led to think so, it would be cowardly to pronounce otherwise. Nor is it necessarily an assertion of personal superiority to one of our greatest men, thus to arraign and condemn his moral views. I believe that I write in the light of an age superior to that of Johnson, and only speak what hundreds of honest writers of our day would say, if they chanced to read with any care the *Life of Richard Savage*.
R. C.

THE HEROIC WIFE.

WHEN the revolutionary tribunals were established in 1793, Monsieur Duportail's name was one of the first which figured on the list of those suspected, who were to undergo trial, if the formula gone through on such occasions could be called such, and which so quickly sent its victims from the Conciergerie to the scaffold. M. Duportail had many titles to proscription, among which might be numbered his being steward of the royal farms, and an upright honest man. He had been married about three years to a lady he had brought from Martinique, by whom he had two children: mutual affection, and all the happiness that wealth can bestow, centered in his household when the Reign of Terror commenced.

Having fortunately received intimation of the threatened danger, he quitted his dwelling a few hours previous to the arrival of the revolutionary emissaries, and secreted himself in the house of an old domestic in the faubourgs. The same evening his wife joined him. In expectation of such an event, she had, a few days previously, collected what money and valuables were in her possession, regulated the affairs most pressing, and prepared everything which she deemed necessary for a sudden departure.

'We must instantly leave Paris,' said she; 'a carriage containing the children waits for us; and if we reach Bourdeaux, we can easily conceal ourselves in my father's house until an opportunity offers for embarking for Martinique.'

M. Duportail, unable to comprehend the extreme peril of his situation, endeavoured to dissuade her from her resolution; and it was only when she implored him for their children's sake to flee, that he at length consented to leave Paris the next day.

During the evening, the old servant having gone out to reconnoitre, returned with the startling intelligence that every conveyance was strictly searched at the barriers, and that many persons endeavouring to escape had been arrested. The good fortune of his wife in procuring two passports did not tranquillise him; and, aware of the surveillance which existed in every town through which they would have to pass, he determined on pursuing another course, which would at least save her the misery of being a witness of his arrest.

The next day he met the carriage at the appointed hour, and after some persuasion, prevailed on Madame Duportail to leave Paris accompanied only by the children, promising that he would immediately quit the city on foot, and disguised. Once safe outside the barriers, he hoped he might be able to procure horses, and rejoin her at Bourdeaux, or possibly on the road.

As was expected, on reaching the barrier the coach was stopped, and at either side appeared a sinister countenance, surmounted by the red cap. 'It is a woman!' exclaimed one. 'Who are you?' demanded the other.

Madame Duportail tendered her passport, and after a short scrutiny, the order was given to proceed. With a lightened heart she continued her route, each moment hoping to be overtaken by her husband: but vain were her expectations. Hour after hour passed in feverish anxiety, her only solace being the caresses of her chil-

dren. On arriving at Tours, there was no intelligence of him: the same disappointment awaited her at every town through which she passed. On reaching Bourdeaux, she immediately drove to her father's residence. 'My husband?' was all she could utter, throwing herself into her parent's arms.

'Your husband! Unhappy child, you are not then aware of his arrest?'

'Arrested! Where?—when?'

'At Paris on the 9th of October.'

It was the very day of her departure. Though stunned by the intelligence, she quickly recovered herself. 'Tell me all. He is arrested, but is he still living?'

'He is; but every day these monsters judge, condemn, and—'

'Leave the horses to the carriage!' exclaimed the young wife; 'or rather get fresh ones: I shall instantly return to Paris. I must save him—I shall save him!'

All remonstrance was unheeded, nor would she even allow her father to run any risk by accompanying her. The only delay to which she consented was while he went to procure a letter from an old acquaintance to a member of the Convention, who, besides having some influence himself, happened to be the confidant of Danton, the then minister of justice. Leaving the children with her father, she retraced her route, and, nearly exhausted, arrived in Paris eight days after M. Duportail's arrest. Without loss of time, she sought the deputy for whom the letter was directed; but on inquiry, was told by an old portress at the lodge that he was from home.

'I shall wait for him,' said Madame Duportail.

'As you please,' replied the old woman; 'but where will you stay?'

'I shall remain here,' replied madame, terrified by the insolent tone of the speaker.

'In the rain! You must be an aristocrat, then, for they are capable of anything. Our deputies have enough to do, I warrant; for they are beset from morning till night with petitions.' With a malicious glance she passed into the lodge.

Thus left to herself, the young wife could not avoid reflecting upon the situation in which she was placed; and though, under other circumstances, she would have shrunk at the idea of visiting a man unknown to her, she was too much absorbed with the thought of her husband's peril to heed it at that moment. A glance at her travel-stained dress, and a fear that her appearance in such plight would have an unfavourable effect on the mind of her protector, made her hesitate as to whether she should remain; but no time was allowed for consideration, for at that moment a gentleman, dressed in ball costume, carrying some papers in his hand, descended into the court.

'Here is the deputy, young lady. I find that I was mistaken in saying he had gone out,' exclaimed the portress, chuckling as she emerged from the lodge, yet half afraid that her falsehood might get her into trouble.

Madame Duportail presented the letter to the stranger, who, glancing at the writing, and then at his visitor, requested her, with an air of constraint, to come into the house. On opening the letter, and perusing it rapidly, 'I am going to the Convention,' said he, 'and have no time to lose: this letter tells me who you are, and is sufficient to make me do all in my power for your husband. Oblige me by coming up stairs.' He led the way into an elegantly-furnished apartment, the furniture of which bore evident traces of the Revolution. The pictures were surmounted by armorial bearings, some of the subjects being devotional, while others represented battle scenes, in which members of the royal family were conspicuous: the room evinced all the luxury of a noble mansion of the old regime.

Having handed his visitor a chair, the deputy seated himself before a table covered with papers and pamphlets.

'Madame, I fear that Citizen Danton is at present in the country, but I shall give you a letter which must be delivered to him by yourself on his return.'

'Will his stay be long, monsieur?'

'A few days.'

'But, monsieur——' 'The scaffold will not await his return,' she would have added, but her voice failed, and she burst into tears.

'He may perhaps be here to-morrow,' said the deputy, as he commenced writing. Her eyes followed the pen in its movements, and with difficulty she restrained herself from sobbing aloud. 'There,' added the deputy, as he folded the letter, 'I am confident my friend will be satisfied that I have done all that lay in my power, as he has demanded. I am happy in having rendered you this little service,' continued he, as he rose and politely presented the letter.

Madame Duportail had also risen. 'Do you think, monsieur, that Citizen Danton will take pity on me?' she asked in an almost inarticulate voice.

The deputy regarded her for a moment silently, and with a scarcely perceptible smile replied, 'I have no doubt of it.' He made a few steps towards the door, but returning, added, 'Be sure to deliver the letter yourself.'

They descended the stairs, and the deputy, making a profound salute, rapidly traversed the courtyard. Madame Duportail followed more slowly. It was only then that she was struck by the peculiarity of the look which accompanied the injunction to deliver the letter in person, and she felt some misgivings as the idea arose in her mind that there was a mystery linked with it which she could not fathom. While walking along the street, her attention was excited by a stentorian voice exclaiming, 'A list of the execrable conspirators who have been condemned by national justice to suffer to-morrow morning.' She shuddered as she tendered a piece of money to the man, who, handing her one of the papers, continued his route, uttering his funeral cry. With a palpitating heart she glanced over the list, which contained the names, ages, and rank of the victims whose doom had been pronounced; but her husband was not among the number. 'He still lives,' was the wife's silent ejaculation. But who could speak for the morrow? The remainder of the day was passed in gleanings of information respecting the prisoners: her husband, she learned, was incarcerated in the Oratorio.

The next morning she went to Danton's house. The citizen minister still slept. On her return some hours after, she was told that he had left town. 'Where has he gone?'

'To Auteuil,' was the reply of the domestic, in a tone of impertinent familiarity.

This suspense was dreadful; but her hopes again rose when, on consulting the public lists, her husband's name did not appear. The following day, changing her dress so as not to be recognised by the valets, she inquired for Danton. The minister was in his office, but could not be disturbed. Entering a cabaret at the opposite side of the street, from whence the house was observable, she called for some wine. The woman of the shop, interested by her youth and beauty, and rightly guessing that some other motive than that of drinking wine induced her to remain so long, strove by her attention to lessen the young wife's grief. The evening fell, and thanking the woman for her kindness, Madame Duportail, with the energy of despair, boldly entered the minister's hotel. On the domestics endeavouring to prevent her going beyond the courtyard, she showed the letter, mentioning its being from Citizen R——, and the necessity of its immediate delivery. The deputy's name acted like a talisman, and she ascended the grand staircase. Servants were hurrying to and fro, and in the confusion she reached the door of one of the upper apartments, from whence the sound of boisterous mirth proceeded. She was here accosted by a domestic, who inquired her business. Without making

a reply, she endeavoured to pass him, in which she partly succeeded, but recoiled with terror at finding herself in a brilliantly-lighted apartment, where a number of men were seated around a supper-table. The noise occasioned by her entry attracted the attention of a man with square high shoulders, his hair in disorder, and wearing a ribbon at the breast of his coat, who angrily demanded the cause.

'Citizen minister, it is a woman.'

'Ah, she wishes to see me, I suppose? We must attend to the ladies,' added he, coming forward and endeavouring to assume an air of politeness.

Madame Duportail lowered her eyes as she presented the letter, which Danton opened and perused.

'Madame Duportail, my colleague has already spoken of you: we must look after this affair.'

'You know, monsieur, how pressing it is.'

'Yes, yes; I know all about it,' replied Danton, as he rudely gazed at her.

'Monsieur, one line from your pen—'

'Assuredly: we shall see: but I cannot allow so pretty a woman to depart so soon. I have a few friends with me, but there need be no ceremony. Favour us with your company. Come!'

A dizziness seized her, as she entered the room, on perceiving that the eyes of all the guests were directed towards her. 'I present you, madame, to the friends of whom I have spoken; they will be delighted, I am sure, at seeing you amongst them,' said Danton as he handed a chair, which she, however, removed some distance from the table.

'Will you not, then, honour us by taking supper?'

Madame refused by a gesture. For a time her presence seemed to throw a constraint over some, while others continued their conversation, glancing at her with looks of impertinent curiosity. Danton alone addressed her, endeavouring from time to time to persuade her to join them at table. During supper he drank deeply, and now and then joined the conversation which was passing around him, his stentorian voice, when he spoke, drowning all others. A discussion at length arose, which was put an end to by Danton's health being proposed and drunk.

'To the Republic!' shouted a voice at the lower end of the table. The glasses were immediately filled, while the eyes of all were turned towards Madame Duportail.

'This time, I am sure, you will not refuse to join in the pledge with these brave gentlemen: the wine is of the mildest description.'

'I suspect,' said one of the guests, 'that it is not the wine she fears, but the pledge which the toast carries.'

'I'll wager that she does not voluntarily drink to the nation,' remarked another.

'Confound this hesitation!' exclaimed Danton impatiently; 'prove that you are a good patriot, and worthy to figure at table with the principal members of the Convention.'

Madame Duportail's agitation was excessive; but a sense of danger recalled her presence of mind, and taking the proffered glass from Danton, she replied, 'I shall drink to the nation with pleasure.' On her pledging the toast, the plaudits of all were vociferous.

'We want nothing but music to complete our enjoyment,' said a young man, addressing Danton.

'True, very true; I love music passionately, though I do not understand three notes. One would imagine that, with such a voice, I should sing well; but in my younger days

"The woods with echoes rang
From the tone in which I sang."

While all laughed at the quotation, he leant gallantly towards Madame Duportail. 'With such a charming countenance, you must have a divine voice. Do you sing?' A reluctant affirmative escaped her lips. 'You will sing, then?' added he; 'but we must procure a harp.'

Madame Duportail, pale and indignant, and with the sensitive feelings of a woman, though she felt that the life of her husband might perhaps depend on her acquiescence, endeavoured, when the harp was brought, to excuse herself; but those by whom she was surrounded seemed to take a fiendish pleasure in the misery they were inflicting.

'Will you refuse me, then?' said Danton half aloud. 'Take care, madame; recollect it is the first favour I have asked.'

Having sat down before the harp, with a trembling hand she played a prelude, and sang with tolerable composure one of the favourite songs of that period, which Danton applauded with ecstasy, and obliged her to repeat. The effects of the wine became every moment more perceptible on all. Several coarse jests were hazarded; and at length became of such a nature, that she arose, under pretext of requiring air. 'Very well,' said Danton in a brusque manner, and without leaving his chair, 'you can wait for me in the neighbouring apartment.'

She was conducted by a valet along a corridor into a room, the walls of which were hung with costly pictures. In the centre, strewn with papers and writing materials, was a table from which in all likelihood had emanated those fearful warrants of death which had made so many hearths desolate. Such was the involuntary thought of Madame Duportail; and as the idea smote on her heart that her husband's condemnation might at that moment be lying before her, she was seized with a vague feeling of terror, and sank powerless on a chair. The sound of boisterous mirth caused her frequently to start, and her apprehensions were further increased by perceiving that the candle was nearly exhausted. She had been nearly two hours alone, when a domestic entered, bearing a lighted candle in each hand. 'When shall I be able to see the minister?' she asked in an agitated voice.

'He is coming,' replied the man, as he deposited the candles on the table and retired. At the same moment a door at the opposite side of the apartment opened with a shock, and before the young woman uttered the cry which rose involuntarily to her lips, she recognised Danton, who, staggering into the room, threw himself on a chair. He was without his cravat, and the frills of his shirt were disordered, and stained with wine. On perceiving his visitor, his inflamed countenance assumed a maudlin expression as he exclaimed, 'Ah, is it you, citoyenne?'

The injunction of the deputy, when giving the letter, flashed vividly across her memory.

'I shall surely die of apoplexy!' muttered the minister in a maudlin voice; 'that is, if they give me time. These suppers are very pleasant, but—the morning!'

Madame Duportail's terror changed to agony at the thought that he might be too inebriated to write, and hastily approaching him, she exclaimed, 'Citizen minister, you surely have not forgotten the promise you gave me?'

'Ha! What do you say?'

'The letter you are to write—the grace you would accord me at the recommendation of Citizen R—the life—the life of my husband!'

'Well, it is but necessary to erase his name from the list—that is to say, to remove it from the bundle.'

'What bundle?' exclaimed the wife with feverish anxiety: 'Where is it?'

'Give me air. I am stifled!'

Not daring to go within reach of the drunken monster, she ran and opened the window.

'That Robespierre is a scoundrel—he never drinks unless it be blood. Baptiste, undress me!'

'Monsieur—monsieur!' interrupted the young woman, 'where is this bundle—this list? Give it me.'

Danton turned with impatience to the other side, and growled, 'Call Fauquier; he knows where it is: or take it yourself,' added he, pointing to an escritoir, the nests of which were filled with papers.

Following his directions, she quickly stood on a chair, and commenced her researches. 'Carton A?' asked she in a voice trembling with anxiety, taking down a lettered bundle.

'I ask pardon, my dear, for my gaiety. I feel obliged to R—for having sent you. Do let me hear another chanson; you sing so divinely.'

For a moment she remained silent, but perceiving that he was again falling into a lethargy, she once more broke silence—'Carton B?'

'What's his name?'

'Duportail.'

'Duportail!—Carton A!—Carton B! Seek then in D. How stupid you are, my dear! You amuse me with your Carton A!' added he, giving way to a burst of laughter as he sunk back in his chair.

Without loss of time she took the bundle of warrants marked D, and opening the string, hastily perused the name written on the back of each. Her husband's was the third; the warrant bore the minister's signature, and his execution was to have taken place the following morning. Securing the paper with an inward thanksgiving, she moved forward to thank Danton; but seeing that his eyes were closed, noiselessly glided towards the door, and disappeared.

The next morning, with the warrant in her possession, she found little difficulty in getting Duportail's name erased from the jailer's book, and she and her husband were soon on their route to Bourdeaux, where, reunited to their family, they sailed for Martinique. At the Restoration they returned to France; and the Heroic Wife is, we believe, still alive.

EDUCATION OF IDIOTS AT THE BICÊTRE.

SECOND ARTICLE.

THE means of educating the juvenile idiots at the Bicêtre, as formerly mentioned,* consists of a variety of exercises likely to rouse the dormant capacities of the pupils. Some of the exercises, not already described, consisted of marching in various figures, as arranged by small ornamented flags. These evolutions seemed to impart much pleasure.

The next series of exercises, though less attractive as a spectacle, were probably equally useful, if not more so, as a means of exciting attention and compliance with the particular directions of the instructor. At his request each pupil held up first the right hand, then the left, then both hands. Subsequently, the right hand was ordered to be pointed to the right side, and then to the left; the same also with the left hand: the corresponding leg and arm were now required to be advanced, then those of the opposite side; and lastly, they were desired to kneel and rise again at the word of command. They then embraced each other, and remained standing two and two in an easy and graceful posture, producing an appearance of mutual good-will and friendship. Indeed it is more than probable that the mere assumption of such attitudes may become the means of exciting some small share of fellow-feeling and attachment between the different members of this singular community. These various positions and motions of the limbs were simultaneously performed by the whole of the pupils at the instant the order issued from their preceptor.

A large mat was now unrolled, and placed in the centre of the room, when various gymnastic exercises were entered upon by several couples. At this time it was especially gratifying to witness the amount of observation and attention excited in the bystanders, as was manifested by their hearty laughter, whenever a failure or accident happened. As only a few could be engaged in these gymnastics, the rest were left to their own discretion, and in a little while they became

distributed in various parts of the room: the majority, however, remained watching those at play, others loitered near the musicians, touching, with simple curiosity, the various instruments which had performed an important part in leading and guiding their feeble and wandering faculties. Before entering on the next series of instructions, it was desirable that the whole should assume an orderly demeanour, and they were accordingly required to arrange themselves, and prepare to march round the room. Having done this once or twice, they were ordered to halt opposite the seats placed ready for them; then desired to be seated; each taking his place at once, and all seeming ready to attend to their next lesson.

Several pieces of wood, cut in the shape of different geometrical figures, were now brought into the room. These were placed in the hands of different pupils, who named with much readiness the various forms—as round, square, oval, oblong, &c. In order to exercise the sense of touch without the aid of that of sight, a bandage was placed over the eyes of one or two, and the different pieces were put into their hands, when each of them slowly passed his fingers along the edges, and when satisfied with the examination, named the form of the respective portions. In doing this, no error was committed. The utterance was of course imperfect; but although the words were pronounced in what to the visitors was a foreign tongue, no difficulty was felt by the other pupils in distinguishing what was said.

A large black board was now brought forward and placed on a rest. One or two of the more proficient were desired by M. Vallée to draw upon it first a horizontal, then a perpendicular line, and afterwards to describe a circle, square, and hexagon. Words also were well and readily written in a good round legible hand. The same feebleness and uncertainty of grasp, arising from an imperfect power over the fingers, was again observable, but the writing was fairly executed, and the figures correctly described. They were slowly done, it is true, but still they were well done. Remarking that the compasses used in describing the mathematical diagrams had a movable hinge, I was surprised to observe, that although there was so much apparent unsteadiness of muscle, yet such a degree of adjusting power over the motion of the fingers had been acquired, that the various points necessary to form the different figures were marked on the board without causing the least variation in the limbs of the instrument.

One of the more elderly of the pupils, but one who in England would be called a hopeless idiot, was now brought forward. His whole appearance and expression previous to the moment when he was desired to approach the table, were indicative of an utterly hopeless, mindless object. Being raised on a seat, a set of dominoes were placed before him, the sight of which caused evident signs of pleasure, and he proceeded to make preparations to enter on the game. Although having a very imperfect control over his hands, he selected from the set the required number, arranged them, and played a game with his instructor. This was done deliberately, but without any faltering or inaccuracy; and during the progress of the game he showed signs of satisfaction or discomfiture, according to his success or otherwise. The efforts to overcome the congenital imperfections in this poor fellow were strikingly successful; and it is not improbable that, had they been undertaken at an earlier period of his life, a capacity of standing in the erect position and of walking might possibly have been obtained. In addition to other educational exercises, patient and continued efforts had been made to create in him a power over the various muscles constituting the organ of voice. Although only capable of slow, imperfect, and irregular utterance, he named the various letters of a word placed before him, first dividing them into syllables, and then pronouncing the word. I subsequently saw him, at a later part of the day, seated in the workroom amongst his fellows, usefully employed in making very excellent

* Journal, No. 156.

list slippers. As I approached his bench, he evidently showed signs of recognition, and seemed pleased at the notice taken of his work. He handed me several pairs of slippers which he had finished, then showed the one he was engaged with, entered on his work again, and looking up from time to time as he proceeded with it, evinced the pleasure he felt in his employment, and the gratification he experienced in finding that it interested and met the approval of others.

The attention of the pupils assembled round a table was now directed to a large sheet of paper, on which was painted every variety of colour. These tints were disposed in a confused manner, so as to prevent the liability which otherwise might arise of mere rote work, or the utterance, from habit, of consecutive words without comprehending their meaning. In this, as in all the other educational arrangements, the attention of the pupil was first directed to the simple and the more striking parts. On this occasion, consequently, the primitive colours were first named, and last the more compound, between which the shades of distinction are less marked. The perfection to which the sense of sight, the power of discriminating nice differences of colour, and of remembering and uttering their respective names was brought, in some of the pupils, was truly surprising.

Several examinations in the names of objects were now undertaken, such as the various articles of dress and pieces of furniture. Following these, the number of days in the week and months in the year were given; then the names of each day and month, as well as the seasons of the year. The replies to these questions relating to names of objects and periods of time were quickly and readily given; and had I not already witnessed so many evidences of the excellent system of training of which these poor fellows have had the advantage, I should have been inclined to doubt whether a proper comprehension of their meanings was attached to the several words they uttered. I had, however, sufficient reason to believe that, to a limited extent at least, they understood what was meant when they gave answers to the questions proposed.

Instructions as to the relation of objects to each other were now entered on. A small box being placed on the table, one of the youths, at the request of the master, first named the different parts of it—top, side, bottom, &c.; and subsequently the relation of objects as respects position in regard to it. For instance, when anything was placed upon it, the word 'sur' was given, and so also 'sans,' 'dedans,' &c. according as the little object was put in these various situations in relation to the box. Here was an evident advance on the other exercises, showing an increased capacity of comprehension. The simple, natural, and easy way in which such knowledge was communicated, was at once strikingly applicable, and was also admirably calculated to excite the mental faculties, by extending the very limited range of comprehension bestowed on these unfortunates.

A model clock was now brought out. It was constructed so, that the relative position of the fingers could be altered at pleasure. Under the direction of the tutor, the different hours of the day were indicated, as well as the fractional parts of an hour. The face of the clock, thus varied, was presented to several pupils, when the time was correctly and exactly stated by each. During the progress of these examinations, several of the boys advanced from the main body who had remained seated around the room. The few who thus left their fellows gathered round the table, and seemed to take interest as well as pleasure in the proficiency manifested by their brethren. Every now and then they approached the place where I was seated, and looked up inquiringly, as if desirous to know what I thought of their proceedings. That they were capable of entertaining such feelings, was made evident by several simple occurrences excited by passing events during my stay among them. Some amount of interest in each other was also shown, and the extent to which care was exercised by the improved

over the more ignorant and wayward was undoubted. I was particularly struck on one occasion by the manner in which an elder boy led back to the seat his younger and more restless companion, in whom the system of education had not yet produced that power of self-control which most of the boys had attained. The youth who rendered this service to his neighbour had attracted my notice when I first entered the room. He presented every appearance of an idiot of the most hopeless class to such a degree, that I singled him out as one worthy of particular observation, with a view of ascertaining how far the functions of an intelligent being could be imparted to one apparently so forlorn. I may here mention, that at a subsequent stage of the proceedings this same boy advanced to the table, and appeared to take an interest in what was going forward. Observing a small note-book I held in my hand, he took it up, opened it, and after turning over a few leaves, returned it to me, as if his curiosity was satisfied.

The mode of communicating ideas of numbers, and of their corresponding signs (figures), was as simple and successful as the methods adopted of imparting a knowledge of the properties and positions of objects. The result of their tasks in this department showed how applicable such a system was to their feeble understandings. Several circular pieces of ivory were first placed on the table, and then divided into two unequal portions, so as to communicate the idea of quantity by requiring the pupils to say which was the larger and which the smaller portion. A certain number were then placed together, say three or four, and the question was asked—How many are there? The answer being given, the attention of the pupil was directed immediately to a board on which were painted the figures, and opposite to each figure a corresponding number of circular spots of the same size as the pieces of ivory. He here saw the figure placed opposite the number of pieces before him, and the idea of number was produced: thus several sums in addition and subtraction were now undertaken, and in the execution of these, the board was sometimes used as a means of fixing attention and assisting the memory. The more proficient, however, readily replied to the various questions put to them without calling into operation the aid of the sense of sight. They answered correctly, and without hesitation, such questions as—How many do 6 and 8 make? Take 3 from 9, and how many remain?

I was particularly struck with the burst of feeling produced in one of the junior pupils when foiled in the performance of his task. He was seated at the table on which were laid the pieces of ivory. These were first divided into two unequal portions, and he was requested to point out the greater and the smaller set. Three of the circles were then given to him, and he was desired to take from the others an equal number. Having performed these tasks, an even number were placed before him, with the request that he would divide them into two equal portions: this he proceeded to do by taking out very slowly and carefully the half of the number. An uneven number, consisting of nine pieces, were now given to him with a like request: this he tried to comply with as before, by separating four on each side; he then hesitated, re-examined his numbers, seemed perplexed, and at length finding, after a little pause, that he could not perform what was required of him, he burst into tears, and showed, by the difficulty which was experienced in assuaging his grief, how deeply he was capable of feeling both disappointment and vexation at his supposed inefficiency. This little incident told plainly of an important influence brought into operation. It explained how much could be done by acting on the *amour propre*. The grief at discomfiture, as well as the pleasure excited by success, showed that this power was used as a key to unlock dormant faculties, and to open the portals of intelligence.

My attention was now directed to a youth in whom the greatest difficulty had been, and was still expe-

rienced, in preventing a wandering and irregular action of the mind. Ideas of numbers, and a capability of counting, could be imparted to him; but unless his attention could be fixed by a simultaneous exercise of some of his senses, or by muscular movements, it was found difficult to induce him to advance from one number to another. Thus, when he was desired to count 1, 2, 3, &c. his eyes were bandaged, a triangle was held before him, and struck at regular intervals of time, so as to lead him on from one number to the next at each beat of the triangle. A ladder being placed against the wall, he was desired to mount it, and count at the same time: this he did regularly and slowly, naming an advancing number at each step he took. Other gymnastic exercises, I was told, had been employed with a view of fixing attention, and producing a more regular succession of ideas. The ingenuity and aptness of the means used in this particular case speak eloquently of the spirit in which the work of regenerating these all but mindless fellow-creatures is undertaken.

The series of exercises in the schoolroom was terminated by the construction of words, and the addition of figures, by means of letters and figures cut out and fixed on small portions of wood. A word or a number being given by the master, the pupil proceeded to select the letters or figures, and place them in the order indicative of the word or number. This lesson was executed with the same accuracy which had characterised the various proceedings which it was my good fortune to witness in this schoolroom at Bicêtre, and which served to excite within me a deep feeling of thankfulness for the opportunity I had enjoyed of becoming practically acquainted with the system in operation. As each successive and advancing demonstration was made before me of the extent to which the senses and faculties of these idiots had been educated, I could not avoid feeling a corresponding increase of the delight I at the first moment experienced in witnessing a sight so intensely interesting and important.

THE AGE OF FUN.

EVERY age claims to have a character of its own. This is the age of railways and jocularities—a curious combination, which no one could have predicated in that very sober state of affairs twenty years ago. England is decidedly getting into a hurry. We have no time now to be grave. We must go ahead as fast as possible, and by all means keep ourselves laughing by the way. How did all this come about; is the fashion imported or indigenous? Are other nations as busy in joke-making as we are? It is pleasing to know that they are, and that with a liberal hand they occasionally send us some of their own good things to laugh at. The caricature engravings at present stamped by the national taste to pass as laughable, afford an instance. We used to rally the French upon their unconsciousness of this kind of humour, and with great justice; for the utmost they could do to provoke cachinnation was to stick an enormously disproportioned head, with distorted features, upon a Lilliputian body. The French, however, persevered, and the consequence has been, that our own artists have now adopted the idea. I do not know a single illustrated book of the comic class of the present year in which it is not predominant. The joke consists in the preternatural ugliness of the face, and the impossible contortions of the limbs. We are expected to laugh at what in nature we should turn away from with pity, loathing, or horror; and since it is a joke, we do laugh at it with all our might. Some artists of course pay attention to the legitimate drollery of expression, attitude, and situation; but in general they are satisfied with attempting to surpass each other in hideousness. The expression 'out of drawing' was formerly used in

criticism, but as regards this department of the fine arts, it is now entirely obsolete. Indeed the less a caricaturist knows about anatomy and physiognomy, the greater chance he has of arriving at distinction.

This, I need hardly say, is a mere peculiarity of the day, which will probably be entirely exploded before another New Year; but fashion is perpetually working little miracles of the kind. Sometimes it affixes its stamp to a particular expression, which straightway passes current as a jest, without possessing in itself the faintest meaning of one kind or other. There is one occurs to me just now which, in London, I never knew to fail, in or out of the theatre. It is used as a reply to a request, or as a remark on some expressed wish or longing, and consists of the simple words, 'I wish you may get it!' This talismanic sentence, whether pronounced in the street, in a private company, or on the stage, invariably creates a laugh, although the farce or song of which it may have been the catch-word—if it really had any origin of the kind at all—exists no longer even in tradition. I select this one, however, merely because it has continued longer unimpaired in force than any other I remember. The Londoners are always catching up some saying from the stage, and repeating it long after its parentage is forgotten. It signifies nothing that the associations which conferred upon it its jocular character are lost, it continues to pass as a joke on its own account. The instinct of imitation takes place of the perception of humour; and it circulates like the monosyllable 'ha!' in the philosophical game of 'Forcing a Laugh.' The reader knows that this is played by sending the supposititious fun round, gauntlet fashion, among the company; the leader beginning 'ha!' his neighbour instantaneously echoing 'ha!' the next passing it to the next, and so on—'ha! ha! ha! ha!'—till the result is a continuous roar.

The Americans, we believe, are no great jokers with the pencil; but there is a length and breadth about their literary perpetrations altogether peculiar. The physical aspect of their country seems to be reproduced in their drolleries, which have a character of vastness, wildness, and emptiness that baffles the imagination. A little book I have my eyes upon just now—and which I mean to lay hands upon presently—attempts to civilise these gambols of the Infant Hercules into the walking pace of a ladies' school. It will give the jokes of the new world, forsooth, a European meaning! And why? Because there is no wit in them as they are popularly reported. Why, who cares about wit in a joke? Whether it is wit, or the want of it, I should be glad to know, that makes people laugh? Commend me to the big American, who was so tall, that he was obliged to go up a ladder every morning to shave himself! There is no wit in that, I hope. It is a piece of sublime absurdity, as unadulterated as the Falls of Niagara. It sets the fancy at nought as completely as when you attempt to grasp the idea of Lake Superior. Try that little book, and you will find that, by no mental effort, can you picture to yourself anything more than a millpond. Compare this joke with the hail of the young chimney-sweep in Fleet Street to the gigantic barrister, 'I say, mister, putting his black paws to his mouth, trumpet-fashion, while he turned his face to the zenith—'I say, mister, ain't it werry cold up there?' This is good—but we can understand it. It is European.

'A farmer had a scythe so exceedingly sharp, that, having hung it upon the bough of a tree on a moonlight night, a poor man passing by had his leg cut off by its shadow.' This is given as a specimen of American wit; but I say it is as genuine and immeasurable a Jonathanism, as the feat of the man who chased a flash of greased lightning three times round a field; or the rapidity of the gentleman's gig, in which the friend, seeing the milestones so crowded, inquired what churchyard they were passing through? The real wit, when it exists at all, belongs entirely to another world. The Americans were born too late to have any of their

own; it was all used up by their European ancestors. Take, for instance, a specimen quoted in the little book:—'A man in Kentucky imitated the crowing of a cock so perfectly, and sometimes indulged in the freak so early in the morning, that upon one occasion the sun in mistake rose two hours before its proper time.' This is only an imitation of a mistake that was made long ago by the identical sun—not to talk of any higher antiquity—and is much better related:—

'Take, oh take those lips away,
That so sweetly were forewarn;
And those eyes—the break of day—
Lights that do mislead the morn!
But my kisses bring again—
Seals of love, but sealed in vain!'

The little book I have alluded to is called 'Irish Diamonds,' by John Smith, late lecturer on education and geographical science.* In this, of itself, there is a rich antithesis between the mock and the true, the grave and the jocular; and the promise of fun thus conveyed in the title-page is fulfilled in the book. But the title is better (by way of a joke) than antithetical; for it is morally impossible to think of Mr John Smith as a lecturer, or anything else in particular. There is a puzzling uncertainty, a poetical indistinctness, a shadowy mystery about the name, which beats Jonathan hollow. The nearest approach we can make to the identity of Mr John Smith, is to picture him as one of the forty gentlemen who, in the pit of Drury Lane theatre, were seen clapping on their hats, and making for the doors from all quarters, when a voice was heard calling out at one of the entrances, 'Mr Smith is wanted!'

The book is a cluster of brilliants, chiefly Irish, of old material, but shaped and polished by Mr Smith, and set in metal of his own, sometimes genuine, and rarely with much alloy. I do not see, however, that his theory of Irish wit and blunders throws any new light upon the subject, or that the theory is at all assisted by the diagrams intended for its illustration. In these diagrams the English arrow (of thought) is seen flying horizontally to the mark at the other side of the room; the Scottish arrow turning cautiously round in the middle, as if to ascertain that it is in the right path, and then arriving at the same object; and the Irish arrow darting away diagonally, either to the upper or lower corner, and striking out a flash of wit in one, or an amusing blunder in another. This proceeding of the Irish arrow, we are told, is not caused solely by hurry or precipitation, but likewise by an antipodean habit of the people—a love of opposite extremes and contrasts, a delight in applying the contrary end of the telescope of thought. But this habit, in its application to blunders, is not national, but universal, and is *always* the consequence of precipitation, or the acting or speaking without thought. Speaking for myself, if I have two things in my hand, and am called on suddenly to drop one of them, I *invariably* feel an inclination to drop the wrong one, and this is only corrected by the counter-habit of thinking what I am about. The predisposition to error here is caused by the thought instinctively flying to the more valuable or needful object at the same moment when the necessity presents itself for dropping something. A gentleman stands by the fire, with an egg in one hand and his watch in the other, observing a saucepan. Suddenly the saucepan begins to boil, and, obeying the instinct of his anti-mathematical nature, he pops his watch into it instead of the egg. There is nothing out of the way in this, supposing him to be a person who does not attach reason to the boiling of eggs any more than to other things; but when he stands with the egg in his hand, watching how his watch boils, the incident is taken out of the category of practical blunders, and becomes a specimen of absence of mind. All, however, is set right again by the conclusion. He holds the egg in his hand for *three minutes*. This is the

point of the jest, and we may laugh with a good conscience. We all blunder occasionally from want of thought, and the Irishman more frequently than any of us, owing merely to the quickness of his temperament and his aversion to mental discipline. The same quickness may lead him more frequently than other people to a witticism as well as to a bull; and in my opinion, his reaching the one rather than the other is, in nine cases out of ten, the result of mere accident.

The following specimen of the antithesis in which the Irish are supposed to delight is not new, but it is well worth repeating:—

An Englishman is never happy but when he is miserable;
A Scotchman is never at home but when he is abroad;
An Irishman is never at peace but when he is fighting.

I shall now quote, in the words of Mr Smith, an instance of precipitation of thought, which is the *æ plus ultra* of an Irish bull. 'A jovial, good-humoured, and industrious commercial traveller, a native of the Green Isle, though he felt much fatigued by a hard day's duty in a country town, resolved, whilst enjoying his evening glass at the fireside of the inn, that, deep winter as it was, he would make an early stage in the morning by a coach passing through the place, and which would reach his next scene of business by breakfast-time. He named this project in presence of several of his brethren of the road, and gave orders to "boots" to call him just in time for the coach, and no sooner, as he would make his toilet in the next town, where he should arrive by daylight. Having paid his bill, and feeling that all was comfortably settled, he sat till rather a late hour in the warm room, where the fumes of a cigar or two from his neighbours probably contributed to his dropping fast asleep. Some of the party, taking advantage of his condition, carefully blacked his face. By and by he became wakeful enough, though still very drowsy, to find his way to bed. In the morning "boots" awoke him exactly in time; and hastily huddling on his clothes, he was soon in the coach, where, darkness being still around, he was soon again asleep. In a couple of hours the coach pulled up at the inn, and he was shown, in the gray light, and with candles still visible here and there, into the gloomy breakfast-room, when, after gaping and stretching, he took up a candle, that he might look at himself in the glass, and turn up the hair from his forehead, when, utterly astounded at the black and unknown visage he there beheld, he shouted out lustily, and in a tone of sudden alarm, "Why, by the powers, if boots hasn't wakened the wrong man!"'

Comment upon this would only spoil it. The absurdity is carried to a pitch of the sublime which it is perhaps impossible to surpass. Horace Walpole's favourite bull, in which a man is represented as bearing ill-will against his nurse for having changed him when a child, may be said to confound personal identity in the same way. But it wants the suddenness which is the charm and the naturalness of the other. We think of the Orford blunder, losing ourselves in its unfathomable depths; but the other gives us no time to think, but startles us at once into a shout of laughter. It is the suddenness, too, which makes it Irish; for in point of fact a similar idea occurs in Don Quixote. An Irishman would be the last person in the world to talk nonsense, if he gave himself time to think: his blunders are always, and his 'diamonds' sometimes, the result of mere haste.

The English have usually been represented as bad makers of bulls, but no one can now say they don't execute a vast variety of very funny sayings. Their fun, in fact, has become a staple article of literature; and on the whole—and here is the good feature in its character—it is not a wicked, or a personal, or a bad-minded fun: it has its faults, but, generally speaking, it is enlisted in the cause of what is estimable. With this tribute to its merits, however, I would take leave to hint that things are getting on at too great a rate. The fun is getting so 'fast and furious,' that, like a steam-

* Irish Diamonds; or a Theory of Irish Wit and Blunders: combined with other kindred subjects. By John Smith, one of the editors of the 'Liverpool Mercury,' &c. Chapman and Hall.

engine which has lost its governor, it almost threatens to knock the whole apparatus of literature in pieces. I hope our good friends the funny fellows will kindly look to this. The world should have a little repose in the midst of its jocular evolutions: if it has not, I fear it will be found one morning soon to have actually split its sides with laughing.

MUSEUM AT COPENHAGEN.

[Mr Kohl, whose tour in Great Britain we noticed some time ago, has recently published his *Travels in Denmark*. His volumes will probably not be deemed of sufficient interest to the English public to cause them to be translated; nevertheless there is a good deal of information scattered through them. The following is an abridgment of one of the chapters.]

THE museum of Northern Antiquities at Copenhagen is one of the most remarkable museums in the world; and indeed it may be called unique in its class, if we consider the richness of its stores. Since it was founded in 1807, there have been formed several similar museums in Mecklenburg, Stockholm, Christiana, and by private persons in Scandinavia; but all these collections are poor in comparison with the one at Copenhagen. It reflects great credit on the Danes, that they should have taken the lead of the European nations in the investigation of local antiquities. It is perhaps to be attributed, however, to the circumstance of their being a nation much devoted to historical and legendary lore, as well as to the fact, that primitive times are much nearer to them than to any other civilised people. It is manifest, from the utensils of stone discovered here and there in Italy, Greece, Spain, &c. that in these lands also dwelt barbarians, unacquainted with the use of metals, who made stone instruments serve their purposes. But doubtless metals were introduced much earlier in the south, and therefore fewer stone implements would be committed to the ditches and morasses for preservation; and when found, such rude things would be little esteemed, and therefore destroyed.

There have existed in Denmark for more than a hundred years societies for the study of Danish history. The society for the cultivation of northern history and languages was founded in 1744. From a member of this society, the librarian, Nyerup, a man well known for his historical and literary writings, first proceeded the idea of a national museum, and he was soon joined by Bishop Mûnter. By the exertions of these two men, the attention of the public was directed to the old barrows (tumuli) and their neglected contents. People began to collect, to dig, and to preserve. The students of the establishment founded by Christian IV. were aroused to a sense of the value of antiquities by Nyerup; and when they were afterwards scattered over the country, they took along with them a love of such things, and were useful in getting together a great number of objects. At length a royal commission issued, with the design of preserving all northern antiquities in Denmark, and a correspondence was entered into with learned men, clergymen, schoolmasters, &c. inviting them to forward intelligence of any ancient remains that had been found, and, if possible, the objects themselves. Formal instructions were drawn up, printed, and circulated, to carry out the purposes of the commission, and the government lent its aid, by adopting other judicious measures, particularly by notifying that the discoverer of any antiquities in gold and silver would be paid the value of the metal, notwithstanding they belonged by law to the king. Other indefatigable antiquarians trod in the footsteps of Nyerup, and in 1825 the Royal Society for Ancient Writings was incorporated, which took the museum under its protection. The activity of this society has been most laudable. Its influence has not only been felt in all Scandinavia, but all through the northern extremity of the earth—Russia, Great Britain, Northern Germany, the Netherlands, and North America. Members of it, learned and influential men, reside in all these countries, and it has a consider-

able income. In the course of a twenty years' existence, it has not only increased the museum to a great extent, superintended its removal to the castle of Christiansburg (part of which was lent to them by the king), and put the whole into admirable order, but it has also issued a series of very rare and important works relating to the history of the north. These valuable works comprise about sixty volumes, which, without the labours of the society, would in all probability have never been laid before the world, the cost of publication being greater than the profits of the sale. Amongst them are found—1. The Historical Saga of Denmark, Sweden, and Norway, in the Icelandic, Latin, and Danish tongues. 2. The Mytho-historical Saga of the North before the Ninth Century, in Icelandic and Danish. 3. The Heroic Poem concerning the Deeds and Death of King Ragnar Lodbrog, in Danish, Latin, and French. 4. The Historical Saga of the Inhabitants of the Faroe Islands, in Icelandic, Danish, Faroish, and German. 5. The Historical Saga of Iceland. Two of the latest and most remarkable works issued are, 'The Historical Monuments of Greenland,' and 'American Antiquities; or, Northern Writers on America before Columbus.' Both of them have thrown great light upon the history of the new continent; and the latter has clearly proved that, long before the time of Columbus, North America had been discovered by the Greenlanders.

The society is divided into sections; as the Asiatic section, which is devoted to the investigation of the relations of Asia to ancient Scandinavia; the Russian section, &c. A special committee is charged with the duty of attending to the increase and support of the museum. Their memoirs are published in Danish, German, French, and English; and a periodical, with essays on the history, archæology, and philology of the north, is also issued. These publications are for the most part only accessible to the learned. But in order to keep alive the interest of the people in antiquarian matters, they have proceeded to issue short popular papers on such subjects. The consequence is, that additions to the museum are continually pouring in from all parts of the country; and as the names of the donors are published in the official gazette, the public is made acquainted with the progress of the institution, and with those who are interesting themselves in it. The collection has thus become very important. Considering, however, that it is but twenty years since its formation, during which time not half the barrows in Denmark have been opened, and that the extensive morasses and bogs are depositories of antiquities which in a thousand places have not been disturbed by the spade and plough, we may readily infer that great riches have yet to be added. No doubt many, very many valuable pieces of antiquity have been now irrecoverably lost, but certainly, during the forty years' existence of the museum, an astonishing number of gold crowns, rings for the head, arms, and fingers, &c. have been brought to light. Some of these gold articles contain more than a pound of pure gold. Whole chests of amber ornaments have been brought together; and one discovery alone in Jutland produced 3400 pieces of amber, pearls, and other objects.

The museum is arranged in historical order. It commences with things of the Age of Stone—when the Scandinavians were yet ignorant of metal; when they slew their game with stones, felled trees, planed them, sawed them, and bored them with stones; when a stone served for a razor, for ornaments, and instruments of war. Many of these stone articles have been wrought with a labour truly wonderful. Knives, with handles richly adorned, and with keenly-sharp edges; arrow-heads, incomprehensibly thin and fine—these were the result of an art which the ancient artists in stone practised with ease, but which is lost to us. An antiquarian friend of mine told me he had offered a sum of money to a stone-cutter to make him an arrow-head in the old style out of a piece of flint, but it could not be done. It is surprising that they do not obtain a man from

some country where the art is still in being, at least to show them what the mode of working is. It surprises me also that engravings are not made of the most remarkable barrows, since there are many which, when engraved, would form very suitable ornaments for the museum. There need be no fear of such a collection of drawings looking uniform and monotonous, for the difference of situation and accompaniments would prevent this. One lies in the shade of noble beeches, another on the shore of a fiord, a third on a wild desolate heath, a fourth on the summit of a hilly ridge: sometimes a village church stands between two, sometimes one is planted round with gigantic stones.

A great part of the earth's inhabitants are yet in the Age of Stone, and we are here permitted to compare the productions of to-day in that line with ancient specimens. We see here the workmanship of the Greenlanders, of the South-Sea Islanders, and of the American Indians; and it is really remarkable what similarity prevails throughout between these and the Scandinavian productions. Two thousand years, or two thousand miles, might separate the labourers, still there is extremely little difference to be perceived between the vessels and implements of trade in shape, use, or make. They all seem to be turned out of the same workshop. Of some objects the visitor sees complete suites, as well as a great number of varieties of the same class grouped together. For instance, there are hundreds of hatchets small and large cut out of flint, serpentine, porphyry, and other minerals. There are also arrows and darts of all sizes, and shapes, and material. We are likewise shown suites of things in various stages of manufacture. Thus we see the block of flint out of which a little oblong fragment has been splintered to form the head of a lance. One sees the surface whence it has been taken, the fragment itself, the instrument inflicting the blow by which the severance was effected. Then we are shown such a fragment upon which the workman has bestowed some labour, but only half-completed his work; then a perfect lance-head; and lastly, one that has been used in battle or in the chase, and has got damaged. There are the grindstones upon which the points of arrows and the edge of hatchets have been sharpened. There are many long fragments or chips of flint which are very remarkable. They are often quite thin, an inch broad, and six or seven inches long. They look exactly as if they had been cut away with a knife when the stone was soft; for they are somewhat bent, like chips of wood. Yet connoisseurs affirm they were separated by a blow from the parent block. Still, the uninitiated, when they find nothing of the sort can now-a-days be done, are sceptical.

After the relics in stone, those in bronze and copper, with which some rooms are occupied, catch the attention. Copper and gold are the metals which have been almost everywhere first discovered. They are both more easily obtained, melted, and worked than silver, iron, and other ores. There is here a very extraordinary number of bronze swords, poniards, axes, rings, chains, buckles, saws, drinking utensils, spoons, scales, and other things, of which the neatness, taste, and beauty of the workmanship are quite astonishing.

It has been said that civilisation smooths away all peculiarities from different races, and that all nations are becoming more and more alike. In support of this position, it is usual to cite the uniformity of dress and other matters that is extending year by year, so that people of different nations are not distinguishable from external appearance. The old national costumes are disappearing from all nooks and corners of the world, and one sees the same kind of coats, waistcoats, and cravats, the same furniture, and similarly-disposed rooms, wherever we go: and no wonder, when we consider the great and ready intercourse which the world now enjoys. In this northern museum, however, we learn that even in the old times there was such a universal fashion in Europe in many things, as there is now in clothes and furniture. The old bronze swords and poniards, for in-

stance, which are dug up in the north, have precisely the same form and ornaments which are found in Thrace and Macedonia, or in the barrows of Troy. It might be thought that the Trojan and Scandinavian weapons had been executed by the same person, so strong is the similarity. Now, this is remarkable, when one remembers the few roads and means of intercourse which Europe then possessed. They show in this museum a round and artistically-wrought shield of bronze, which gives a very high idea of the skill of the old smiths. Perhaps it may have inspired some ancient scald, as the shield of Achilles did Homer. The barrows which were erected on the shore of the Hellespont to Hector and Ajax, are exactly like the barrows which commemorate Odin, Thor, and other Scandinavian heroes. Such things prove, it seems to me, that the European nations had formerly a more intimate acquaintance with each other than we usually allow them; and this intercourse generated a uniformity in the spirit of the age.

It is impossible to say in what century stone-work gave way to copper and bronze. No doubt there was a period when all were used—a kind of transition age. Many learned men believe that shortly before the birth of Christ there was an emigration from the south to the north, and that the use of iron then became known. We see here bronze implements which have been edged with iron, as if it were something costly—a bronze dagger, for instance, fortified with an iron edge; a bronze hatchet, to which a rim of iron has been riveted, &c. There are many specimens of iron implements from heathen times. The want of silver articles is somewhat strange, when the collection is so rich in gold.

I was particularly interested with the runestaves and other old runic writings, of which so many have been discovered in various countries. A French gentleman, who lately published a work on the Germans, makes himself merry with that nation for tracing out, as they conceive, evidence of a derivation from them amongst all other people in the world. The Gascons, Burgundians, and Spaniards, are attempted to be shown to have German blood, and the mountaineers of Crim Tartary and the Caucasus are supposed to have marks of a common origin in their light hair; whilst to the inhabitants of the country about the African Atlas, the Germans stretch out a hand of brotherhood, because they are considered descendants of the Vandals. The Slavonians, inspired by nationality in the same way, detect Slavonic names amongst the villages of Germany, find Slavonic names of cities in Italy, and delight themselves with the old alphabet—the far-famed Testament of Rheims. The Scandinavians do the same thing with reference to their runes and other northern monuments; and from this zealous patriotism history has derived much advantage. Not only in all parts of Sweden, Norway, and Denmark, not only in Northern Germany, Iceland, and Greenland, but also on many rocks of North America, have runic carvings been discovered, copied, and interpreted. It is true that the interpreters have occasionally quarrels with the naturalists, because these latter attribute to diluvial scratching what the former take to be runes. However, in most instances the antiquarians have carried the day. Even Italy has not been an unproductive country for runes and Scandinavian remains. A manuscript of the ninth century has been found in Naples, in which the northern deities, particularly Odin and Freia, are represented; and what is very remarkable, a line of scribbled signs, which some inspectors declare to be runic, have been discovered round the body and back of the lion in St Mark's Place, Venice. A cast of these characters is in the museum; some of them have been deciphered, but others are perfectly unintelligible. It is to this day an enigma how the signs got upon the lion's body.

Large as the museum is, it is rapidly increasing. Seven hundred new specimens were sent in one year lately, but four hundred or five hundred per annum is

the average rate of increase. So splendid a collection could only be formed where an active spirit of patriotism is stirring amongst the people. Their love of their country and of ancient things is manifested in the shops, where the booksellers deal largely in Swedish, Danish, and Norwegian literature; and there are many establishments for the sale of antiquities—old curiosity shops.

OUR CORRESPONDENTS.

THERE is a skeleton in every house—something secretly tormenting—so says the Italian proverb; and we can well believe it. Our skeleton consists in the supposed obligation to read all the letters which the postman so obligingly brings us every morning—on Monday twice as many as on any other day.

What are all these letters about? On the same principle that father confessors are heard to say that they do not remember one word out of a whole day's self-accusatory depositions, we can scarcely give any reasonable account of these epistolary revelations. Some are modestly asking questions which it would require a sitting magistrate or a Highland oracle to answer. Some are abusing us as everything that is bad, because, as it would seem, we dare to think differently from their learned writers on subjects of great public concern; as, for example, because in the fifteenth line of page seven in a late number we had the audacity to spell *color* colour; or because, in speaking lately of a certain brown butterfly, we said it had eight legs instead of six. No one but an idiot, they tell us, could have made such mistakes, and they would advise us to go back to school! How happy the writers of these 'ticklers' must be after dropping them into the letter-box! In contrast with these snappish and generally anonymous correspondents, we would place those who, writing with temper, are not afraid to append their names to their suggested corrections. Of this latter class the following is an agreeable specimen:—

**Electric Telegraph, Derby, Dec. 23, 1846.*

GENTLEMEN—I have just read a paper in the 147th No. of your Journal, "Whimsicalities of the Electric Telegraph." You will perhaps excuse my directing your attention to that portion of the article which is quoted from "*the Globe*," stating that the small birds which frequently congregate on the wires receive shocks when the instruments are in action. This is the common opinion, but allow me to suggest, that it is necessary that the bird form a part of the circuit, or it cannot be acted upon by the electricity. In our system of wires, the current passes from terminus to terminus along the wire, and returns by the earth. If we attach the most delicate galvanometer to a wire along which the current is made to pass, no effect is observed till we also connect it with the earth, and complete the circuit. Thus no bird can receive a shock, unless it is tall enough to stand on the ground and touch the wires; and even if such a monster were to attempt experimenting, the feathers of its head, and even the horny skin of its feet, would not act as conductors, unless well wetted.

*I have the inspection of above two hundred and thirty miles of line, or more than one thousand miles of wire, and I never saw any effect of the kind, nor have any of our staff on other lines. Birds, however, are frequently found dead under the wires. I have seen a wing hanging on them, and on searching, have discovered its owner on the grass below. Our men have frequently seen partridges fly across and kill themselves, not by a shock of electricity, but by striking themselves forcibly against them. I am sure that your well-known anxiety to afford the most correct information on the subjects which you notice, will afford me an excuse for thus trespassing on your patience.

*Between Norwich and Yarmouth I have often seen two hundred or more sand martens on a wire whilst the

instrument has been in action, sitting as contentedly as possible: in fact the wires are a very favourite perch for these birds. During thunder-storms, even on short lines, the needles are violently affected, and the bells ring incessantly.

Another very general but erroneous idea, even among the better order of folks, is, that the humming Æolian harp-like effect of the wind on the suspended wire is caused by the "*messages passing*." Some even say they can tell when a train is coming by the noise.

On all long lines some inconvenience is experienced by an occasional deflection of the needles, which change from left to right rapidly, and frequently perhaps four times in ten minutes. At first sight, it would seem to be merely the effect of an atmospheric current of electricity passing along the wires from the clouds to the earth, and *vice versa*; but there are many cases which cannot be explained on this theory. No effect seems to take place unless the wire is connected at each end with the earth.

At Derby we have four lines, which diverge respectively to Normanton, Lincoln, Rugby, and Birmingham. In forty-nine cases out of fifty, if the first two instruments are deflected to the right, the last two point to the left; sometimes all are alike. The left-hand end of the galvanometer coil is in each instrument connected with the suspended wire, the right-hand end with the earth, so that a similar current passing along each wire would cause all the needles to point one way. And why, then, do they move in pairs so generally?—I am, &c.

R. S. CULLEY.

The next class of contributors are poets, and they are the most numerous of all. No one but the editor of a literary periodical can have the slightest idea of the number of persons who write, or suppose they write, verses. One day when we have time, we mean to do justice to this meritorious order of geniuses, by presenting specimens of their claims to immortality. We shall not have more than a hundredweight of note-papers to look over. Meanwhile, to be serious, we would earnestly commend the too prevalent practice of wasting time in versification, in which mediocrity is not only intolerable, but profitless.

Contributors of prose are not a large body, and their aims are usually less romantic than poets, and come nearer the kind of material we require. A few writings are good, some are bad, but the penmanship of many is so confused, that we really are not able to read or give any opinion on them. This leads us to impart some advice-editorial, worth their weight in gold, to all aspirant contributors. They are these:—Write in a large round hand, and only on one side of the paper. Inscribe your name and address on every article. Don't expect the article to be returned, if unsuitable, because to send back formally all the papers forwarded, would occupy a most unreasonable portion of time. If you wish to preserve what you have written, keep a copy. By attending to these rules, you will greatly oblige not only us, but all editors whatsoever. The thing that worries the unfortunate race to which we belong, are the numerous letters requesting the return of papers of which they have no recollection, and which are lost amongst a mass of contributions put aside as unsuitable.

We have pleasure in stating a somewhat curious circumstance connected with prose contributions. Apart from the papers of professed female writers, considerably more articles suitable for our purpose are contributed by ladies in Ireland than in England; while very few of any kind are sent by ladies in Scotland. It may add interest to this unexpected announcement to state, that the greater number of the Irish ladies who furnish acceptable contributions are either the wives or daughters of clergymen of the established church. It is at any rate a strange fact, that a number of these pages are filled with material from beyond the Shannon.

The last class of contributors whom we need mention, are persons of both sexes who sympathise in our efforts at social melioration, and hand us accounts of what

they or others about them are doing in the same cause. Some of the letters of these parties are exceedingly interesting, for they reveal the breadth and depth of the operations now in progress for cultivating hitherto waste and neglected intellect. They also often show how much good may be done by only a small sacrifice of time, trouble, and means. The following extract from a letter, received a few days ago from a gentleman in Chester, will convey an idea of this species of activity:—

The writer begins by asking the gift of any spoiled copy of a work on mathematics, in order to give it to a poor lad whom he has gratuitously taught, and inspired with a thirst for knowledge. As an argument in favour of his claim, he goes on to say, 'During the whole of last winter I gave gratuitous instruction to as many of the excavators employed in the formation of the railways in the vicinity as chose to avail themselves of it. The average nightly attendance was about fifty; and during that period three hundred men, the greater number of whom were in a state of entire mental destitution, received elementary instruction. The whole of them learned to read and write; many acquired also the elements of arithmetic; and nearly fifty of them, among whom was the young man above referred to, made so great a proficiency, as to justify the hope that it would have a decidedly beneficial influence on their future career. I may add, as another result of my labour of love, equally gratifying, that thirty-five men, previously very intemperate and dissolute characters, took the pledge of total abstinence. I have occasionally presented copies of your books to individuals who I supposed would value them; but as my means are limited,' &c. A copy of the book was sent.'

The following letter from a young man, the librarian of a Self-Improvement Society at Uxbridge, speaks for itself.

SIR—Some few weeks ago you inserted in your Journal a short account of the Uxbridge Young Men's Improvement Society; that insertion has conferred a benefit upon that society which the members will not soon forget, and for which, lacking more suitable means, we now most respectfully and sincerely tender you our grateful acknowledgments. Within a very short time of the publicity thus given to our proceedings, we received a number of letters from different parts of the country in reference to that account; some congratulating us upon our prospects, some inquiring for our rules, and further particulars; whilst, in two or three instances, there were offers of assistance, in the shape of London and other newspapers, to be sent a day or two after publication by the post. And here I would state that, by a curious coincidence, one of our members had a West Indian paper sent him a few days back, in which he saw an account of his own society, as copied verbatim from your Journal, although the person who sent it had no knowledge of his being a member. These things, sir, you may rest assured, did not pass unheeded by us—they stirred up the feelings of the coldest hearted; we one and all felt it would be a shame and disgrace, indeed a lasting stigma upon us, if, after having been thus honoured by and through your means, we did not strive with all our might to render ourselves every way worthy of that honour.

A general meeting of the members was at once called, at which it was resolved to have the rules printed, a copy of which I have taken the liberty of forwarding for your inspection. A public tea-meeting was next resolved upon, to be held on Tuesday, October 6, and which, by the kindness of some persons in authority, we were enabled to hold in a large room over the market-place; for you must know, sir, however large we may appear in print, we have at present but a small room to meet in. Fifty-five persons sat down to tea, which we begun and finished by singing a verse of thanksgiving. After tea, a public meeting was held, at which R. Wilkinson, Esq. a gentleman well known in the town, presided, and commenced the business of the

evening by congratulating us upon our prospects, enrolling himself as a member, and presenting ten volumes of useful works to the society. The report was then read, by which it appears that we have, during the last twelve months, nearly doubled our members, together with the number of our books; that we are at present in good working order, and bid fair to gain the respect and good wishes (for aid we do not ask, except in books; as it is a maxim with us to create as far as possible in the young men a feeling of self-dependence) of the influential portion of our neighbours. A number of books were then formally presented to the society, among which were two volumes, strongly bound, of "Chambers's Information for the People;" "Life of R. Burns;" "Walker's Dictionary;" "Crossley's Intellectual Calculator," &c. According to the plan laid down, the meeting was then addressed by several young men, members of the society, who, apparently to the satisfaction of the audience, made up in zeal what they lacked in experience. Mr Stamper, the Independent minister, very kindly patronised us, by speaking for about ten minutes during the latter part of the evening. At a quarter to ten o'clock we broke up; most of the young, and indeed many of the older folks, declaring they had not spent so pleasant an evening for a long time. We have at the present time eight or ten persons to propose as members, all shopmen; a likelihood of getting a suitable room in the Town-Hall for a constancy; with other advantages too tedious to mention; and all through what we can most justly say the impetus given to us, just in the nick of time, by your insertion of that account; for you must know that your Journal is well circulated in Uxbridge. That it may long continue to flourish, and be the means of stirring up the same spirit which it has done among my fellow-members, is the sincere wish of

E. AUSTIN, Librarian to the Society.'

Of the necessity for instituting societies of the above nature, and, above all, for teaching people to read works of even an ordinary description, we have an example in the following communication from a lady in Norwich:

I have been asked to-day, by a member of a District Visiting Society in this city, whether you publish any serial tracts calculated for a lower grade of intellect than your "Useful and Entertaining Miscellany." My friend says, that in all the houses of the poor belonging to her society (a congregational one) I should either find your Miscellany lent to or read to the poor, but that often there come numbers which they cannot understand; and she wishes you could put forth a *lower* series. I know much of the poor in the country, and I have long thought that a light magazine, with a little natural history, domestic management, anecdote, sober poetry, and plain-sense morality, would be a treasure to many a fireside. I have vainly endeavoured to persuade booksellers that such a work is wanted. The only one who saw the want would not join me, because it required canvassers. Pray think of this. I fear, or hope, your intellectual Scotch labourers are not aware of the appalling ignorance of our farm-servants. Our artisans are rising; but alas for the condition of our peasantry! They seem to have no one to stir them up, nor can they stir up themselves.'

The suggestion to write and publish a series of tracts in language suitable to a child-like understanding, with a view to the instruction of English peasantry, is no doubt humane, but, like many other good ideas, it is impracticable as a matter of private enterprise. No peasantry, we fear, not even those of Scotland, buy books of general instruction or amusement; and if the truth must be told, the lower classes, so called, in towns, buy nearly as little. It is quite a mistake to suppose that the humbler order of manual labourers buy our sheets. In vain do we try to reach them with our literature; in vain cheapen tracts to the verge of being non-productive. There are of course exceptions to the rule; but the fact is well known to booksellers, that it is the better class of tradesmen, and middle classes of people generally, who buy nearly all the cheap publications

whatsoever. That this is not altogether owing to an indisposition on the part of the operative classes to possess themselves of these publications, but is in a great measure a consequence of existing and ineffective processes of distribution, we shall afterwards attempt to show in a separate article on the subject.

THE DOG OF BRUSSELS.

Does the reader love dogs? If he does not, let him skip this article, for with the dog-hater I have no sympathy. But to some one, methinks, the question will bring back the remembrance of his own faithful Dash, whose delight on the first important day of partridge-shooting was not less evident than that of his master. Or perhaps some single gentleman, who would yet be far from willing to class himself among the fraternity of old bachelors, will give a kindly glance at the little rough wire-haired Scotch terrier, his constant companion by night and day. A mother, too, may look with kindness at the old Blenheim spaniel, which, averse to the carresses of strangers, and discouraging too great familiarity from the seniors of the family, will patiently endure the closest hugging from her baby boy, and return with gentlest love the somewhat rough and teasing fondness of the elder archins. How well does she remember the day when her wild rosy-cheeked Frank, emancipated from the control of his teacher, whom he somewhat disrespectfully designated a 'she-governess,' in all the independent manliness of his eighth summer and first cloth jacket, ran down to the river to fish for minnows. His only companion was the brave Newfoundland, Neptune, which sat gravely on the bank, watching with a philosophic eye the progress of his young master's sport. Suddenly the boy leant over the bank, the treacherous sod gave way, and the bright curly head was plunged beneath the waters. It was but for a moment; for when the terrified herdsman, whom the child's wild scream had drawn to the spot, came up, he saw the boy's dress tightly grasped in Neptune's powerful jaws, and the dog's massive fore-feet firmly planted on the bank, where his master's child was soon laid in safety. Poor Neptune is now old and feeble; the most he can do is to crawl on a fine day from his nook near the kitchen fire to the sunny step before the hall-door. There he lies, certain that his mistress and her daughters will never pass him by without bestowing a gentle pat on his head, and a bit of soft cake, which he can still masticate. But when the midsummer holidays come, and the fine tall lad, who is to enter college 'next half,' bounds towards the door, then the poor old fellow rises with unwonted alacrity, and something like the sparkle of former days gleams in his dim gray eye as he meets and returns the carresses of his dear young master Frank.

But let me come, without further preface, to a true anecdote with which I became acquainted during a visit to Brussels in the year 1837.

After visiting many of the interesting objects which that pleasant capital offers to the notice of strangers, my companion and I turned our steps towards the Chamber of Deputies. The building is extensive, and occupies three sides of a square, the fourth being open towards the parks. There is a large smooth court in front, which forms a pleasant promenade; but in one corner of it, and somewhat marring the stateliness of the scene, I noticed a common little wooden dog-kennel, which I supposed to belong to a watch-dog. Humble as was this little tenement, it was connected with an incident, of which I had the following history from my lognacious conductress. 'Here,' she said, 'in this Place was the fiercest fighting in the revolution of 1830; for several days after the battle the ground was red with French and Belgian blood.'

Just then a shaggy-looking dog, somewhat resembling a large terrier, but, as I thought, an ugly specimen of his race, walked slowly towards us. He looked good-natured, and I stooped to pat him.

'Ay,' said the old woman, 'madame may caress him now with safety, as he is not on the spot.'

'What spot?' I inquired; and in reply she told me the following anecdote. 'In the revolutionary army that assembled to oppose the Dutch, who invaded our city in the month of September 1830, was a young French officer, who, wherever he went, was followed by the dog you see. The poor lad was in the thickest of the fighting on the fatal 21st, and fell, covered with wounds, on a spot which I will show you.'

She led me towards the centre of the court, but the dog went before, and lay down near a smooth stone, looking up at us with an expression of fierce defiance in his eyes.

'Ah, poor fellow!' said the old lady, 'we're not going to disturb you. Don't go near him, madame, while he's there. That was the spot where his master's dead body lay, and he sat beside it, licking the bleeding wounds. At length it was removed for burial, but the dog followed it, and stayed for three days beside the grave. At the end of that time he returned here, and lay down where you see him now, growling savagely, and attacking any one who tried to dislodge him. Some of the people about beat him with sticks, and drove him away; the next day he returned, but was again cruelly hunted off. When he came back for the third time, he was worn to a skeleton from fatigue and hunger, and looked as if he would never rise again from his master's death-place. My husband and I had gone away for a while, or we would not have suffered the creature to be ill-treated; but one of the directors, who is a very humane man, chanced to pass by just as a rabble of boys were preparing once more to torture the poor faithful dog. He immediately dispersed them, and having inquired into the circumstances connected with the animal, he ordered that he should never be molested; that the kennel which you see should be built for him; and procured a small sum to be allowed weekly for his maintenance. He soon recovered his strength, and you may see by his appearance that he is taken good care of. Indeed he is well known in the town; and the little masters and misses that play in the park delight in bringing him sweet cakes, of which he is very fond. However, they know very well that although he is as gentle as a lamb while he is walking up and down, they must never attempt to touch him when lying on his chosen spot, from which, indeed, he never stirs in any direction farther than about a hundred yards. Many of his young friends have tried to entice him to a greater distance; and we have sometimes allowed him to be hungry, and then coaxed him on with his most favourite food; but in vain. He always turned back, and lay down where his master fell. Seven years have now passed away, but it is still the same; the dumb creature never forgets!'

During my stay at Brussels I often walked by the place, and never missed the dog from his accustomed haunt, nor saw him pass the self-imposed limits mentioned by the good woman. Her story was confirmed to me by others, so that I can see no reason to doubt its truth. I do not know the name of the dog of Brussels: his faithful limbs have no doubt long ere now mingled with the dust, but memory often recalls the story of his enduring love.

Perchance the tidings of his young master's fall brought darkness to the chambers of some vine-covered cottage of France—robbed fair faces of their smiles, and covered graceful forms with the garb of woe. They wept and lamented; but a year passed over, and the brothers and sisters laughed and conversed as before. The vacant place of the dead was no longer heeded, and his name had become an unspoken word. Another year, and his fair affianced one had consented to become another's bride. No tear in that bright eye, no shadow on that smooth brow, now told that even one sorrowing thought ever turned towards his lonely grave.

Years still passed on, and even in the widowed mother's heart the memory of her soldier boy waxed dim.

She did not forget him quite, and often some trifling object or event would serve to renew her grief. But at other times she could sit and smile, pleased and contented, as though that sharp sorrow of bereavement had never been felt. The brothers and sisters had each other still—the fair betrothed had another lover—the mother had many sons—the dog had but one master. Fond and faithful to the end, with constancy that knew no change, that dumb creature's cold vigils on the stone at Brussels put evermore to shame our vaunted human love.

IT'S NOT FAIR.

THE following piece of drollery is extracted from 'The Bairnsa Foaks' an' Fogmoor Olmenack, for 1847, be Tom Treddlehoyle, Esq.—an almanac in one of the provincial dialects of England, and therefore a curiosity in its way:—

'It's not fair for a chap to cry "cockles alive," when at the same time he naws thare all dead.

'It's not fair, when onny boddy goaze to a grocer's shop ta bye coffee, and thay gie em it hauf chickory an mahogany sawdust.

'It's not fair, when you goa for a stoan a flaar at hauf a cran, an they gie yo that at two an tuppance.

'It's not fair, when you goa for hauf an ance a bacca, an thay weicht paper we it.

'It's not fair for a chap at sells milk, to goa tut pump before he goaze tut cah.

'It's not fair, when a woman goaze to buy a bit a tea, te hev aloe leaves an black-lead amang it.

'It's not fair for a dressmaker to put folks off, be sayin at thave sum mournin cum in, when at same time thave nowt at soart.

'It's not fair, when a bairn goaze tut public-hause for a penarth a yist, an't landlord or't landlady tells it they hev noan ta spare, eos it father duzant goa an drink thear.

'It's not fair for a chap at macks hate, ta print or write "waterproof" it insides on em, when at same time he naws at thale run like a riddle.

'It's not fair for a womman at goaze ta bye butter, ta scrape abit we hur thun-nail off a ivory hauf pound homast at thear iz it market.

'It's not fair for gentlefoaks, when they want a job doing, to hurry it be sayin at thave sum cumpany cummin, when at same time thay nowt at soart.

'It's not fair for a chap at's ridein in a railway carriage, ta hev't windaz hoppand and shut just as heeze a mind.

'It's not fair for a womman ta goa into a linen-draper's shop, an, after looking an tummalin ivverything over at thear iz it plaice nearly, goa aught wethaught beyein owt.

'It's not fair for a chap ta hoist hiz umbrella aghtside a coach on a rainy day, an speaght watter into urther foak's neck hoyles.

'It's not fair for a doektor to goa tut chereh or chappil, an leave word for him ta be fetch't aght it middle at sarvice, when he naws he izant wanted.

'It's not fair, when a man or womman leaves a cumpany, for them ats left ta backbite abaght am.

'It's not fair, when you go into a barber's shop to be shaived, te hev yer noaze-hoyles stopt up we lather, or hev yer chin cut.

'It's not fair ta bid onny boddy a good mornin, an at same time not mean it.

'It's not fair for a tailor allas ta want as much cloath for a little man as he dux for a big un.'

A lady suggests to us that there is one 'It's not fair' omitted, and she requests us to supply it.

'It's not fair, when you buy a reel of cotton, to find that, except a little thread on the outside, all the rest is wood.

MANX SUPERSTITION.

The Manx place great reliance on fire protecting them from the influence of evil spirits. Not a family in the whole island, of natives, but keeps a fire constantly burning, no one daring to depend on his neighbour's vigilance in a thing which he imagines of so much importance, and every one firmly believing that, if it should ever happen that no fires were to be found throughout the island, the most terrible revolutions and mischiefs would immediately ensue.—*Train's Isle of Man.*

HAPPINESS.

As in the sun the dewy violet trembles,
Trembles my spirit now with joy's excess,
So deep, that pain itself it nigh resembles,
Brimming with wordless, tearful happiness.
Oh let the incense of a thankful heart
Ascend to Heaven, as perfume from the flower,
That, seeing winter's shadow grim depart,
Lifts up its head unto the sun and shower;
Yet not forgetting, in the soft spring days,
The storms and frosts through which it safe has past;
Wearing life out in glad and lovely praise,
And calmly sinking down to earth at last,
Having its course fulfilled. Oh, then, may I
Thus thankful, hopeful live, and thus contented die!

D. M. M.

THE EDUCATION WHICH HALLOWS EXISTENCE.

A man is not to be considered as educated because some years of his life have been spent in acquiring a certain proficiency in the language, history, and geography of Greece and Rome, and their colonies, or in bestowing a transient attention on the principles of mathematics and natural philosophy; nor is a woman to be considered as educated because she can execute a difficult piece of music in a brilliant style, or speak French, German, or Italian with fluency. Such attainments require little more than mere mechanical recollection—the lowest of all the cerebral faculties; or the rapid transmission of an impulse from the sensitive optic nerve to the motor ones of the arms and fingers, which is nothing better than the instinctive movement of the animal; neither can the storing up the opinions of others, or the accustoming the tongue to the idioms of other languages, be properly termed an act of thought; for in such cases the capacity of combining ideas, of weighing and judging ere a course of action is adopted, remains even less exercised than in those who, though they are turned into the world with the mind, as it were, a *tabula rasa* to receive any impression, and too frequently a bad one, yet amid the difficulties and sufferings of poverty, sometimes learn to think. It is from the depths of man's interior life that he must draw what separates him from the brute, and hallows his animal existence; and learning is no farther valuable than as it gives a quantity of raw material to be separated and worked up in the intellectual laboratory, till it comes forth as new in form, and as increased in value, as the porcelain vase which entered the manufactory in the shape of metallic salts, clay, and sand.—*Connection between Physiology and Intellectual Philosophy.*

THE SPIDER'S THREAD.

That any creature could be found to fabricate a net, not less ingenious than that of the fisherman, for the capture of its prey; that it should fix it in the right place, and then patiently await the result, is a proceeding so strange, that, if we did not see it done daily before our eyes by the common house-spider and garden-spider, it would seem wonderful. But how much is our wonder increased when we think of the complex fabric of each single thread, and then of the mathematical precision and rapidity with which, in certain cases, the net itself is constructed; and to add to all this, as an example of the wonders which the most common things exhibit when carefully examined, the net of the garden-spider consists of two distinct kinds of silk. The threads forming the concentric circles are composed of a silk much more elastic than that of the rays, and are studded over with minute globules of a viscid gum, sufficiently adhesive to retain any unwary fly which comes in contact with it. A net of average dimensions is estimated by Mr Blackwall to contain 87,360 of these globules, and a large net of fourteen or sixteen inches in diameter, 120,000; and yet such a net will be completed by one species (*Eperia apoclica*) in about forty minutes, on an average, if no interruption occurs!—*Introduction to Zoology.*

HISTORICAL TABLEAUX.

TUTELAGE.

WERE we to ask a hundred men, who from small beginnings have attained a condition of respectability and affluence, to what they principally imputed their success in life, the general answer would be, 'It was from being early compelled to think for and depend on ourselves.' And, on the contrary, if at all curious as to ruination of prospects, a little inquiry would suffice to show that it was too commonly a result of having acquired no powers of self-reliance—of the whole of youth and part of manhood having been spent in a fatal dependence on others.

This would appear to be one of the unbending laws of nature. Not allowed, or not compelled to exercise itself, the mind becomes feeble, and incapable of independent thought; its proper energies cease to be evoked; and in many respects it is little better than the mind of an infant. Persons living in morbid indifference to surrounding circumstances, individuals whose whole waking existence is spent in the drudgery of mechanical occupations, and those whose movements are altogether regulated by others, usually possess minds of this emaciated character. Comparing such unfortunately-situated persons to plants secluded from the free action of the sun and atmosphere, their mental capacities may be said to be *etiolated*—robbed of all natural strength and beauty.*

What is true as respects an individual, is true as regards communities of people, and also whole nations. In Great Britain, at the present moment, there could be pointed out extensive rural districts, and likewise towns, the majority of whose inhabitants are evidently behind the rest of the country not only as respects an alert apprehension of knowledge, but the capacity to think and act according to the plainest principles of morals. A habitual trust in some kind of petty patronage, a reliance on antiquated immunities and advantages, and the want of frequent intercourse with the world, are in these instances the prevalent cause of mental deterioration. Nothing, as is well known, is more common than for persons at elections for members of parliament in certain towns in England to make a trade of selling their votes for sums varying from five to fifty pounds. One town so unfortunate as to be detected in these corrupt practices has lately been deprived of its franchise. It has always, however, been quite impossible to convince the inhabitants of such places that they are guilty of an

immoral act. With minds deteriorated and depraved, they are heard to defend what all the rest of the world condemns; and I have no doubt of their sincerity. When to the debasing influence of bribes—as happens with a town of some note which I have in my eye—are added large corporation advantages in the form of patches of land rent-free, the demoralisation eats into the very core of society, and produces the most lamentable abasement. Relying on these miserable chances of plunder, and on endowments which may properly be called bounties on indolence, the inhabitants linger out a dreary existence, poor and unenterprising, venal, subservient, and thankless; and, worst of all, deprived of that vigour of intellect which could show them the infamy of their unhappy condition. For persons so diseased there is no hope, unless from an entire change of circumstances. Removed to scenes of mental activity, they may possibly be cultivated into the possession of qualities esteemed by the good and generous. 'Etiolated plants become green by exposure.'

There are numerous instances in history of entire nations becoming etiolated. From being bold, enlightened, and enterprising, they have become timid, ignorant, and inert; from being able to manage themselves, they have come to need some one to think for, to feed, clothe, and defend them, as if they were children. There are other examples in history of youthful nations remaining in a kind of etiolated state up to a certain point in their progress, and then, through a conjuncture of circumstances, assuming a healthful and vigorous frame of mind; the rule in these, as in the preceding class of cases, being the same—mental vigour only where there is full scope for mental exercise. Let us group a few of these various conditions of national character in our tableaux.

Military conquest, as was observed in a previous article, has been the principal agent of national ruin. There has always, however, been something besides. All depends on the sequence of action. Battles, slaughter, devastations in taking possession of a country, do not usually last long. The killing, the smashing, and the pocketing are soon over. A nation exposed to the calamity of conquest, may no more be prostrated by the event, than a man may be ruined by having his house robbed. All, I say, depends on what the plunderers do afterwards. Conquerors take possession of countries for one of two avowed purposes—either to make the new country their home, or to keep it on the avaricious principle of a led-farm. If they design to remain, casting themselves at the same time loose from their previous settlement, the conquest is usually conducted with temper and discretion. 'The wicked man turneth away from his wickedness that he hath committed, and doeth that which is lawful and right.' In other words, the victorious party performs an act of clemency and justice.

* Etiolation is that condition of a plant in which all the green colour is absent. Such a state is produced by want of light, and is artificially obtained by keeping plants in the dark, in order to insure their being more tender and insipid than is natural to them. Etiolated plants become green by exposure.—*Brande's Dictionary of Science.*

A thorough central management, in which the natives participate, is organised; things gradually clear up; and the people at large, who were at first so much panic-struck, look on the affair as of no serious importance after all. The conquest of England by the Normans finally assumed this pleasant character. William was king in Westminster instead of Harold, and there was an end of it, or nearly so.

It is a very different thing when an invading host retires after it has inflicted its first dread blow, and leaves the country in a subjugated and denationalised condition. From that instant the people, no longer permitted, or called on, to think decisively for themselves, become gradually emaciated in mind—etiolated. Their noble faculties wither and die, while subserviency, and many base and pitiful passions, take their place. By far the greater number of conquests have been of this permanently-ruinous character. The Romans always adopted the plan of leaving their conquered countries in the charge of servants delegated from headquarters; at one period they had as many as twenty large states tributary to their treasury, and undergoing this dismal process of demoralisation; each state, the longer it was kept, sinking the deeper into a condition of mental imbecility. Readers of history will here call to mind the character of the Britons at the final departure of the Romans, after four centuries of tutelage. From having been a courageous and active-minded race, they had become altogether poor-spirited, and incapable of planning any means of defence or self-government. Such was the abjectness of their situation, that they earnestly implored the Romans to remain for their protection. 'Stay, oh stay, to think, to act, to do for us.' A group of children left to shift for themselves could not have presented a more piteous spectacle of incapacity; and the Britons on this occasion were really deserving of pity. They could not be blamed for being etiolated. During four hundred years, a period of at least eight generations, they had, from father to son, never been allowed to interfere in public affairs. The Romans had managed everything, according to orders received by letters from Rome, or agreeably to certain laws, of which the Britons had no distinct knowledge, and for which they could entertain no respect. Driven almost out of their weakened senses by the refusal of the Romans to stay or come back to help them, and suffering from the vengeful incursions of the Scots and Picts, they sent an invitation to the Saxons to condescend to come and take charge of them. Never did mendicant pen so humble a petition. The following are the words, as given by a cotemporary historian of some credit:—'The poor and distressed Britons, almost worn out by hostile invasions, and harassed by continual incursions, are humble suppliants to you, most valiant Saxons, for succour. We are possessed of a wide, extended, and a fertile country; this we yield wholly, to be at your devotion and command. Beneath the wings of your valour we seek for safety, and shall willingly undergo whatever services you may hereafter be pleased to impose.' What a picture! England crying, 'Come, take me!' Poor etiolated Britons! We hope things were quite settled to your minds when Hengist and Horsa put brass collars round your necks, and sold you, as an article of commerce, at so much a dozen!

As the unfortunate Britons on this occasion passed under the yoke of the Saxons, so did the Greeks about the same period, and from precisely the same cause, sink under the thralldom of kindred Gothic tribes.

Emaciated in mind, corrupted, and subservient, they no longer showed a vestige of their ancient national character; and, deserted by the Roman power, which had coddled them to their ruin, they became a defenceless prey to the northern invaders. So likewise did Spain, which had cost the Romans two hundred years to conquer, drop with comparative ease into the hands of the Goths. Four centuries as a led-farm of Rome had taken away all pith from its mental composition. And so likewise with Gaul, and other Roman dependencies. Of almost every one of them the same sorrowful tale may be told. They all went on well enough so long as their Roman masters held them in charge; but no sooner had the pro-consular governments been withdrawn, in consequence of a general derangement of affairs at home, than each submitted itself to the keeping of tribes of energetic intruders. According to the accounts of historians, the Roman provinces became the prey of Teutonic races, in consequence of an effeminacy of manners introduced from Rome, and also from the East. Historians, in presenting this reason for the dismemberment of the Roman empire, wrote according to the philosophy of their times. A better knowledge of social economics, and of the working of the human faculties, now tells us that luxury and refinement are not always causes of national degeneracy. Rude conquerors, abandoning themselves to unaccustomed indulgences, will no doubt lose their original character, as was the case with the invaders of Italy. The same explanation, however, will not suit the class of cases to which we allude. In these, the *primary* source of ruination, as I apprehend, lay in the emaciation of the people's minds, from lack of proper exercise. Kept in a state of tutelage, and disheartened by conquest, their nobler faculties were repressed, and only the meaner class of feelings and appetites found scope for indulgence. Hence the universal ruin which ensued on the withdrawal of the Romans. The parallel was everywhere complete. In all the countries which that great nation acquired by conquest, there was finally found a mean-spirited, shuffling, and slavish population. Jew, Greek, Spaniard, Gaul, and Briton were all alike modified by differences of race. Every one of them was less or more etiolated. There can be nothing more clear, from the uniformity of these facts, than that delegated national managements are invariably demoralising, and effect more permanently-disastrous results than the first crash of rapine and military conquest.

As the world now stands, it would not be difficult to select countries suffering under an enfeebled state of intellect chiefly from the influence of despotic or delegated managements, both equally overshadowing and injurious. What example more remarkable than that offered by the whole of modern Germany. From this vast region issued the great and impetuous hordes which overran the Roman provinces, and imparted a solid foundation to many European states. After a lapse of fourteen hundred years since the occurrence of these events, we in vain seek for a remnant of the valour, once the terror of the world. Fruitless would be the search for the slightest resemblance between the ancient Sueri, Alemanni, Saxons, Vandals, Lombards, Franks, and other great Teutons—the races, in short, among whom our own liberties were cradled—and the etiolated modern German nations. First subdued by Charlemagne, himself a Frank, and afterwards, in detached portions, passing under the thralldom of his less magnanimous successors, they have finally shrunk into insignificance, and been lost to honourable European

history—a hundred millions of people in a state of tutelage, stifling the recollection of a great name in the fumes of an odious narcotic, heard talking of liberty only at inlanguishable tavern brawls, and with every action watched over and regulated by a crew of mounted barbarians. Such is Germany, only the less etiolated because of its naturally vigorous mental constitution. How humiliating the spectacle which greeted the sight a few years ago in the 'free' city of Frankfurt—cannons loaded with grape-shot pointing down the main street, and ready to be fired by a mixed Prussian and Austrian guard. An incomparable receipt this for national etiolation.

If desirous of seeing a few living specimens of mental deterioration, arising in no small degree from delegated management, the late Spanish dependencies in Central America will at once present themselves to our imagination. In these distant possessions the native races were barbarously annihilated, and the tributary states were peopled entirely by adventurers from the mother country. These settlers were by no means of inactive mental habits, and yet their descendants in Mexico and elsewhere have latterly proved their incompetency for independent national management. Ruled for centuries by a deputed and despotic authority, their attempts at self-government are among the most laughable things in modern history. Ignorant, idle, and quarrelsome, they would appear to be only waiting for a transatlantic Hengist and Horsa to put collars round their necks. And considering the manifold iniquities of their ancestors, who can pity them? Who also can entertain the smallest compassion for Spain, in this instance the great head-quarters of transgression? How startling for the present age to be called on to witness the punishment of outrages committed centuries ago by Cortes on the unoffending Montezuma!

Carrying our eye northwards along the American continent, we are presented with a lesson of another kind. Seventy years ago, Britain owned a number of dependencies facing the Atlantic, the seat of a peaceful and industrious population. Governed on the led-farm principle, there cannot be a doubt that the inhabitants would in time have become etiolated, and unfit for any independent line of action. A strange piece of mismanagement, however, on the part of the mother country saved them from this disaster. One day in the year 1764, an aged military gentleman presented himself to an assembly of notables in these distant settlements, and communicated orders to the following effect, in answer to certain remonstrances previously sent to the mother country:—'In the first place,' proceeded he, 'you, the people of this led-farm, are not in future to buy any article of manufacture whatsoever from any country but England. Secondly, you are not to sell any of your produce to any country but England. Thirdly, all the articles you buy from England shall pay a tax before you get them. Fourthly, you are not to manufacture a single article yourselves, in order that English tradesmen may not be cheated of your cash. Fifthly, these, and all other arrangements, according to statute made and provided, must be submitted to without inquiry or interference: for, gentlemen, it is my duty to tell you that you have literally nothing to do with the laws but to obey them.' This oration, though uttered with all the becoming dignity of a senator, and although followed by an inspiring anthem from a regimental band, failed to have that weight which the venerable and too-confiding speaker anticipated. Those addressed had been for some time in

the course of etiolation, but not being much gone in the disease, they took upon them to resist the proposed arrangements as unconstitutional. A good deal of haranguing, brawling, and fighting ensued; and the end of it was, that the aforesaid notables never stopped till they had turned out of the country all the old colonels and broken-down men of fortune who had been sent to govern and etiolate them. After that, the people bought and sold as they liked, manufactured what they liked, and managed their public concerns as they liked. Thus was insolence properly punished.

Without feeling any very decided prepossession in favour of the descendants of these contumacious Americans, it is impossible not to see that their minds are anything but etiolated. Two or three of the neighbouring states, which accidentally continued as led-farms at the great upheaval, have to all appearance got far into the etiolated condition: but beyond the early stages of the disease the Americans never went; and if anything be wrong with them now, it is an over, not an under, activity of brain. I repeat they may not be a people with many qualities to be admired; but, considering what they have done in seventy years, merely from being left to the untrammelled exercise of their own faculties, they may be allowed to have some grounds for boasting. In these seventy years, they have achieved greater things than they could possibly have attained in a thousand under the deadening influences to which they were originally exposed. How fortunate for human progress, how fortunate for Great Britain, their escape from etiolation!

Was it fortunate for us? No historical event was ever more so. Nations conducted at a distance, and under delegated management, cannot, in the nature of things, fulfil the ambitious desires of their owners. Providence would seem to have set a limit to the capacity of hired service, in order to check inordinate aggrandisement. Were it otherwise, the world would long since have realised the idea of universal empire. An Alexander, a Charlemagne, or a Napoleon, would have been king of all the kingdoms of the earth. The dishonesty, however, the petty selfishnesses, and other failings of delegated servants, not to speak of the varying contingencies of human affairs, will ever prevent this catastrophe. But, independently of these preventives, there is one which in itself would keep all extravagant expectations in check; and that is, the prescriptive burden which every nation imposes on itself, by dishonestly attempting to make another nation pay it tribute, either in the form of direct money contributions, or in a forced and unnatural course of trade.

A judicious father of a family endeavours to cultivate a power of self-reliance in his children; and having done his duty in this respect, he leaves them to themselves when the proper time arrives for their setting up on their own account. After this, the relationship is one of affection only. Why should nations act differently with respect to their conquests or offshoots? The true course of policy for nations of the paternal order, should consist in getting their dependencies as quickly as possible into a condition for managing their own affairs on a principle of growing nationality and independence; while their treatment of them in other respects ought to be of that generous and confiding nature which would leave on both sides a feeling of affectionate relationship. And all this, not because it would be best on economical grounds, but because it is preferable from moral and ulterior considerations. Nations should learn that they are not, any more than individuals, ex-

empted from the obligation of acting honestly and disinterestedly; that they cannot outrage natural and fixed laws without incurring the penalties of transgression.

Again, in closing these tableaux, does that terrible spectre, IRELAND, rise to oppress the imagination. What a noble country might it not have been, if exposed to a different course of circumstances since the period when it shone a star of light in an age of mediæval darkness! But regrets are now vain. All the Archæologist can do, is to wander amidst its glorious ruins, and search for traces of a refinement which centuries ago was laid ruthlessly in the dust. And must he not, in performing this classic and mournful pilgrimage, ponder on the transgressions of his ancestors, and fear that the sins of the fathers will be visited on the children even unto the present remote and guiltless generation? If such be the doom, what an ending to an ignoble chapter of history—the most stupendous example of retributive justice which the mind of the moralist could conceive! An everlasting marriage of Intelligence to Imbecility—Truth to Falsehood—Industry to Sloth—Peace to Turbulence—Riches to Beggary—Life to Death! Let us drop the curtain, and hide the appalling spectacle. Not so, however, can we extinguish that maniac shout whose echoes linger dolefully in our ears—'Why did you take me?—why did you keep me?—why did you demoralise me, and unfit me for self-reliance? Now that my mind is gone, and I am in a state of idiocy, I shall cling—cling—cling to you for ever!'

W. C.

A STORY FOR A WINTER FIRESIDE.

BY MRS CROWE.

ONE evening on which a merry Christmas party was assembled in an hospitable country mansion in the north of England, one of the company, a young man named Charles Lisle, called the host aside, as they were standing in the drawing-room before dinner, and whispered, 'I say, Graham, I wish you'd put me into a room that has either a bolt or a key.'

'They have all keys, or should have,' returned Mr Graham.

'The key of my room is lost,' returned the other; 'I asked the housemaid. It is always the first thing I look to when I enter a strange bedchamber. I can't sleep unless the door is locked.'

'How very odd! I never locked my door in my life,' said Mr Graham. 'I say, Letitia,' continued he, addressing his wife, 'here's Charlie Lisle can't sleep unless his door's locked, and the room you've put him into has no key.'

At this announcement all the ladies looked with surprise at Charlie Lisle, and all the gentlemen laughed; and 'how odd!' and 'what a strange fancy!' was echoed among them.

'I daresay you do think it very odd, and indeed it must appear rather a lady-like particularity,' responded Lisle, who was a fine active young man, and did not look as if he were much troubled with superfluous fears; 'but a circumstance that occurred to me when I was on the continent last summer has given me a nervous horror of sleeping in a room with an unlocked door, and I have never been able to overcome it. This is perhaps owing to my having been ill at the time, and I can scarcely say I have recovered from the effects of that illness yet.'

Naturally, everybody wanted to hear what this adventure was—the programme being certainly exciting—and so one of the visitors offered to exchange rooms with Charlie Lisle, provided he would tell them his story; which accordingly, when assembled round the fire in the evening, he began in the following words:—

'You must know, then, that last year, when I was wandering over the continent, partly in search of the picturesque, and partly to remedy the effects of too much study, or rather too hasty study—for I believe a man may study as much as he pleases, if he will only take it easy, as the Irish say—I was surprised one evening by a violent storm of hail, and it became so suddenly dark, that I could scarcely see my horse's head. I had twelve miles to go to the town at which I intended to pass the night, and I knew that there was no desirable shelter nearer, unless I chose to throw myself on the hospitality of the monastery of Pierre Châtel, which lay embosomed amongst the hills a little to the east of the road I was travelling. There is something romantic and interesting in a residence at a convent, but of that I need not now say anything. After a short mental debate, I resolved to present myself at the convent gate, and ask them to give me a night's shelter. So I turned off the road, and rang the heavy bell, which was answered by a burly, rosy-checked lay brother, and he forthwith conducted me to the prior, who was called the Père Jolivet. He received me very kindly, and we chatted away for some time on politics and the affairs of the world; and when the brothers were summoned to the refectory, I begged leave to join them, and share their simple repast, instead of eating the solitary supper prepared for me. There were two tables in the hall, and I was seated next the prior, in a situation that gave me a pretty good view of the whole company, and as I cast my eyes round to take a survey of the various countenances, they were suddenly arrested by one that struck me as about the most remarkable I had ever beheld. From the height of its owner as he sat, I judged he must be a very tall man, and the high round shoulders gave an idea of great physical strength; though at the same time the whole mass seemed composed of bone, for there was very little muscle to cover it. The colour of his great coarse face was of an unnatural whiteness, and the rigid immobility of the features favoured the idea that the man was more dead than alive. There was altogether something so remarkable in his looks, that I could with difficulty turn my eyes from him. My fixed gaze, I imagine, roused some emotions within him, for he returned my scrutiny with a determined and terrific glare. If I forced myself to turn away my head for a moment, round it would come again, and there were his two great mysterious eyes upon me; and that stiff jaw slowly and mechanically moving from side to side, as he ate his supper, like something acted on by a pendulum. It was really dreadful: we seemed both bewitched to stare at each other; and I longed for the signal to rise, that I might be released from the strange fascination. This came at length; and though I had promised myself to make some inquiries of the prior concerning the owner of the eyes, yet not finding myself alone with him during the evening, I forbore, and in due time retired to my chamber, intending to proceed on my journey the following day. But when the morning came, I found myself very unwell, and the hospitable prior recommended me not to leave my bed; and finally, I was obliged to remain there not only that day, but many days—in short, it was nearly a month before I was well enough to quit the convent.'

In the meantime, however, I had learnt the story of Brother Lazarus—for so I found the object of my curiosity was called; and had thereby acquired some idea of the kind of influence he had exercised over me. The window of the little room I occupied looked into the burying-place of the monastery; and on the day I first left my bed, I perceived a monk below digging a grave. He was stooping forward with his spade in his hand, and with his back towards me; and as my room was a good way from the ground, and the brothers were all habited alike, I could not distinguish which of them it was.

'You have a death amongst you?' said I to the prior when he visited me.

"No," returned he; "we have even no serious sickness at present."

"I see one of the brothers below digging a grave," I replied.

"Oh," said he, looking out, "that is Brother Lazarus—he is digging his own grave."

"What an extraordinary fancy!" said I. "But perhaps it's a penance?"

"Not a penance imposed by me," replied the prior, "but by himself. Brother Lazarus is a very strange person. Perhaps you may have observed him in the refectory—he sat nearly opposite you at the other table?"

"Bless me! is that he? Oh yes, I observed him indeed. Who could help observing him? He has the most extraordinary countenance I ever beheld."

"Brother Lazarus is a somnambulist," returned the prior; "a natural somnambulist; and is altogether, as I said before, a very extraordinary character."

"What!" said I, my curiosity being a good deal awakened, "does he walk in his sleep? I never saw a somnambulist before, and should like to hear some particulars about him, if you have no objection to tell them me."

"They are not desirable inmates, I assure you," answered the prior. "I could tell you some very odd adventures connected with this disease of Brother Lazarus."

"I should be very much obliged if you would," said I with no little eagerness.

"Somnambulists are sometimes subject to strange hallucinations," he replied; "their dream is to them as real as our actual daily life is to us, and they not unfrequently act out the scenes of the drama with a terrible determination. I will just give you one instance of the danger that may accrue from a delusion of this nature. At the last monastery I inhabited, before I became prior of Pierre Châtel, we had a monk who was known to be a somnambulist. He was a man of a sombre character and gloomy temperament; but it was rather supposed that his melancholy proceeded from physical causes, than from any particular source of mental uneasiness. His nightly wanderings were very irregular: sometimes they were frequent, sometimes there were long intermissions. Occasionally he would leave his cell, and after being absent from it several hours, would return of his own accord, still fast asleep, and lay himself in his bed: at other times he would wander so far away, that we had to send in search of him; and sometimes he would be met by the messengers on his way back, either awake or asleep, as it might happen. This strange malady had caused us some anxiety, and we had not neglected to seek the best advice we could obtain with respect to its treatment; and at length the remedies applied seemed to have taken effect; the paroxysms became more rare, and the disease so far subsided, that it ceased to be a subject of observation amongst us. Several months had elapsed since I had heard anything of the nocturnal excursions of Brother Dominique, when one night that I had some business of importance in hand, instead of going to bed when the rest of the brotherhood retired to their cells, I seated myself at my desk, for the purpose of reading and answering certain letters concerning the affair in question. I had been some time thus occupied, and had just finished my work, and had already locked my desk preparatory to going to bed, when I heard the closing of a distant door, and immediately afterwards a foot in the long gallery that separated my room from the cells of the brotherhood. What could be the matter? Somebody must be ill, and was coming to seek assistance; and I was confirmed in this persuasion when I perceived that the foot was approaching my door, the key of which I had not turned. In a moment more it opened, and Fra Dominique entered, asleep. His eyes were wide open, but there was evidently no speculation in them; they were fixed and glassy, like the eyes of a corpse. He had nothing on but the tunic which he was in the habit of

wearing at night, and in his hand he held a large knife. At this strange apparition I stood transfixed. From the cautious manner in which he had opened the door, and the stealthy pace with which he advanced into the room, I could not doubt that he was bent upon mischief; but aware of the dangerous effects that frequently result from the too sudden awakening of a sleep-walker, I thought it better to watch in silence the acting out of this fearful drama, than venture to disturb him. With all the precautions he would have used not to arouse me had he been awake, he moved towards the bed, and in so doing he had occasion to pass quite close to where I stood, and as the light of the lamps fell upon his face, I saw that his brows were knit, and his features contracted into an expression of resolute malignity. When he reached the bed, he bent over it, felt with his hand in the place where I should have been, and then, apparently satisfied, he lifted up his arm, and struck successively three heavy blows—so heavy, that, having pierced the bedclothes, the blade of the knife entered far into the mattress, or rather into the mat that served me for one. Suddenly, however, whilst his arm was raised for another blow, he started, and turning round, hastened towards the window, which he opened, and had it been large enough, I think would have thrown himself out. But finding the aperture too small, he changed his direction. Again he passed close to me, and I felt myself shrink back as he almost touched me with his tunic. The two lamps that stood on my table made no impression on his eyes; he opened and closed the door as before; and I heard him proceed rapidly along the gallery, and retire to his own cell. It would be vain to attempt to describe the amazement with which I had witnessed this terrible scene. I had been, as it were, the spectator of my own murder, and I was overcome by the horrors of this visionary assassination. Grateful to Providence for the danger I had escaped, I yet could not brace my nerves to look at it with calmness, and I passed the remainder of the night in a state of painful agitation. On the following morning, as soon as breakfast was over, I summoned Fra Dominique to my room. As he entered, I saw his eye glance at the bed, which was now, however, covered by other linen, so that there were no traces visible of his nocturnal visit. His countenance was sad, but expressed no confusion, till I inquired what had been the subject of his dreams the preceding night. Then he started, and changed colour.

"Reverend father," said he, "why do you ask me this?"

"Never mind," said I; "I have my reasons."

"I do not like to repeat my dream," returned he; "it was too frightful; and I fear that it must have been Satan himself that inspired it."

"Nevertheless let me hear it."

"Well, reverend father, if you will have it so, what I dreamt was this—but that you may the better comprehend my dream, I must give you a short sketch of the circumstances in which it originated."

"Do so," said I; "and that we may not be interrupted, I'll lock the door." So having turned the key, and bade him seat himself on a stool opposite me, I prepared to listen to the story of his life, which was to this effect. While a child of four years of age, he awoke one morning and found that his poor mother lay a bleeding corpse by his side. She had been murdered during the night by a miscreant relative, in order to obtain some mean inheritance by her decease. The effect of the circumstance, with its painful details, had disturbed his infant faculties, which led to occasional fits, and to terrific dreams. These dreams, he added, sometimes made him feel as if he were under a stern necessity of performing the part of the murderer of his mother.

"And pray," I inquired, "do you select any particular person as your victim in those dreams?"

"Always."

"And what does this selection depend upon? Is it enmity?"

'No,' returned Dominique; 'it is a peculiar influence that I cannot explain. Perhaps,' added he, after some hesitation, 'you may have observed my eyes frequently fixed on you of late?' I remembered that I had observed this; and he then told me that whoever he looked at in that manner was the person he dreamt of."

'Such,' said Charlie Lisle, 'was the prior's account of this strange personage. I confess, when I had heard his explanation, I began to feel particularly queer, for I was already satisfied that Fra Dominique and Brother Lazarus were one and the same person; and I perceived that I was in considerable danger of being the selected victim of his next dream; and so I told Père Jolivet.'

"Never fear," said he; "we lock him up every night, and have done so ever since my adventure. Added to which, he is now very unwell; he was taken with a fit yesterday, and we have been obliged to bleed him."

"But he is digging there below," said I.

"Yes," replied the prior; "he has a notion he is going to die, and intreated permission to prepare his grave. It is, however, a mere fancy I daresay. He had the same notion during the indisposition that succeeded the dream I have just related. I forgot to tell you, however, though you seem to have penetrated the secret, that this Fra Dominique changed his name to Lazarus when he accompanied me here, which he was allowed to do at his own urgent intreaty; why, I cannot tell, but ever after that conversation, he seemed to have imbibed a strong attachment to me; perhaps because I exhibited none of the distrust or aversion towards him which some persons might have been apt to entertain under the same circumstances."

'A week after this I was informed that Brother Lazarus was dead,' continued Lisle; 'and I confess I did not much regret his decease. I thought a man subject to such dangerous dreams was better out of the world than in it; more especially as by all accounts he had no enjoyment in life. On the day I quitted the monastery, I saw from my window one of the brothers completing the already partly-made grave, and learnt that he was to be buried that evening; and as I descended the stairs, I passed some monks who were carrying his coffin to his cell. "Rest his soul!" said I, as I buckled on my spurs; and having heartily thanked the good prior for his hospitality, I mounted my horse and rode away.'

Here Charlie Lisle rang the bell and asked for a glass of water.

'Is that all?' inquired Lady Araminta.

'Not quite,' said Charlie; 'the sequel is to come. My visit to the monastery of Pierre Châtel had occurred in the month of June. During the ensuing months I travelled over a considerable part of the south of France; and at length I crossed the Pyrenees, intending to proceed as far as Madrid, and winter there. Amongst the lions I had been recommended to visit was a monastery of Franciscans in the neighbourhood of Burgos, and I turned somewhat out of my road for the purpose of inspecting some curious manuscripts which the monks were reputed to possess. It was in the month of October, and a bright moonlight night, when I rang the bell, and requested to see the Padre Pachorra, to whom I had letters of introduction. I found him a dark, grave, sombre-looking man, not very unlike my old friend Brother Lazarus; and although he received me civilly enough, there was something in his demeanour that affected my spirits. The whole air of the convent, too, was melancholy; convents, like other establishments, taking their tone very much from the character of their superiors. As the monks had already supped when I arrived, I was served with some refreshment in the parlour; and the whole internal arrangements here being exceedingly strict, I immediately afterwards retired to my chamber, firmly resolved to take my departure the next day. I am not in the habit of going to bed early, and when I do, I never can sleep. By the time my usual sleeping hour is arrived, I have generally got so restless and nervous from lying awake, that slumber is banished

altogether. Consequently, whenever I am under circumstances that oblige me to retire early to my room, I make a practice of reading till I find my eyelids heavy. But the dormitory assigned me in this Franciscan convent was so chilly, and the lamp gave so little light, that either remaining out of bed or reading in it was out of the question; so I yielded to necessity, and stretched myself on Padre Pachorra's hard couch; and a very hard one it was, I assure you. I was very cold too. There were not coverings enough on the bed to keep in my animal heat; and although I spread my own clothes over me also, still I lay shivering in a very uncomfortable manner, and, I am afraid, uttering sundry harsh remarks on the padre's niggardly hospitality. In this agreeable occupation, as you may suppose, the flight of time was somewhat of the slowest. I do not know how many hours I had been there, but I had begun to think it never would be morning, when I heard something stirring in the gallery outside my door. The silence of a convent at night is the silence of the grave. Too far removed from the busy world without for external sounds to penetrate the thick walls, whilst within no slamming door, nor wandering foot, nor sacrilegious voice breaks in upon the stillness, the slightest noise strikes upon the ear with a fearful distinctness. I had no shutters to my window, so that I was aware it was still pitch-dark without, though, within, the feeble light of my lamp still enabled me to see a little about me. I knew that the inmates of monasteries not only rise before daylight, but also that they perform midnight masses, and so forth; but then I had always observed that on these occasions they were summoned by a bell. Now, there was no bell; on the contrary, all was still as death, except the cautious foot which seemed to be approaching my room. "What on earth can it be?" thought I, sitting up in bed with an indescribable feeling of apprehension. At that moment a hand was laid upon the latch of my door. I cannot tell why, but instinctively I jumped out of bed—the door opened, and in walked what appeared to me to be Brother Lazarus, exactly as the prior of Pierre Châtel had described him to me on the occasion of his nocturnal visit to his chamber. His eyes were open, but glazed, as of one dead; his face was of a ghastly paleness; he had nothing on but the gray tunic in which he slept; and in his hand he held a knife, such a one as was used by the monks to cut their large loaves with.

'You may conceive my amazement,' continued Charlie Lisle, whilst amongst his auditors every eye was firmly riveted. 'I rubbed my eyes, and asked myself if I were dreaming. Too surely I was awake—I had never even slumbered for an instant. Was I mad? I did not think I was; but certainly that was no proof to the contrary; and I almost began to doubt that Brother Lazarus was dead and buried on the other side of the Pyrenees. The prior of Pierre Châtel had told me he was dead, and I had heard several others of the brotherhood alluding to his decease. I had seen his grave made ready, and I had passed his coffin as I descended to the hall; yet here he was in Spain, again rehearsing the frightful scene that Jolivet had described to me! Whilst all this was flitting through my mind, I was standing *en chemise* betwixt the bed and the wall, on which side I had happened to leap out. In the meantime the apparition advanced with bare feet, and with the greatest caution, towards the other side of the bed; and as there were of course no curtains, I had a full view of his diabolical features, which appeared contracted with rage and malignity. As Jolivet had described to me, he first felt the bed, as if to ascertain if I were there; and I confess I was frightened out of my senses lest he should discover that I was not, and possibly detect me where I was. What could I have done, unarmed, and in my shirt, against this preternatural-looking monster? And to wake him—provided always it was really Brother Lazarus, and not his double, a point about which I felt exceedingly uncertain—I had learnt from Jolivet was extremely perilous. How-

ever, he did not discover that the bed was empty—his dream no doubt supplying a visionary victim for the occasion—and raising his arm, he plunged the knife into the mattress with a fierce determination that convinced me I should have had very little chance of surviving the blow had I been where he imagined me. Again and again he struck, I looking on with a horror that words could but feebly paint; and then he suddenly started—the uplifted arm was arrested—the pursuer was at hand: he first rushed to the window, and opened it, but being only a small lattice, there was no egress there, so he turned to the door, making his escape that way; and I could hear his foot distinctly flying along the gallery till he reached his own cell. By this time I was perfectly satisfied that it was no spirit I had seen, but the veritable Brother Lazarus, or Dominique, or whatever his name was—for he might have half a dozen aliases for aught I knew—though how he had contrived to come to life again, if he were dead, or by what means, or for what purpose, he could have persuaded the monks of Pierre Châtel of his decease, if the fact were not so, I could not conceive. There was no fastening to my door, and the first question that occurred to me was, whether this diabolical dream of his was ever repeated twice in one night. I had often heard that the magic number of three is apt to prevail on these occasions; and if so, he might come back again. I confess I was horribly afraid that he would. In the meantime I found myself shivering with cold, and was, perforce, obliged to creep into the bed, where indeed I was not much warmer. Sleep was of course out of the question. I lay listening anxiously, expecting either the stealthy foot of Brother Lazarus, or the glad sound of the matin bell, that would summon the monks from their cells, and wondering which I should hear first. Fortunately for my nerves it was the latter; and with alacrity I jumped out of bed, dressed myself, and descended to the chapel.

When I reached it, the monks were on their knees, and their cowls being over their heads, I could not, as I ran my eye over them, distinguish my friend the somnambulist; but when they rose to their feet, his tall gaunt figure and high shoulders were easily discernible, and I had identified him before I saw his face. As they passed out of the chapel, I drew near and saluted him, observing that I believed I had had the pleasure of seeing him before at Pierre Châtel; but he only shook his head, as if in token of denial; and as I could obtain no other answer to my further attempts at conversation, I left him, and proceeded to pay my respects to the prior. Of course I felt it my duty to mention my adventure of the previous night, for Brother Lazarus might on some occasion chance to act out his dream more effectually than he had had the opportunity of doing with me and Père Jolivet.

"I am extremely sorry indeed," said Padre Pachorra when he had heard my story; "they must have omitted to lock him into his cell last night. I must speak about it, for the consequences might have been very serious."

"Very serious to me certainly," said I. "But how is it I see this man here alive? When I quitted Pierre Châtel I was told he was dead, and I saw the preparations for his burial."

"They believed him dead," returned the prior; "but he was only in a trance; and after he was screwed down in his coffin, just as they were about to lower it into the grave, they felt that something was moving within. They opened it, and Fra Dominique was found alive. It appeared, from his own account, that he had been suffering extremely from his dreadful dream, on occasion of the visit of some young stranger—an Englishman, I think."

"Myself, I have no doubt," said I.

"Probably," returned the prior; "and this was either the cause or the consequence of his illness, for it is difficult to decide which."

"But how came he here?" I inquired.

"It was in this monastery he commenced his voca-

tion," answered the padre. "He was only at Pierre Châtel by indulgence, and after this accident they did not wish to retain him."

"I do not wonder at that, I am sure," said I. "But why did he deny having been there? When I spoke of it to him just now, he only shook his head."

"He did not mean to deny it, I daresay," said the prior; "but he never speaks. Fra Dominique has taken a vow of eternal silence."

Here Charles Lisle brought his story to a conclusion. 'How extremely shocking!' exclaimed Lady Araminta; whilst the whole company agreed that he had made out an excellent excuse for wishing to sleep with his door locked, and that he had very satisfactorily entitled himself to the promised exchange.

BOOKSELLERS.

BOOKSELLERS are an ancient and venerable fraternity. They are associated so intimately with the production of literature, that they may almost be considered a sort of authors themselves. And many of them have been authors in reality, so easy is the transition from handling to making a book. Tonson, Dodsley, Richardson, Murray, and Constable, the great names of the profession, were all less or more bookseller-authors, and besides writing volumes themselves, were the cause of hundreds of volumes being written by others.

As old as literature itself, bookselling had its Augustan age from the era of Tonson to Constable, a space of about a hundred years, beginning in the early part of the eighteenth century. During that great epoch the 'trade' revelled in quartos and octavos. Hume, and all the other eminent authors, came out first in quarto—the lordly two-guinea quarto; and having satiated the more eager and deep-pursed part of the community in that agreeable form, down they reluctantly came to the octavo—the moderate middle-class-of-society twelve-shilling octavo. These, these were the days, Mr Rigmarole! Booksellers then were booksellers. To sell a dozen quartos in a forenoon was a satisfactory way of doing business. The transaction had a pleasing farewell flavour.

There is nothing certain in this unsteady world. The quarto and octavo era came to an end. It went out with George III., the last of the kings who wore powdered wigs. Then was let in a deluge of democratic shapes and prices. Duodecimo, post-octavo, eighteenmo, sixteenmo, and a hundred other vos and mos, bewildered the aged members of the profession. Books at three-and-sixpence and half-a-crown were a rank heresy. 'Literature is ruined, and we are ruined with it,' was the melancholy dirge sung by many a worthy bibliopole. Things, however, were not by any means at their worst; but fortunately all the old booksellers, who delighted in the sale of quartos, and constitutionally adhered to queues, were dead and in their graves before this revolutionary movement ensued. Easy, says the proverb, are the steps to destruction. The eighteenmo, and other transitional mos, having run their race, and half-crowns and shillings become no longer practicable, what did not 'the trade' endure when they saw an actual descent into brown money! This monstrous aggression on vested rights occurred in the reign of William IV., and was clearly one of those wicked attempts to found the monarchy which marked that unhappy period.

Eighteen hundred and thirty-two, what have you not to answer for! Books at a penny! Worse still—books at a penny-halfpenny! Odd halfpence counted! How on earth would it be possible to reckon a profit of five-and-twenty per cent. on three-halfpence? Plain figures could not do it. It would require decimal fractions; but then where was the coinage to meet such a state

of infinitesimal reckoning? The legislature ought certainly to interfere. If it did not, there was only one hope left, and that was, that every one of the brown-money intruders would very shortly be ruined!

In this manner, with blended feelings of consolation and despair, the bookselling world looked on the revolution from silver to copper which broke out in 1832. As is always the case in revolutions, the universal notion was, that things would by and by return to their wonted condition, and that all would go on comfortably as usual—meaning thereby that the cheap-sheet nonsense would soon explode, and no more about it. This expectation was not creditable to the acumen of the bibliopolic community. Instead of setting their faces so generally against the change, and prophesying all sorts of bad endings to the new régime, they should have perceived—Jacob Tonson and Doddsley would have done so—that the cheap-sheet idea was nothing more than an exponent of the age. In the progress of human affairs, a time had arrived when nobody had any guineas, half-crowns, or shillings to spend on books. There was nothing left in the pockets of the human race but a few odd pence and halfpence. But, deplorable as was such a catastrophe, it happened that there was still as much money in the world as ever. The only novelty was, the dispersion of the money through a great many pockets: there being, for example, eight men each with three-halfpence, in place of one who formerly had a shilling. The change was not confined to books. Every object which could be manufactured by the agency of wheels instead of men and women's fingers, similarly, and about the same time, came down in price with a marvellous celerity. Where is the haberdasher who cannot show a piece of beautiful lace, which, within his remembrance, was sold at half-a-crown a yard, but is now offered at the humble price of three-halfpence?

Of all mad ideas, that is the maddest which anticipates a return of old usages in trade. Yet how common to see men endowed with rationality standing coolly by, in the hope that affairs will resume their previous character, and with all their might denouncing changes of which it should have been their duty to take advantage. One of the first principles of commercial wisdom consists in a ready adaptation to what is evidently about to become a new fashion of taste. To stand aloof and jeer is a piece of short-sighted folly, which carries with it its own punishment; because others less scrupulous minister to the popular fancy, and speedily leave their brethren nothing to laugh at but their own incredulity. Booksellers, we fear, were too long sceptical as to the permanency or propriety of the cheaper class of publications. Many, resisting them as long as possible, have even at the last given but a faint and ungracious adherence to that great modern principle of trade—small profits on numerous transactions, instead of large profits on few transactions. On the whole, however, considerable allowances for an entirely altered state of things require to be made. Booksellers with neat counters and prim shelves could not, with complacency, see the disorderly intrusion of bales of loose sheets, which threatened a demand for new accommodation, new book-keeping, and an addition of sundry new hands. The truth is, the poor 'trade' were taken a good deal by surprise, and out of that state they have not all as yet been able to come.

So much may be granted by way of palliation; but unfortunately no degree of allowance can exactly mend the matter. To our mind the fact is as clear as the sun at noonday, that the existing bookselling apparatus has failed as an engine for the distribution of cheap literary sheets. To do justice to the recent innovations, an entirely new system of trade, supplementary to the other, would be desirable, in order to bring the distributive into harmony with the productive. Here is the way the thing stands. Twenty years ago, books were generally printed in small editions of seven hundred and fifty or one thousand copies; and for the distribution of these limited quantities the bookselling

trade was strictly and well adapted. A new order of affairs ensues. Sheets, each a book of its kind, are printed by machinery to the extent of hundreds of thousands of copies. The number of sheets which our own machines alone turn out annually is ten millions; and this is but a fragment of the new kind of trade in literature. It may seem that, if we can manage to distribute ten millions of sheets through the ordinary channels of trade, there is nothing to complain of. This is reasoning which would do for the eighteenth, not for the nineteenth century. Let us grapple with particulars. Of each number of our Journal, about eighty thousand copies have for years been distributed. Fifty thousand of these are issued in monthly parts, and such are, to all intents and purposes, monthly magazines, purchased by the higher-class families. Thirty thousand are disposed of in single sheets, the way we really wish the work to be sold. Now, what are these thirty thousand cheap sheets among twenty-eight millions of people? Say that, with our Miscellany of Tracts, and other things, we dispose of two hundred thousand sheets per week, what is even that amount to the reading population of the British islands and colonies? Our object all along has been to reach the masses, but we cannot get to them. In vain, as we said in a late article, do we cheapen literature to the verge of non-productiveness; the persons for whom we write and incur hazards are not those, generally speaking, who become our purchasers. Our sheets are addressed to the cottage fire-side; they find their way to drawing-rooms. Mr Knight—of whom the 'trade' have no little reason to be proud—makes, we believe, a similar remark. There is, he observes, a universal tendency for sheets to run into the book form; the proper interpretation of which seems to be, that the engine for sheet distribution is imperfect, and that booksellers generally encourage the monthly part or book form, as every way less troublesome.

The great question, however, remains—Do the masses, that is, the bulk of the manual labouring classes in town and country, really wish to buy literary sheets? Is it not all a delusion and fallacy for publishers like ourselves to imagine that these classes have a taste for reading, or that it is possible to create such a taste in them? After making every proper allowance for the unsuitableness of existing literary sheets, our own included, to the tastes of the working-classes, we are inclined to think that a large proportion of them would become purchasers if the article were brought distinctly within their reach. At present, few of them enter booksellers' shops; and unless a person frequent these establishments, he cannot, according to old-established usage, become a buyer of books. The only sure way to reach the masses is to act aggressively—take the booksellers' shop to their doors and firesides, and let them see and handle what is going on in the department of literature specially addressed to them. But who could undertake to send salaried agents to the doors of all the working-people of Great Britain, in the hope of selling them halfpenny tracts? There appears to us to be only two means by which the thing could be feebly attempted. One would consist in country booksellers greatly altering the style of their operations. Instead of laying a parcel of new tracts or cheap popular books on their counters, and there letting them take their chance, they might either proceed themselves, or send persons in their employment, to call on all parties around likely to become purchasers. If well-worked, such a system would carry literature into every neighbourhood, and probably extend the sale of cheap and useful books immensely; and it would have the advantage of being carried out at scarcely any expense.

Should provincial booksellers find it inconvenient or impracticable to institute any such process, then another distributive engine might be attempted. Small shopkeepers in the country, or in densely-peopled neighbourhoods, might safely and profitably adventure in the trade of selling cheap and popular tracts; and so

might individuals out of employment take up the business of hawking articles of this kind. A number of instances have come to our knowledge of parties, formerly in wretchedness, making a good livelihood by this easily-conducted trade, while at the same time they greatly extended the taste for popular literature. In a large town, where the sale of our Journal could not by the usual means be raised above fifty copies, an enterprising individual, stepping beyond the bounds of the 'trade,' elevated it with ease to twelve hundred copies. In another, but much larger town, the sales of our publications generally have been latterly doubled, merely by a bookseller in the place having incited a few men in poor circumstances to become peripatetic dealers. There is not one of these men, he tells us, who sells fewer than forty volumes daily of our *Miscellany of Useful and Entertaining Tracts* immediately after their publication; and all this over and above what the regular trade were in the habit of distributing. These, and other circumstances, convince us that the process of distributing literature has fallen considerably behind the age, and admits of prodigious extension through the agency of a new class of tradesmen acting aggressively on the masses.

Whether these rambling observations may have the effect of calling into existence such an agency as we speak of, is of course to be determined by time alone; but we mention a fact, by way of showing that our ideas on the subject are not altogether visionary. One day, about nine or ten years ago, a young man from the country waited upon us to crave our assistance. He was not begging. He told us that he had been a hand-loom weaver; that his trade was gone; that he could no longer subsist by it; and that he was determined to try something else. He said he had always had a taste for reading, and he fancied that he could make a livelihood by going about the country selling books and tracts. The only difficulty was this—he had no capital to begin with. Would we give him credit? All he wished was a small stock of our publications, to the value of £2; and to show that we might rely on his integrity, he produced a certificate of character from the minister of a congregation to which he had been some years attached. This little bit of paper was all the young man had to depend on. His fate trembled on our decision. Starvation in one scale of the balance, a comfortable independence in the other. The latter went down with a bang. We gave him the credit he required. He sold the books in a few days, and came to pay some of his debt, and get more books. In a few days, again, he sold these, paid up a little more of his debt, and again had a fresh supply. Thus he went on, always getting the more cheerful and enterprising; extending his business round the country, and realising a comfortable livelihood. Where and what is he doing now? That once abject hand-loom weaver is at this moment a respectable bookseller in a country town, with a number of persons in his employment. From first to last he has dispersed a large quantity of our sheets and books; and of other publications his sales have doubtless been far more considerable.

The success of this person, whom we may call hand-loom weaver No. 1, incited another individual, whom we may call hand-loom weaver No. 2, to try the same sort of trade. We likewise granted him credit on the like terms; and he also, we are glad to say, turned out well, and is now in respectable circumstances. Hearing of all this, hand-loom weaver No. 3 made his appearance; and he, after a little inquiry, was placed on the same footing with his predecessors. No. 3, however, was a failure. Having got the two pounds' worth of credit, we never saw him more. The cash he got into his hands proved too heavy a temptation. There were, in his opinion, a great many good drams and bottles of porter in two pounds. And to indulge his appetite in these, he sacrificed a lifetime of respectability and comfort. At this moment he is precisely in the position from which he made the too ambitious effort some years

ago to raise himself. In these anecdotes do we not see a miniature of the social world?—the true and honest man getting forward in his arduous enterprises; the false, the self-indulgent, the indolent, lost in the great gulf of human wretchedness.

JACQUES LAFITTE.

'If men make their boast of the honourable name, the rank in life, which they inherit from their fathers, why should it not be a much nobler boast to owe only to myself, to my own talent, my genius, my industry, name, and fortune, and position in society—to make them all, in short, for myself?'

Such were the reflections of a youth who, one morning in the year 1787, was hurrying, in much apparent agitation, along the street of the *Chaussee d'Antin*, and who now stopped, as if undecided what to do, before one of the handsomest hotels in Paris, which had been long the abode of a great banker.

No sooner had he passed through the gate, than a very natural feeling of timidity made the youth draw back a few steps, while his mild and pleasing countenance seemed to assume a still more pensive expression as his eye for a moment fell upon his plain coarse garb. The courage which had led him on so far had suddenly abandoned him, and he would have gone away as he came, if the concierge, or house-porter, who had been for some moments watching and smiling at his embarrassment, had not advanced towards him and inquired what he wanted.

'I wish to see Monsieur Perregaux,' replied he, encouraged by something in the look of the man.

'You can walk up stairs,' answered the porter, pointing to a wide handsome staircase, which our young hero ascended as if every step was made of fire, so much did he dread cutting with his hob-nailed and dusty shoes the soft rich carpets which covered it.

In the anteroom he found a great many people, and stood modestly in a corner, while the big tears were trembling in his eyes as he thought of his native town, of the paternal roof, of the companions of his childhood, and of the last adieu of his mother—her anguish, her fears, her admonitions.

'You have here a humble home, but still a home,' said she weeping; 'what do you expect to do at Paris?'

'I want to make my fortune,' replied the young man, 'and then to share it with you, and my father, and my brothers.'

'Fortune does not always come to him who seeks,' said the anxious mother.

'But it never comes to those who do not seek,' replied the young enthusiast.

'Well,' said the fond mother, 'go, if it must be so; but should you not succeed, do not be ashamed to return to us. The house of your father, and the arms of your mother, will be ever open to you, and, like the prodigal, you shall have the fatted calf killed for you.'

He had laughed in his youthful ardour at the puerile fears of his mother. 'Not succeed!' said he to himself; 'impossible!' Nor was his faith shaken in the morning on which he left his home; for that morning was a lovely one in April, and how could he distrust the gracious providence of God, whilst the very air he breathed seemed redolent with his goodness? But as he drew near the end of his journey, the goal of his hopes, he began to feel some misgivings; and by degrees they took such possession of his mind, and of every faculty, that at the moment it came to his turn to have an audience of the banker, he would gladly have been anywhere else.

Monsieur Perregaux was standing in the window: he was reading a letter, and hardly raised his eyes as the youth entered, as if awaiting his speaking; but hearing nothing but a hurried breathing, he at length looked up, and perceived a very pleasing countenance, and lips parted as if to address him, but no sound was audible.

'You wished to see me, sir?' said the banker so courteously, that the youth recovered his voice and courage sufficiently to reply.

'Sir,' said he, 'I have neither name, nor fortune, nor station, but I have the will and the power to labour. Can you give me a place in your office? The lowest would satisfy me.'

'What is your name, young man?' asked M. Perregeux, unable to take his eyes off his interesting countenance, and reading talent in the bright eye that, in renewed hope, now fearlessly met his.

'Jacques Lafitte,' was the answer.

'Your age?'

'I am twenty; I was born in 1767,' answered he.

'Are you a Parisian?' was the banker's next question.

'No, sir; I am from Bayonna,' answered Jacques.

'What is your father?' rejoined the banker.

'He is a carpenter,' replied the youth; 'but he has ten children,' he hastily added, 'and I am come to Paris to try to help my father to support them.'

'It is a laudable design, young man,' answered the banker, 'but I have no place vacant.' Then added, as he saw the utter disappointment that marked that expressive countenance, 'at present at least. I am sorry that it is so, but another time, perhaps.' Then dismissing the youth with a courteous but imperative gesture, he was obliged to retire.

Everything seemed to swim before his eyes. He knocked up against the door, which he forgot to open; his foot slipped in the anteroom; and he nearly fell down the staircase. All the courage he had exerted—and more is necessary than may be at first imagined in addressing a great man and asking a favour of him—all this courage had failed as he heard the words of the rejection. He felt a kind of shame, nay, almost of remorse, at having exposed himself to a refusal; and the last words of the banker, and the last words of his mother, seemed ringing in his ears.

Slowly and with downcast eyes he was crossing the banker's courtyard, when a pin on the ground caught his attention. He stooped, picked it up, and stuck it carefully in the lining of the cuff of his coat. This action, trifling as it was, decided the fortunes of the carpenter's son.

M. Perregeux was still standing in the window, unable to shake off the painful impression left by the look of almost agonised disappointment which his refusal had called up to the interesting countenance of the young petitioner. Involuntarily he gazed after him till he left the room, and still followed him with his eyes as he crossed the court with slow and languid step, his youthful figure drooping under disappointment, and deep dejection marking every feature. Suddenly he saw him stoop to some object too minute for him to distinguish from the window, and pick it up. By the use he made of it, the banker guessed what it must be; and the strong impression made by this little incident upon his mind, is perhaps inconceivable by those who know not how accurately character may be estimated by trifles. It was sufficient to enable M. Perregeux to discern in the youthful suitor he had rejected a mind trained to order and economy. 'The man,' he said, 'who would not let even a pin be lost, must have habits of calculation, order, and steadiness;' and opening the window, he gave a slight cough. Jacques looked up, and saw the banker beckoning to him to come back. Quickly was he again on the handsome staircase; but we will not say that this time he was quite as cautious of spoiling the carpets; and once more he stood, with head erect, in the presence of the banker.

'You will grant my request?' said he to him in a tone of happy confidence.

'What makes you so sure?' asked the banker with a smile.

'Why otherwise would you have called me back?' said Lafitte.

'Quick intellect, order, and economy!—you ought to make a good clerk,' was the cordial response of M. Per-

regeux. 'Go to the bank; I shall be there immediately, and will set you to work.'

Such a mind as that of Jacques Lafitte could not long remain in a subordinate capacity. The Revolution broke out. At the time of the Assembly of Notables he was book-keeper; then cash-keeper; and in 1804, partner to M. Perregeux; and soon after, his successor and executor. In 1809 he was appointed director, and in 1814 president of the Bank of France, having been previously made president of the Chamber of Commerce, and judge of the Tribunal of Commerce for the Seine department, which in 1816 he was chosen to represent in the Chamber of Deputies. After the Revolution of July 1830, he filled some of the highest offices of the state. His whole career was honourable to himself and beneficial to others. Honourable to himself, for he was indebted, under Providential blessing, to his own talent and irreproachable conduct for his brilliant success; and useful to others, for he never lost an opportunity of doing good. His benefits are still fresh in the memory—the heart-memory—of many. A child of the people himself, he never forgot the first day he stood a suppliant in the anteroom of M. Perregeux; and never did heavy heart, that he could relieve of its burden, return unsolaced.

He died on the 26th of March 1844. Some short time before, he had sent for his grandchildren, the children of his only daughter, the Princess de la Moskowa; and having embraced them, and taken a tender leave of his wife, and daughter, and son-in-law, he gently expired without a struggle or any apparent suffering.

NATURE AT WAR.

THIRD ARTICLE.

I HAVE described the wise and complicated provisions against danger from without with which the system of created beings has been endowed; but it must be observed that a great portion of the weapons thus catalogued as mere defensive instruments, become, with equal facility, powerful organs of offence; and according to the circumstances, habits, or emergencies, may be used at all times in subservience to either end. It is my business now to direct attention more particularly to the aggressions of the animal kingdom—to that which, in a few words, may be designated as the system of prey. Before, it was the implements of conflict and protection; now, it is the warfare itself which is to be discussed. That the face of nature should be found, on a due examination, to be stained with blood and deformed with civil war; that it should be an ordinance of creation that the life of one should depend upon the death of another creature; that this green world should be the great theatre in which myriads of bloody dramas are daily enacted—all this, as has been remarked formerly, is sufficiently startling to him who holds narrow views of the system which governs our world. Yet I must be content to leave its defence for a future occasion, while it is my endeavour at present to trace still further the wisdom and design of the Creator of all things in the development of the second feature of our interesting subject. In considering it attentively, it will be found to resolve itself into two great divisions, to which almost all examples are reducible; these are *stratagetic and open warfare*.

I shall commence with *stratagems*. Of all predatory devices, that which involves the greatest apparent amount of superior sagacity is the *trap or snare*. It is a curious subject for reflection to find one creature thus employing its apparently superior intelligence to effect the destruction of some less gifted or differently gifted one; but the fact that, in preparing these devices, the creature is only acting in obedience to an impulse with which it has been endowed, and is consequently displaying no really higher amount of sagacity than that of the bird in preparing its nest, the rabbit its burrow,

the bee its cell, divests it of that undue claim upon our surprise with which the enthusiastic among the lovers of natural history would endow it. Traps and gins are not, however, by any means common artifices; but the interest which naturally attaches to such instances, wherever they exist, outbalances their deficiency in numerical variety. In the formation of these traps, the most wonderful evidences of engineering and mathematical capabilities are to be found united to a heroic patience under difficulties, and perseverance against obstacles, which might well read a moral lesson to mankind. The pitfall is a stratagem of this nature. The larva of a particular species of beetle, the *cicindela*, hollows out for itself a den which in some measure acts as a trap for all unwary insects that draw near it. The insect, after choosing an appropriate soil, immediately applies itself to its work, and commences operations by scooping out the earth with its jaws and feet. These labours it continues until it has formed a cylindrical cavity twelve or eighteen inches deep, the bore of which is perpendicular. The laborious little workman, in making this excavation, is obliged to bring up load after load of earth, like a bricklayer his mortar, upon its head from the very bottom of the pit. When the depth of the pit is remembered, a proper value will be set upon the arduous nature of this travail: the poor insect, in fact, is frequently so exhausted, as to be compelled to rest upon its way up to recover strength to proceed; an event which has been foreseen, and to provide for which it has an apparatus somewhat like an anchor, by which it can hold on to the sides of the cavity. The *cicindela* then secures itself to the inside of the hole, near its entrance, its head exactly fitting the aperture, and forming a kind of trap-door to it. Here the insect, in philosophic patience, and with its terrible jaws widely expanded, awaits the arrival of its prey. A vagrant beetle, or a stray caterpillar, or a heedless ant, comes by and by, steps upon the insect's head, and is instantly seized by it, and hurled to the bottom of its gloomy den, whither the successful stratagist instantly follows, to reap the reward of its ingenuity and the fruits of its patient labour.

There is a more famous pit-digger, however, to be found in the ant-lion, the *Myrmelion formicarius*; and here we shall find a far more refined subtlety at work. When it is in the larva state, it excavates a funnel-shaped pit in the following manner. It seems to spend much care and thought in the selection of a proper spot, where the earth is dry, friable, and particularly where it is sandy; and this accomplished, it begins by describing a circle on the ground, the circumference of which is to be the limit of its trap. It then stations itself inside this line, and, with all the method of a human excavator, begins its work. It uses one of its fore-legs as the spade, and shovels up by this means a tiny load of earth upon its head, tossing it thence to a distance of several inches from the outer margin of the trap. Working assiduously in this apparently awkward fashion, it proceeds *backwards*; and when it has completed the circle, it turns round, and beginning another inside the last, it works on until it comes to the same spot again; and so on alternately. By this simple means it never overworks either of its legs. It steadily proceeds in its labour, until at length a conical hole, varying from one to three inches in diameter, is formed. The labourer then buries his body at the bottom of the trap, being careful to leave only his jaws above the surface, and thus he lies waiting for the first windfall. The reader will find, in writings upon entomology, most captivating accounts of this creature's wonderful patience and adaptive skill, to which it is sufficient for me to refer him if he seeks to know more concerning it. When an insect approaches the margin of the den, a little shower of sand rolls down, and calls the ant-lion to the *qui rous*; a step farther, and the intruder tumbles over the edge, and tumbles down, in a cloud of dust, into the embrace of its ruthless enemy. It is then instantly seized in the powerful jaws of the ant-lion; its juices

are sucked out; and when sated with the draught, the artful epicure places the dead dry carcase carefully on its head, and carts it out of the pit. Sometimes the victim makes a struggle for its life, and scrambles with the speed of terror up the treacherous sides of the den; but in this case the ant-lion sends after it such volleys of sand, as usually bring the fugitive down again into its enemy's power.

These devices for entrapping prey are practised by insects generally possessed of very feeble locomotive powers, and appear otherwise incapable of obtaining a single mouthful of food. The ant-lion, for instance, cannot pursue its fleet-legged prey, and is, in truth, altogether unable to move in any but a retrograde direction; but ample compensation is to be found in the success of his stratagem, which is in general so great, as to supply a very dainty creature with an abundance of that refined sort of sustenance in which it delights. The margins of these traps, all bestrewn as they are with the mangled carcases of the victims of this destroyer, remind one of the old fables of the giants who feasted upon human victims, and covered the plain in the vicinity of their dens with the bones and mangled remains of their unfortunate prey.

Next in order in this stratagetic warfare, we meet with the system of gins. But both it and the preceding are artifices almost confined to insect warfare. The spider's web may be taken as the type of such plans in general. In its structure, in its adaptation to situation and circumstances, and in its different degrees of strength, are to be found the sole varieties which we are to expect in this department. The nets are of many different kinds. Some, from the geometric accuracy of their lines, have received a correspondent title; some are woven with apparently no such rigid arrangement, but consist simply of threads intricately interlaced, forming a cloud-like fabric which no human art can imitate; some are suspended perpendicularly, their ends tied to the sprigs and leaves around; while others are laid horizontally, swinging like a hammock from a stalwart series of supporting blades of grass. There is a kind of spider, common enough in Britain, which, after carefully constructing its net, forms a delicate cell for its own concealment somewhere in the immediate neighbourhood, at the bottom of which it crouches down in expectation of its prey. Others cast forth and fasten down blue and delicate tacklings in an indiscriminate manner, trusting to chance to direct some insect against them. The lines of several kinds are covered with amazingly minute floccules of silk, which wrap round and firmly entangle any insect which casts itself against them. Among other varieties of spider network, is one which consists in a delicate purse-like cell forming the centre, from the margin of which several lines radiate in every direction. The spider places itself in this cell, taking hold of these lines; and as soon as an insect touches any portion of her tackling, rushes out from her concealment to the attack. Many of my readers must have seen, stretched upon the hedgerow, all glistening with drops of dew, a delicate whitish-looking net; this is the work of a spider which is concealed at the bottom of a silken-covered way near its margin, where it 'bides its time.' Add to these the performances of the aeronautic spiders, about which so much has been, and remains to be, written, and the list of web-like devices may be called complete.

To turn to the artifice of baits. This is altogether confined to the higher orders of creatures, and is a rarity even among them. It is well known that monkeys, and it is related that the racoon, when driven by want of other food to prey upon crabs, insert their tails into the holes where the crab lives secure; upon which the victim fastens upon the bait with its claws, and the monkey immediately runs away, dragging the crab out of its cell up the beach, when the ravisher breaks the shell and devours its contents. The ant-eater affords a remarkable illustration also of a similar ingenuity. This creature, on discovering an ant-hill,

stamps and scratches upon it with its feet, and makes such a noise, as to draw forth thousands of its angry tenants. It is then said to conceal itself in the herbage, and to thrust out its tongue, which is slimy, red, and about two feet long, into the midst of the swarm. The insects perceiving such a tempting morsel of red flesh within reach, crowd upon it, and cover it all over: and there they are held by the glairy viscosity of the tongue. and are drawn into the ant-eater's mouth and devoured. It is said that if the ants will not come out readily, the ant-eater will knock down their houses, and thrust his tongue into the thickest of the infuriated insects, being able to bid defiance to their attacks by reason of his impenetrable hide. Desmarest asserts that the *gulo*, or glutton, will mount up trees, gather the lichen from them, and fling it down as a bait for the reindeer, upon whose neck it drops if the bait is successful. This is not credited, however, by other naturalists. Pliny says that the *Lophius piscatorius*, or sea-devil, buries itself in the mud, and leaves only its long beards to be seen above the surface: the smaller fish seize upon these as bait, and are immediately drawn into the angler's mouth. It is only fair to add that this still rests upon his authority alone.

Ambuscades are a far more common means of capture among all classes of the animal kingdom. Evelyn in his travels in Italy gives a most amusing account of the manoeuvres of a spider which he denominates a *hunter*, and stigmatises with being a kind of insect-wolf. This creature, it seems (which is also common in our gardens), on perceiving a fly at a little distance, would cautiously creep up to it, and after peeping over and carefully ascertaining the insect's position, would leap upon him like lightning, catch him in the fall, and never quit her hold until her belly was full. Lying in ambush is the customary resort of many carnivorous animals; thus the lion, tiger, panther, lynx, and many more of the feline tribe, bury themselves in the recesses of the bush or brake, or with a subtler cunning seek out some hiding-place near the water-track of deer or cattle, and bound upon their quarry with a terrific war-whoop. Some of them climb up trees, and patiently rest upon their branches until the prey passes beneath, when they shoot down upon its back. The *ichneumon*, in embellishing whose natural history inventive talent has exhausted itself, is related to feign himself dead until his victim is within reach, when he pounces upon and destroys it. The wretched Egyptians adored this brute as a deity, from the service it rendered them in the destruction of the eggs of the crocodile. It used to be said that the *ichneumon* darted down the crocodile's throat, and destroyed it by devouring its entrails, and then ate its way out again! The chetah and ounce, which are used in hunting the antelope, are the exact parallels of the venatorial spider. These creatures, when they perceive their prey in view, creep stealthily along the ground, concealing themselves carefully from sight, and when they have reached within leap of the herd, they make several immense bounds, and dart in upon them.

This is a sketch of the *types* of the stratagetic warfare carried on in all portions of the kingdom of nature. A scene of blood and rapacity opens upon us when we turn to the other division of our subject—*open war*. Among all classes, to speak generally of the animal kingdom, there exists this division—carnivorous and herbivorous animals; some being partakers of both peculiarities, and therefore called omnivorous. One of these great classes subsists by making war upon its own department in creation; the other by preying upon the vegetable productions of the earth: and so intimate is the connexion between bloodshed and ferocity, that, as a common rule, the creatures belonging to the first class are conspicuous for their savage, unappeasable, untameable dispositions, while the latter are peaceful, and, excepting in the event of an attack, commonly inoffensive animals. Thus it is with the predaceous of the carnivorous kind that our present

business lies. Giving once more a brief precedence to insects, we find scorpions and others furious cannibals, and after a general combat, setting to and devouring the dead bodies of their slain. There is a sand-wasp or *sphex*, which is a fierce creature too; he will pounce upon larvae, large spiders, and other insects, and even cockroaches, plunging his sting into their bodies, and then at leisure consuming them. Some flies will also thrust their prey, small aphides, through with their weapons, and devour them in astonishing numbers. Kirby gives a very pretty account of the destruction wrought by our familiar little friend the lady-bird, which, he says, does incredible service to the hop-growers by consuming tens of thousands of the hop-fly. When the cicindela is in its perfect state, it is also a fearful destroyer of the insect race. Linnæus has called it the insect tiger. It has formidable jaws and fangs, and from its strength, vigilance, and velocity, is the terror of the insect world. The dragon-fly, or *libellula*, is equally terrible, both in its larva and pupa states. An anecdote is related of a combat between the pupa of a dragon-fly and a stickleback, in which the former with its jaws and forceps attacked the stickleback, and after an obstinate and bloody contest, at length obtained the victory. Wasps, ants, hornets, earwigs, water scorpions, and many others, labour under the same stigma. Some of them seem almost to murder for murder's sake, and will destroy a number of insects without an attempt to devour them. In fact these insects scarcely seem to know what the sentiment of fear is, and with surprising courage will attack and overcome enemies much their superiors in size.

The carnivorous birds likewise wage a deadly warfare upon their own race, and upon the weaker animals. They are generally solitary creatures. To use Goldsmith's words—'They prowl alone, and, like robbers, enjoy in solitude the fruits of their plunder. They spread terror wherever they approach: all that variety of music which but a moment before enlivened the grove, at their appearing is instantly at an end: every order of lesser birds seek for safety either by concealment or flight, and some are even driven to take protection with man, to avoid their less merciful pursuers.' The eagle, in the stern majesty of superior strength and fierceness, is the head of rapacious birds. In his wake follows the audacious and cunning osprey, which is guilty of both robbery and murder, darting upon diving birds, and snatching their prey from their beaks. The *piggargus* and the bal-buzzard are also constantly engaged in mutual warfare. The condor, by its size, weapons, and evil habits, ranks even higher for his deeds of blood. Humboldt asserts that this bird and its mate will attack a deer, wounding it with their beaks and talons until it drops with exhaustion, and is soon destroyed and devoured. He adds, that the mischief done to cattle and sheep in its vicinity is immense. The vulture, though entertaining a preference for the *haut gout* of corruption, will nevertheless pounce upon so large a creature as a heifer, if it lies down upon the ground, and succeed in destroying it. And last, not least ferocious, is the valiant shriek or butcher-bird, which seems possessed with a spirit of the intensest hatred to all the feathered race. Its name is derived from the circumstance that they are said, when they have killed their prey, to spit it, as human butchers their meat, upon some thorn, until they are at leisure to devour it. In mentioning further the names of the falcon, hawk, buzzard, and kite, and in barely alluding to the birds which go forth to prey at night, the subject will have received a sufficient illustration.

The ocean is the vast arena in which the practice of mutual destruction reaches its climax; for this reason, that fish, as a general rule, exist by devouring their smaller, weaker brethren, or are insectivorous creatures: so that, before the pike or the salmon can make a single meal, they must have imbrued themselves in the blood of some of the animated beings which crowd the waters or float in the air. The crustaceans—the crab

and lobster—particularly distinguish themselves in this conflict. With a courage inspired no doubt by conscious impregnability, some of them will go thrashing up the mud along shore, and recklessly seizing upon and devouring whatsoever comes within grasp of their Herculean forceps. But when their moult comes on, when they have lost their stout defences, they are placed in a pitifully helpless condition, and in this state suffer the full vengeance of retribution, falling victims in myriads to the thousand chances and enemies of the sea. There is a species of *trochus*, or sea-snail, which is even more formidable than the crustaceans. This creature is a universal belligerent, and while dreaded himself, seems to dread no foe. He has a kind of borer, with which he will attack the thickest shell; and, like the gulo, assiduously stick to it until he has penetrated it, and destroyed its unfortunate occupant. The doredo, the mortal enemy of the persecuted flying-fish, is a very ravenous creature; and the shark, sword-fish, and dog-fish, whose ravages among the tenants of the waters are famous, have become familiar synonyms for rapacity and cruelty; while the great whale destroys at a gulp millions of the *clio borealis*. Among reptiles, the blood-thirsty crocodile occupies a prominent position: he is the enemy of man and beast; and whatsoever creature ventures down to his abode, he attacks with equal fearlessness and ferocity. Terrible battles between tigers and crocodiles are on record, in which, while in his own element, the latter has generally been victor.

Here I will take my leave of these deeds of animal rapacity. If the illustrations to which I have confined myself appear to the lover of natural history, as indeed they are, cramped and incomplete, it results not from the deficiency, but from the very superabundance of the material—the difficulty having been a sufficiently rigid selection and condensation.

VISIT TO RAGGED SCHOOLS IN LIVERPOOL.*

THE establishment of what were called 'Ragged Schools' in London, lately induced several benevolent and influential gentlemen of Liverpool to organise a few schools of the same kind in that town. Subscriptions were accordingly made, a managing committee appointed, rooms hired, and salaried professional teachers elected. The town of Liverpool contains large numbers of children who never attend day-schools, and who grow up with little or no school instruction. The field for such Ragged Schools is therefore very extensive. It was resolved by the committee that all children, from the ages of six to seventeen, should be allowed to attend the schools without any charge whatsoever. All who presented themselves were to be received; but to prevent overcrowding, as well as to restrict the schools to that class for which they were more particularly intended, none were taken who were actually in attendance at a day-school, unless there was sufficient room in the Ragged School for them. Operations were commenced in July 1846. The schools for boys meet every evening (excepting Saturday and Sunday), from seven to nine o'clock; and for girls on the same evenings, from half-past six to half-past eight o'clock. There are now in operation two schools for boys, containing one hundred and thirty, and two for girls, containing one hundred and forty pupils. A few notes of visits lately paid to these schools may perhaps be of interest to the readers of this Journal. It must be premised, that as yet the schools can only be considered in their infancy, and have been planted only in one quarter of the town. Their extension will of course depend upon the success of the plan, and the liberality of the public.

It was not an easy matter to reach the first school to which I was directed. At length I discovered it at the end of one of the streets leading to the docks, and in the midst of a locality suitable for its humane operations.

A low building, without windows to the street, through the door of which gleamed bright light, was the school. The interior was rude and rough, and the walls were little more than a shelter from the weather. The floor was flagged, the bare brick walls whitewashed, and there was no ceiling, the room being lighted during the day by skylights in the roof. A few seats and desks ranged in the room accommodated the pupils, about seventy-five in number; a small stage was erected for the teacher; and at one end of it an extempore form had been made by placing a rough board, with its end resting on empty barrels, on which several boys were seated, practising writing on slates. There was neither fireplace nor stove in the room, but it was well lighted by gas, the heat of which, combined with the respiration of the pupils, rendered the air most unhealthy.

It was indeed a 'Ragged School.' Cold as the night was, many of the boys wore neither shoes nor stockings. The clothes of many were in tatters, and had evidently had several owners before coming into the possession of their present wearers. A few were in fustian dresses that had long ago lost their whiteness in the workshop. The faces of several were very dirty, and their hair hung in tangled masses about their ears; but out of the dirt and disorder gleamed bright piercing eyes, whose lustre nothing appeared to dim. Many had evidently come to school with 'new-washed' evening 'face,' but not one came 'creeping like snail,' or unwillingly. The boys were of all ages, from six to seventeen, and were all busy and cheerful. There was only one exception. This was a strong wild lad, of about fifteen, who was resting his head on one of the benches, apparently asleep. He was dressed in a wide jacket of rough blue flannel, his hands and face were unwashed, and a phrenologist would have found in his head a remarkable development of Combativeness and Destructiveness. This lad wrought in a foundry, and the teacher described him as the most troublesome pupil—a self-willed, mischievous boy, whom it was a relief to see doing *nothing*. Still, this lad had received a little smattering of knowledge. He was in course of being 'broken in,' and might (such things have been) become a rough energetic engineer on some line of railway not yet 'provisionally registered.' However, here he was reposing on the desk, under the master's platform, while an advanced class of about eight or ten boys, collected around him, were reading from Chambers's 'Simple Lessons.' The lesson was a short account of the life of Mungo Park, and was read in a very passable manner. The answers to the questions put to the boys showed how attentive they had been to the sense as well as the words. The lesson being finished, the master was about to collect the books, when he was called away, as he often necessarily was, to another part of the room. It was interesting to observe that the boys, instead of closing the books, laying them aside, and then teasing each other, as some would have expected, still continued to read, but not aloud; and when the master came back, the books were given up with the greatest reluctance, each boy retaining his as long as he possibly could. The books seemed to have opened up a new world, and appeared to convey a pleasure as intense as it was rare. One boy in this class, who was very intent on his book, was as 'dusty as a miller,' and I found that he was a baker's boy, whose daily employment for some years had been to go out with bread, and do other drudgery in a baker's shop. Here was another attentive lad, with blackened face and horny hands, who had been attentively listening to the story of Mungo Park, and who told the teacher, as he left school, that he could not attend during the following week, as he wrought in a foundry, and was then required to take his turn, with many others, at night-work. The teacher said that he had many such pupils.

On one of the platform seats were about a dozen young boys learning to write on slates placed on their knees. Some could write their own names, but the

* This article has been forwarded to us by a gentleman resident in Liverpool.—Ed. C. E. J.

majority were learning to form single letters. One little boy, about eleven years of age, was labouring anxiously to form the vowels on his slate. He was without stockings or shoes; his little clothes were ragged and worn, but there was an evident attempt to make them look as clean as could be. He said he had never attended a day-school in his life; that his mother was a widow, probably living in one of the Liverpool cellars; that she kept a mangle; and that he, poor little fellow, was required all day long, when he should have been at school, to attend and turn it. There he sat, his whole soul absorbed in the attempt to form the letters *a, e, i, o, u*. Beside him was a little rogue, younger even than himself, who had the good fortune to be attending a free day-school in connexion with a church, and who looked down on his less-favoured comrade as a peer would regard a commoner. Here, again, was another lad, about the same age, employed also in writing. This boy had been at a day-school. He was only twelve years old, and his school experience had already become a thing of the past. His father was a coal merchant in a small way, and this boy had, during the day, to go about with coals. A little further on was another writing-class, who had advanced so far as to write in books with pen and ink, and at a regular desk. At another bench was an arithmetic class; some learning to make figures, others working questions in proportion and simple interest. One rough, hardy, weather-beaten boy was as far as mensuration. He was an apprentice to a stone mason. Another boy, about fourteen, who attended a free-school during the day, was working questions in simple interest with great quickness and accuracy. In another corner of the room were four or five young boys learning the names of the letters of the alphabet, and also receiving some knowledge of objects by means of a few coloured drawings. The master was assisted in his labours by a few young men, who gave their services out of pure love for the work. There was more order preserved than might have been expected; and though the noise of so many classes proceeding at one time was considerable, still it was the noise of work, not of idleness.

The school closed at nine o'clock, and at half-past eight o'clock the books, slates, &c. were collected and put away. The boys all took their seats in front of the master, who read to them from the platform a portion of the life of Benjamin Franklin. It so happened that on this evening the teacher concluded the story of the life of Franklin, the same space on several previous evenings having been devoted to the rest of the life. The teacher took care to make the narrative as simple as possible, and made a practical application of the events in Franklin's life to the boys assembled, with the view of giving them encouragement not only in their studies, but likewise in their various occupations in life. It was really pleasant to notice the attention that prevailed among the boys, and the eagerness with which they drank in the narrative. Questions that were put to them elicited answers that showed they well remembered what had been told to them before. The greater number of these boys were engaged in labour of some kind during the day, and they were asked, in connexion with Franklin's life, if they liked to work? Only one boy, another apprentice in a foundry, answered 'No.' But on being questioned, he could give no reasons for his answer, and advantage was taken of the circumstance to give a short and pointed lecture to the school on the usefulness and honourableness of labour. A short hymn was then sung, in which all the boys joined, and the school closed.

The room in which this school met was, shortly after my visit, required as a soup-kitchen, and the boys were removed to another room in the same quarter of the town. Later in December I happened to pay a visit to it also. The room was used during the day as a girls' school, and was more convenient and comfortable, though not so large, as the first. It could not accommodate all the boys, and a desk and seats had to be

placed in the narrow lobby by which it was entered, to receive an advanced writing-class. On entering, two boys whom I had seen in the school at its old room sprang up, and asked me to decide which of their copy-books was the better written, both being quite proud of the progress they had made. In the room itself there was scarcely space to turn—boys reading, boys writing, boys calculating on every side. From this school I passed to another containing about forty boys, all of the same class as was found in that already described. Here the teacher was engaged with a class which was reading a poetical description of country life; and so completely town-bred and ignorant were nearly all the boys, that the teacher required to give an explanation of many of the unknown things alluded to in the lesson. The boys were most attentive, and read the lesson over and over again with great delight. In one corner I noticed three boys, the oldest about twelve, and the other two probably three years younger. Not one of the trio had either shoes or stockings; their dresses were all most ragged and torn; and they evidently belonged to the very lowest class of the population. 'The force of "raggedness" could no farther go.' One had a pencil in his hand, with which he pointed out to the others the names of the letters of the alphabet—an office that he performed with great pride and glee, in spite of his ragged clothes. His two pupils were all attention, and went over the names quite glibly. All the other boys were either writing on slates, or solving questions in the simple rules of arithmetic. One boy, about fifteen, was very vain of his progress, but he could not solve a question in multiplication. Though this lad was not at all dexterous in arithmetic, his 'education' had evidently been very extensive, for he was extremely sharp and 'wide awake.' His employment during the day was to carry out 'bottled porter' from a dealer to his customers.

Leaving this school, I proceeded to that for girls, which is kept in an airy room, well-lighted and heated. Two girls' schools have been established, both of which were obliged to meet in this room for a time, as the schoolroom of one was required for those boys who formerly met in that which is now the soup-kitchen. The girls were singing the closing hymn as I entered. There were nearly one hundred present, the majority being under fourteen years of age. Many were very young. They were much cleaner and neater in their appearance than the boys, and their conduct was far more orderly and quiet. At least one-half of them were without bonnets, and many had no shoes or stockings. The employments during the day of a great number of these girls are selling sand and wood-chips in the streets. They attend with considerable regularity, and two or three of the older girls have made sufficient progress to entitle them to become monitors. The girls' classes are conducted by female teachers, and kept altogether separate and distinct from those for boys.

A few other Ragged Schools have lately been opened in connexion with some of the places of worship in Liverpool.

Speaking generally, the pupils in these schools seemed to be careful, attentive, and diligent in their lessons, and their attendance is as regular as can be expected. The schools have now (January) been open without any interval for a period of six months; and many boys, as well as girls, have attended during the whole of that time.

Their attainments at entrance, as might be expected, were found very meagre, and it has been necessary to teach many their letters. The amount of instruction given in such schools must of course be small; for with such numbers of idle, undisciplined boys and girls, what can even the most iron-bodied and earnest-hearted teacher do? Still, these schools are doing good work. They descend to the very depths of society, and carry some glimmerings of light into the most benighted part of the population. They tame rudeness, and implant habits of decency and order, and that in itself is a great

object. They create a taste for knowledge, which will remain with the pupils through life. It will be years before the fruits of the work are seen; but while many men of eminence have acknowledged themselves greatly indebted to the instruction received in charitable institutions, we may yet hear men declaring that they owe their distinction to the work which they began while ragged boys in a 'Ragged School.'

THE ART-UNION.

THAT the present is a great and satisfactory epoch in the progress of the British nation, can hardly be doubted. Former times had their men, but now we have a general diffusion of the things which made the men illustrious. The age has neither a Shakspeare nor a Milton, but the capacity to apprehend and appreciate both is far more common than in their own day. We no longer write, perhaps, like the giant authors of old, for distant generations: genius no longer turns away, sick and indignant, from the unconscionable around, to fix its longing gaze on futurity. Our great living writers are the exponents of their own time, and a man who has anything to say worth the hearing, is sure to find a numerous and intelligent audience.

The advance of the national mind is satisfactory, not so much from its rapidity, as from its consistency. Although some departments of knowledge may be less cultivated than others, we are now a generally informed and enlightened people; and although the direct tendency of the age may be towards the useful and practical, we are far from neglecting the beautiful and ideal. This indeed may almost be said to involve a distinction without a difference; for the influence of both upon the minds and moral destinies of men is pretty nearly alike. At all events, luxury appears to succeed comfort by a natural law, and the cultivation of taste to grow out of the abundance of coarser acquisitions. The cotton manufacture, for instance, was an achievement of the practical spirit of the age. It gave us cheap clothing, but it did not stop there. Possessing cheap clothing, we set to work to improve and adorn it; till what was at first a source of mere animal comfort, became a fountain of taste and elegance.

If the triumphs of art do not in our day keep pace with the triumphs of science, there is at least a feeling for the beautiful diffused much more widely among the people than at any former period of the national progress; and as sound principles of taste are all-important in a state of movement like ours, we are proportionably pleased with the success of a journal devoted to the task of affording the public 'the means of justly ascertaining and estimating the progress of art.' The 'Art-Union' is now too well known to require any detail of its objects; but we may inform such of our readers as are not already acquainted with it, that they will find in its pages every kind of information concerning art and artists, both in this country and abroad, and that the work takes its name from the alliance which has of comparatively late years been established between the fine and useful arts. The chief literary feature of the part commencing the New-Year, is a statement of the Prospects of British Art; in which we are well pleased to find just discredit thrown upon government patronage, and the best influence declared to be that of 'educated example acting upon a sensitive, generally educated people.'

'Exhibitions of the fine arts,' says our author, 'and exhibitions of the manufacturing and mechanical arts, are now common to all our large towns; and we defy the greatest sceptic to doubt that there is real progress. In decorative art there has been also a great advance. To the advantages derived from science as applied to the arts, and of which we have almost daily evidence, it is unnecessary for us to do more than allude. Of

architecture we shall speak with reference only to that which is observable in street improvements; particular buildings indicate alone the talent of some eminent architect—a point we are not discussing; but it is from general results we must deduce the proof of general progress. Judging by this, then, who can deny that, within the last twenty years, greater general progress has been made than in a century prior to that date? The buildings in the new streets of the metropolis exhibit at intervals a well-designed and richly-decorated mass, or are marked with breadth and simplicity, combined with much novelty and appropriate treatment. Many houses recently erected also, such as those at Kensington—although at times reminding us of some delineated by Durand—have at least this merit, that, if not entirely original, they possess grandeur, and are effective. Not the least cheering in this branch of art, too, is the fact, that almost all our recent public buildings, of which opinion has favourably spoken, are from designs of artists comparatively unknown.' In painting, we are declared to rival fairly the French and German schools; many of our artists exhibiting 'a vigorous and pure imagination, great knowledge of character, skill in its delineation, aptitude to represent the dramatic incidents of life with truth, and domestic scenes with feeling.' Sculpture is said to be 'chiefly resigned to busts;' but surely some mention might have been made of the works, few as they may be, which give its character in this department to the time. In engraving, 'English artists occupy confessedly a very high place.' But they are unable to rival the productions of the continental engravers of the works of the great Italian masters, just as in painting we fall short of the genius of the latter themselves.

The prospects of art are declared to be highly satisfactory. 'We know it is the custom to assert of the aristocracy and the upper classes, that art among them is considered only as the appanage of rank and wealth; but it is not so. Knowledge and taste are combined, among the majority of these classes, with a liberal appreciation of the artist. Neither is this a mere fashionable, but a truly intellectual feeling. Thus we find in the manufacturing districts manifest signs of improvement—in design, in the chemical knowledge of colour, the laws of its employment, greater novelty and correctness of form; and that works of the commonest kind are now conducted upon principles which produce the highest. That an improved feeling does exist, we are proud to acknowledge, and far more to admit and to combine with it that which is observable among the middle and lower classes. There is now hardly a house you enter in which some engraving at least is not found, after an English artist, that but two generations ago, would have been held as only suited to the palace. No love of art! Go into the cottages of the poor, and see how art has displaced the prints of the "Twelve Knights," the titular "St George and very Apocryphal Dragon," the "Golden Game of Goose," and tawdry dramatic incidents from the stores of Messrs Belch and Langley, by Scripture illustrations, and cheap reproductions of works of a good class. No love of art! Why, art has descended to tea-boards, and refines even the productions of papier mâché. We repeat again, let our readers but refer to the pages of the "Art-Union" for the last year; it will guarantee our assertion of the present progress, and our hope of the future prospects of art as founded upon that progress. Yes, great as has been the extension of literature, will be that also of art; for art appeals to the same faculties of the mind for its appreciation. Like literature, it has its origin in fancy and the imagination, and is equally the type and relater of moral and historic truth.'

This part, like many former portions of the 'Art-Union,' contains numerous specimens of engraving of very high merit. A portrait of the Queen, by H. Robinson, after a miniature by R. Thorburn, is the frontispiece, and will probably be considered the best resemblance extant. A fairy tale by Mrs S. C. Hall,

which in itself is one of the chief attractions, is exquisitely illustrated in wood; and, upon the whole, in estimating the prospects of British art, we ought to include among the best evidences on the favourable side, the enlarged size, increased merit, and consequently enhanced price, of the 'Art-Union.' We may conclude our notice by extracting the following passages on house decoration:—

'When Louis, the reigning sovereign of Bavaria, commanded the construction of a new palace, he said to his architect, "I desire to build a palace which shall be 'All Art'; from the architecture to the commonest articles, everything shall be designed by my best artists; nothing shall be copied; I will have 'no upholstery.'" This project, worthy of a high and enlightened mind, has been fully carried out; and the new palace, externally and internally, is literally a monument of artistic invention. A grand idea is completed! From the saloon of entrance into the throne-room, a gradation of decoration is observed; beginning by simple forms and modest colours, up to the luxuriance of gilding, ornament, and vivid hues.

"I will have no looking-glasses to usurp the places I can occupy with pictures," was another of the sovereign's commands in the furnishing of his palace of art. Thus everything is in perfect harmony of style: whatever the style may be, it is strictly adopted; not an object violates the unity of thought.

In the most magnificent mansions of England this completeness has scarcely ever been attained; there is always some incongruous piece of furniture, some ill-patterned carpet, badly-designed curtain cornice, or ugly gilt frame. We are so much accustomed to these "upholsteries," that we become blinded to their anomalies, by valuing them only at the great sums they have cost.

Even in the architectural composition of the interior of the principal rooms of such mansions, what "monstrosities" of proportion, jumbings of character, and violations of forms are displayed. Lanky pilasters and column patchwork cornices, and clumsily massive chimney-pieces of the purest Carrara marble, carved into repulsive forms, without an atom of skill, much less of design!

'It is true a brighter dawn gently opens upon us, and the interiors of our houses are gradually becoming covered with *designed* ornament. Hope is, however, chilled by the certainty that much of good intention will be wasted by its being consigned to incapable hands. It is not here our province, nor does it suit our present purpose, to investigate all the bearings wherefore, or the under-current of influences which makes attempts sickly and feeble. All comment on the subject may be condensed into a sentence—"Employ an artist to design, and an upholsterer to execute." You cannot go into a shop and order works of art as you would a portmanteau. Study, cultivation, learning, and talent are wanting; they form no part of the stock in trade of the stone mason, the carpenter, or the upholsterer. If, therefore, we would make our houses palaces of art, let us impress upon our minds the noble "order" of the monarch of Bavaria—"I will have *all* art—I will have no upholstery."

NATURAL CLOTHING.

The clothing which grows from the bodies of animals is always suitable in quality and quantity to the climate and season under which they live. In hot climates the coat of quadrupeds is short and thin, but it thickens with increasing latitudes, and yields soft and abundant fleeces. At the poles it is externally shaggy and coarse, internally shorter and fine, as in the skin of the arctic bear. How defensive is the fur of amphibious animals; the beaver for example! How abundant and smooth upon birds as feathers, shutting up the heat of their warm blood, and opposing no resistance to the air through which they fly! The birds of very cold regions have plumage almost as bulky as their bodies; and those which live much in the

water have additionally both a defence of oil on the surface of the feathers, and the interstices of the ordinary plumage filled with delicate down—a bad conductor, which abounds particularly on the breast, as it, in swimming, first meets and divides the cold wave. Then there are animals with warm blood which live in the water—for example, the whale, seal, and walrus; but neither hair nor feathers oiled would have been a fit clothing for them; they accordingly derive protection from the cold water by the enormous amount of blubber or fat which surrounds their bodies; it is a non-conductor.—*Armed.*

THE DAISY AND THE STAR.

THE modest daisy on the hill,
That drinks of morning dew its fill,
And spreads its leaflets to the light,
And then in quiet meek repose
Its crimson coronet doth close
Beneath the shade of night,
Lives calmly out its little day,
Then fades unseen away.

And yonder shining star,
That dwells in heaven afar,
Whose trembling ray no more is seen,
Lo! in the myriad orbs of light
That spangle o'er the veil of night,
Than is the daisy on the green,
Will but live out a longer day,
Then pass unseen away.

C. WITCONS.

SOLAR HEAT.

In all our excursions over the surface of the globe, innumerable objects excite our admiration, and contribute to inspire delight; but whether our gratitude is awakened by the verdure of the earth, the lustre of the waters, or the freshness of the air, it is to the beneficial agency of heat, under Providence, that we are indebted to them all. Without the presence and effects of heat, the earth would be an impenetrable rock, incapable of supporting animal or vegetable life; the waters would be for ever deprived of their fluidity and motion, and the air of its elasticity and utility together. Heat animates, invigorates, and beautifies all nature; its influence is absolutely necessary to enable plants to grow, put forth their flowers, and perfect their fruit; it is closely connected with the powers of life, since animated beings lose their vitality when heat is withdrawn. Such is the universal influence of this powerful agent in the kingdoms of nature; nor is this influence diminished in the provinces of art. It is with the aid of heat that rocks are rent, and the hidden treasures of the earth obtained; matter is modified in countless ways by its agency, and rendered subservient to the uses of man; furnishing him with useful and appropriate implements, warm and ornamental clothing, wholesome and delicious food, needful and effectual shelter.—*Treatise on Heat.*

Just Published,

SELECT WRITINGS OF ROBERT CHAMBERS.

Volume I. Price 5s. cloth.

These writings will be issued in seven post 8vo. volumes, embellished with vignette engravings, price 5s. each. A volume will appear every two months.

SUBJECTS OF THE VOLUMES.

- VOL. I. & II. Essays Familiar and Humorous.
- III. Essays Moral and Economic.
- IV. Essays on Philosophical Subjects, Sentimental Essays, and Historic Sketches.
- V. History of the Rebellion of 1745-6.
- VI. Traditions of Edinburgh.
- VII. Popular Rhymes of Scotland, &c.

W. and R. CHAMBERS, Edinburgh; W. S. ORR, 147 Strand, and Amen Corner, London; J. M'GLASHAN, Dublin; and all Booksellers.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. S. ORR, 147 Strand, and Amen Corner, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 163. NEW SERIES.

SATURDAY, FEBRUARY 13, 1847.

PRICE 1½d.

PLAYFUL IMPOSTURES.

FICTION is one of the great elements of life. We cannot constantly present ourselves as exactly what we are. There is an incessant craving to be something else; to go out of ourselves, for however short a space, or to whatever little apparent purpose or end. We see this in the sports of children, where, by the mere prompting of the instinctive mind, each readily and easily assumes and sustains a feigned character, and all becomes a masquerade. We see it in the social meetings of the adult, where each sets himself to be something a little more refined and pleasant than he is in his common moments, and the whole are gratified by the temporary sinking of the homely reality. It is not affectation, it is not an aping of superiority, which is here concerned; it is merely a tendency to seek a relief and a pleasure in the exchange of the actual for the ideal. An immense proportion of the innocent pleasures of life arises from this source: jokes, badinage, rally, are various forms of it, which, though sometimes carried to a bad excess, are all excellent in moderation, and under the government of good feeling. I thoroughly believe that life would be a desert, but for the little fictions thus mixed up with it; which everybody understands, and which therefore do nobody any harm.

It is necessary, however, to keep a rigid watch upon this disposition, lest it pass beyond the line of innocence. And the ethics of fun is well worthy of serious consideration. Wherever a jest has the least chance of hurting any one's feelings, much more wherever it tends to damage of a more practical kind, it ought of course to be suppressed. Nothing will justify its being carried forward, unless its whole consequences can be foreseen, and these are clearly limited to a little passing merriment.

In some places, and in certain little societies, there sometimes reigns a habit of what is variously called *hoaxing*, *trotting*, and *selling*; that is to say, practising upon the faith of individuals by stories possessed of no real foundation, or leading them into expectations which are to end in ludicrous disappointment. It is an extension of April fooling; and though certainly we can suppose more dignified amusements, yet if all are willing to take and give in this way, and nothing but a laugh ever accrues, no one can well find fault with the system. The handsome little town of — lives, as far as mirth is concerned, upon jests of this kind, and broad gins have as yet been the only consequence. When I was last there, the predominant drollery was a dinner which had been given by a little party of wags to one of their set, noted for his numberless successes in quizzing, the occasion being his completing a small villa for his own residence. He had been led to understand

that his friends were to crown the feast by presenting him with a piece of plate: and they were true to their word; but it was a brass-plate for his door, containing a name for the house, in which the familiar name of the owner bore a part! Now, if a little joke of this kind can enliven the natural dulness of a country town for a week, and the subject of it laugh among the loudest, and even extend the fun, as this gentleman did, by putting the door-plate to its proper use, there is certainly some good done, and no harm.

Another case.

On a misty January morning I found myself seated at the breakfast table of my kind-hearted friend Sir Hugh Melford, along with two other guests, and the ladies of the family. It was the morning of an appointed shooting party, and a third guest was expected.

'Pray,' said I to Miss Selina Melford, 'who is the other gentleman that Sir Hugh expects to make up his set?'

'Oh, it is John Stirling, eldest son of our neighbour Sir Samuel Stirling; an excellent person, whom we all like very much. We lately played him an amusing trick.'

'What was that?'

'Why, the last time he came here to shoot, we dressed up a female figure, which we planted at table, with its back to the light; and when he arrived, we asked him to sit next to *that lady*, and introduced him to her. He bowed, and made a few remarks, without discovering anything but that she was rather stiff in her manners. We had such fun about it afterwards!'

At this moment Mr Stirling was announced, and Sir Hugh was asked out for a moment to see him. Presently our host returned, ushering in Mr Stirling, and introducing as his companion and friend a remarkably handsome mustached youth, whose name was given as Count de Leudher, an officer in the Austrian service. Greetings passed between Mr Stirling and the ladies, and the count made his bow, but unfortunately, from ignorance of the language, was unable to pay his respects in words. Very soon we were all once more seated, and breakfast went on right mirthfully, the ladies evidently being greatly interested about the stranger.

So unconscious did he in the meantime appear to be of the chat going on around him, that 'very handsome and interesting!' 'his melancholy air reminds one of Thaddeus of Warsaw,' and other sufficiently broad compliments, passed freely among the ladies, in implicit reliance upon his inability to understand their words.

'Selina,' said Miss Melford, 'this must be the person we heard of being at Stirlingfield?' She asked the question of Mr Stirling, and was answered in the affirmative. I was then informed that, about a fortnight ago, their enthusiastic friend, Miss Fanny Bloomfield,

coming to visit them, had met in the coach a fine-looking youth, whom she took for a foreign count at least, if not a prince, and who had alighted at the Stirlingfield gate. He had, she said, eyes like the dove, hair like the raven, and a look that might command an army! They had had a great deal of talk on this subject; and the curiosity of the Misses Melford was only increased when Fanny Bloomfield, going soon after to Stirlingfield, wrote to them that the foreigner was staying there—that he *was* a count, belonging to the Austrian service—and the most fascinating person she had ever met. ‘Really,’ declared all the ladies with one consent, ‘Fanny has gone not a bit beyond the truth.’ I remarked a slight smile play round the mustache of his countship at this remark, but readily supposed that he might understand a few words of English, although unable to speak it.

I finished breakfast, without for a moment dreaming that the count was anything but a count, or Mr Stirling anything but the downright good-natured man he appeared to be; but in the drawing-room, to which we soon after adjourned, Sir Hugh took an opportunity of telling me how the case really stood. The stranger was, although in the Austrian service, a Briton, and a cousin of Mr Stirling—in fact, the son of another gentleman of the neighbourhood—and the affair was an attempt on the part of Mr Stirling to revenge the trick lately put upon him by the Misses Melford. ‘Oh, very well,’ said I, ‘let the joke be carried on by all means. For my part I shall enjoy it, if it were for nothing else but as an overthrow to my friend Miss Melford, who tells me, at every difference we have about matters of fact, that she is *always* right, and therefore I *must* be wrong.’

‘That’s right,’ quoth Sir Hugh. ‘It will be a good joke indeed if she be taken in. Let us by all means keep it up till after dinner if possible.’

The shooting party now set out with its proper train of attendants, and myself as a civilian attaché; and for four hours we rambled along the high grounds in quest of hares, pheasants, and moorfowl. What success my friends met with it is of no use to rehearse; neither is it important that I should specify the various adventures and misadventures of the party. Suffice it, that we met in a little lodge to lunch at two o’clock, and during the repast, could speak of nothing but the delusion now in progress, which, however, we all feared would not hold out till dinner, as there were ten chances to one that some communications among servants would betray the real quality of the count. By and by shooting was resumed, and I, after accompanying the party a little longer, proceeded to the castle, in order to write some letters before dinner. I entered the drawing-room, where the ladies sat with a mind and ears prepared for all imaginable clamours; but behold, all was safe. They were innocently telling Lord Montresor, who had come upon a morning call, ‘what a delightful young German count had arrived from Stirlingfield that morning; that he spoke only German, not a word of English,—not even French. They hoped he was, like all Germans, musical, and that would help to make the dinner pass pleasantly,’ and so forth.

I felt thankful, and joined in the conversation. His lordship afterwards met the shooting party, was let into the secret, and invited to stay to see it developed at dinner, but, to his great regret, was under a prior engagement, so that he only could indulge in a hearty laugh at the affair impending over his fair friends, and then leave the party to their own enjoyments.

At seven, the party assembled in the drawing-room

for dinner, when the impression formerly produced by the count was, if possible, deepened, as he now appeared in an attire that set off his person to the best advantage. Before this, we had settled upon the procedure to be observed in the dining-room, and it had also been deemed right that our hostess, Sir Hugh’s mother, should be let into the jest. I may remark, as a proof of the success of the deception, that this lady had some difficulty in believing us when we undeceived her, fearing that the only trick lay in this new direction. The count, as presumably the person of greatest consideration present, was accorded the honour of leading out the lady of the house. Dinner passed without his saying more than a few words in German to Mr Stirling. Some attempts were made by one or two to make a conversation in French; but unluckily they were all failures. At length the servants left the room, and the denouement of the plot took place in the manner agreed upon.

‘Mr Stirling,’ said I very formally, ‘did your friend ever meet a person who is never wrong? I wish you would tell him that Miss Melford says she is never wrong, never deceived, and never makes mistakes.’ She looked a little queer at my pointing her out to notice in this manner, and her puzzlement increased when she saw smiles on the faces of all but the ladies present.

Nevertheless she answered, laughing, ‘Well, it is the case. Somehow I am never wrong. I am sometimes almost distressed at my own correctness, as if it were what a human being ought not to be able to boast of.’

‘But do you think you *could* not be deceived in anything?’

‘No—I think not. I never *am* deceived, and therefore never *could* be.’

‘Very well,’ said I to Mr Stirling, ‘you hear it from her own mouth. I beg you will tell it all to your friend in his own language.’

Mr Stirling did so in a few words; the count smiled hard, and then Sir Hugh rose up.

‘My friends,’ said he, ‘I feel impelled on this occasion to resort to an old fashion, and ask you to join me in drinking the health of a gentleman whom it has given my mother and myself much pleasure to see here to-day. I am sorry he does not understand our language, but I hope he will do so by the time he returns to our neighbourhood; though this is not necessary to make us wish for a repetition of his visit. I am afraid his day with us has been a somewhat stupid one on this account; but I trust he will believe that this is matter of regret to us, and that, as far as good-will can go, we are anxious to make it up to him. Without further preamble, I propose the health of *Captain John McEwan*!’

The familiarity of the name now announced broke the plot at once. It is needless to say the sensation was tremendous; that the ladies looked a thousand discomfitures; and that the rest of the company, bursting through all rule, raised a shout of merriment which penetrated to the servants’ hall, where it was at first mistaken for the alarm at some direful accident.

It is but fair to the ladies to say that, after the first moment, they entered heartily into the humour of the affair; so here, too, some good accrued, and no harm.

When, as in the above case, the subject of the deception is one who stands very strong in a belief that he cannot be deceived, the enjoyment of the joke is of course greatly enhanced to third parties. Such was the character of an imposture which was practised a number of years ago by a lady of remarkable representative talent upon a counsellor in high practice at the Scottish bar, and of literary celebrity also, who had expressed his belief that she could not, with all her dexterity, impose upon him. The tale was told in ‘Blackwood’s Magazine’ by Mr Galt, with a strong dash of his own peculiar manner, but in the main faithfully; and to this record we resort for a brief sketch of the incidents.

One day when the counsellor (whom Galt calls Mr

Jamphler) was to entertain a party, inclusive of the young lady, at dinner, he was told, while dressing for that meal, that two ladies desired to see him on urgent business. Joining them in the library, he found an elderly matron, in tortoiseshell spectacles, and a huge black bonnet, attended by a blushing young one. The senior female announced herself as Mrs Ogle of Balbogle, come to Edinburgh on purpose to take the benefit of counsel from the learned gentleman, whom she forthwith proceeded to compliment in a most extravagant style. 'But mine's a kittle case, Mr Jamphler,' she proceeded, 'and it's no a man o' sma' capacity that can tak it up.' If her late husband had been to the fore, she would not have needed to trouble anybody; 'but he has won awa out of a sinfu' world, and I'm a lanely widow;' with much more to the like purpose.

Mr Jamphler, getting impatient, suggested that she had better consult her agent.

'My augent!' she exclaimed; 'ye're my augent—I'll hae nae other but you—I hae come here for nae other purpose than to confer wi' you anent my affair—'

'Well, but what is it—what is it?' interrupted the counsellor.

The lady then made him sit down beside her, introduced her daughter, and gave a sketch of her family connexions, which produced another burst of impatience. At length he asked her pointedly what was her business. This only led to more palaver.

'Howsomever,' she at last proceeds, 'being, as I was saying, left a widow—it's a sair thing, Mr Jamphler, to be a widow—I had a' to do, and my father having left me, among other things, o' my bairns' part of gear—for the Barwullupton gaed, as ye ken, to my auld brother the laird, that married Miss Jenny Ochiltree o' the Mains; a very creditable connexion, Mr Jamphler, and a genteel woman. She can play on the spinnet, Mr Jamphler. But no to fash you wi' our family divisions: among other things, there was on my bit grund a mill and a mill, situate on the Crokit-burn, and I lent the mill to a neighbour to dry some aits; and, Mr Jamphler—oh what a sight it was to me!—the mill took low, and the mill likewise took wi't, and baith gaed just as ye would say a crackle, and nothing was left but the bare wa's and the steading. Noo, Mr Jamphler, wha's to answer for the damage? Howsomever, Mr Jamphler, as I can see that it's no an aff-hand case, I'll bid you guid day, and ye'll consider o't again the morn, when I'll come to you afore the lords in the Parliament House.'

The counsellor was now, it may be supposed, in no small tribulation. The lady, however, was not yet done with him. Rising and going to the window, she cried, "Oh! Mr Jamphler, the coach that brought us here—I wouldna come but in a coach to Mr Jamphler—but it's gone. Oh! Mr Jamphler, as I'm a wee o' a lamiter wi' the rheumatics, will ye hae the kindness just to rin out for a coach to me? I'll be very muckle obliged to you, Mr Jamphler; it's but a step yonder to whar the coaches are biding on outlook."

'Mr Jamphler rung the bell, and ordered his servant to fetch instantly a coach.

"But, Mr Jamphler," resumed Mrs Ogle of Balbogle, "I hae another favour to ask. Ye maun ken I'm sometimes tormented wi' that devility they call the toothache; are ye acquaint wi' ony doctor than can do me good?" Mr Jamphler immediately mentioned our friend and correspondent, the Odontist. "Eh!" said Mrs Ogle of Balbogle, "the famous Dr Scott! But whar does he bide, Mr Jamphler?" The urbane counsellor mentioned his address. "Ah! but, Mr Jamphler, ye maun write it down, for I hae but a slack memory." Mr Jamphler did so immediately; but the lady, on looking at the paper, said, "Na, na, Mr Jamphler, that winna do: I canna read Greek: ye maun pit it in broad Scotch: I'm nane of your novel leddies, but Mrs Ogle o' Balbogle." Mr Jamphler was in consequence obliged to write the address more legibly, and the coach coming to the door, the lady and her daughter

withdrew. Mr Jamphler then joined the company in the drawing-room, and soon after, the young lady, in *propria persona*, with the Odontist's address in her hand, was announced as Mrs Ogle of Balbogle.'

These anecdotes serve to illustrate the circumstances under which little playful impostures may rightly be carried on. No satire being indulged in, the parties being friendly, and disposed to enjoy innocent jokes even at their own expense, no harm can well arise. Where, however, all are not of one humour, or where the jest rubs on a known sore, or for certain will place the subject of it in a false and ridiculous position, or even gall an unlucky over-sensitiveness of nature, the whole procedure must tend to mischief, and therefore is to be unhesitatingly condemned.

THE CENTRAL SUN.

LECTURES on astronomy have for many years been highly popular with a large portion of the public; in the smaller provincial towns, the arrival of an itinerant lecturer, and the delivery of his 'course of three,' illustrated by an orrery, was an event productive of general satisfaction, and served to enliven one or two of the dreary weeks of winter. Most readers will remember the average amount of information imparted on these occasions: commencing with the sun, the lecturer gave a description of our solar system, taking the planets in their respective order, their bulk, orbital motion, and distance from the central luminary, and, assisted by a magic lantern, finished with representations of the moon's phases, Jupiter's belts, and Saturn's ring. Something was generally added that largely excited the wonder of the auditors, who went away fully persuaded that they had learned the whole scheme and compass of astronomical science—for them it had no more secrets.

It is no longer the same in the present day: with increased knowledge, has grown up, to a certain extent, an increased desire to comprehend it; the old limits have been found far too narrow for an intelligence ever seeking to enlarge its boundaries; and no sooner is a great thing achieved, than it is immediately made a starting point for something still greater. The popular mind is not now satisfied with the aliment it fed on ten or fifteen years ago; it has become in some sense the reflex of the progress of science—wider in its grasp, but more simple, certain, and accurate.

As a consequence of this movement, popular astronomy now embraces something beyond the sun and planets: it has learned something of other systems beyond our own—of double and triple stars, many of them inconceivably remote; of nebulae; and a new planet. But there is one fact, first announced by the elder Herschel, which, although well known to men of science, has been much less frequently brought into general notice than the others, in direct opposition to commonly received opinions. The prevalent idea respecting our sun is, that, with the exception of a movement round its centre of gravity, it occupies a fixed and invariable position in the heavens. Recent researches have, however, verified the assertion, that, in common with the whole universe, it has what is called a 'movement of translation' through space in obedience to some mighty and unknown influence, analogous to that which impels the minor planets and moons in their orbits. And we shall now endeavour to give an outline of the present state of our knowledge respecting this interesting subject.

As we have already stated, the late Sir William Herschel was the first to demonstrate what had for some time been suspected by astronomers—the progressive movement of the sun through space. In the course of his persevering investigations of the heavens, he had at different periods made three surveys of the stars comprised in the catalogue published by Flamsteed, the first astronomer-royal. On each occasion he found that the positions differed greatly from those marked in the catalogue: two stars of the fourth magnitude in the

constellation Hercules, which Flamsteed had observed, were no longer to be seen. The same phenomenon was remarked also in Cancer and Perseus: the stars were either lost, or so far removed, as to be no longer recognisable, while several new ones were visible which had not been previously noticed. Herschel extended his observations to a large number of the stars and constellations, and the result in all cases showed that the most extraordinary changes had taken place since the days of Flamsteed; and in 1783, in one of his communications to the Royal Society, he wrote—'This consideration alone would lead us strongly to suspect that there is not, in strictness of speaking, one fixed star in the heavens; but many other reasons, which I shall presently adduce, will render this so obvious, that there can hardly remain a doubt of the general motion of all the starry systems, and consequently of the solar one among the rest.'

Lalande had thrown out the supposition that 'the sun has a real movement in absolute space;' but Herschel went beyond him—he proved it. As Copernicus, two centuries before, had established that the sun's apparent motion round the heavens was due to the real motion of the earth, so did the English astronomer show that the changes of position of the distant stars was caused not only by their own movement, but chiefly by that of our system. Still pursuing the inquiry, we find him writing in 1805:—'A view of the moons, or secondary planets, round their primary ones, and of these again round the sun, may suggest the idea of an additional motion of the latter round some other unknown centre.' He demonstrated beyond a doubt that the sun, with all its attendant planets, was moving with great velocity towards one of the stars in Hercules. The further investigation of the subject, it has been said, was 'one essentially for modern times;' and the high degree of perfection now exhibited in the construction of instruments, has enabled astronomers to distinguish between apparent and real motion, and to confirm Herschel's bold and original views in every particular. Many anomalies in the movements of the stars were at once explained by the fact of the sun's motion in space. So rapid is this motion, that, according to Bessel, it amounts to 3,336,000 miles in a day. The effects of this amazing velocity are eloquently described by the celebrated Humboldt. He observes—'The beautiful stars of the Centaur and of the Southern Cross will at some future day be visible in our northern latitudes, whilst other stars (Sirius, and the stars forming the belt of Orion) will no longer appear above the horizon. The place of the north pole will be successively marked by Cephei and Cygni, until after the lapse of twelve thousand years, when Syra will become the brightest of all possible pole stars. These statements serve in some degree to realise in the mind the magnitude of the movements which proceed uninterruptedly in infinitely small divisions of time in the great chronometer of the universe. In every point of the celestial vault we recognise the dominion of progressive movement, as on the surface of the earth, where vegetation is constantly putting forth its leaves and buds, and unfolding its blossoms.'

The improvements in telescopes, that enabled astronomers to penetrate farther into space, gave them at the same time the means of more accurate observation than they had previously possessed. The heavens were 'gauged' in every direction, and carefully mapped out. Among the more interesting phenomena brought to light by these researches were those of double stars, of which about six thousand are now known, chiefly by the labours of the Herschels, father and son, and Struve, a Russian astronomer. The difference in the appearance of stars was shown to depend not on their size, but on their distance. They are, however, always classed according to their magnitudes, ranging from 1 to 22. No. 1 denotes the brightest and nearest stars, and 22 the smallest and most remote: the first six only are visible to the naked eye. The fixed stars were found to be comparatively, and not absolutely, stationary, and to be the centres of

systems similar to our own. The discovery of the planets revolving round these centres yet remains to add another to the great triumphs of astronomical science.

The double stars revolve one around the other, and are supposed to present the simplest or elementary form of stellar motion. Besides these binary systems, there are others—triple, quadruple—gradually increasing in number and complexity. Wherever the observer turns his gaze, he discovers movement, in obedience, as it were, to one universal law of gravitation: wherever stars are clustered, they group themselves in increasing brightness round a definite though unseen point of attraction; and it is not surprising that philosophers should have speculated as to the existence and position of some mighty centre, round which, in the course of countless ages, the whole stellar universe revolves; or, in the words of Schiller, 'amid ceaseless change seek the unchanging pole.'

Various stars have been fixed on from time to time as the centre round which all revolved. Sirius, from its magnitude and brightness, was often supposed to be the occupant of this position; but the observations of later astronomers, Argelander and Bessel, have shown that this star has a sensible movement of its own apparently around some greater body, far remote, and invisible to us; so that Sirius, instead of being the chief of the army of fixed stars, is only one of the subordinate members of a partial system.

So carefully have the heavens been explored of late years, that but few of the greater movements of the stars are unknown to us; and looking at the distribution of these through the realms of space, no point has been found filled by a star of the first magnitude which fulfils the condition we have just indicated. Hitherto, the movements appear to be greater or lesser optically only, and it is one of the objects of modern astronomy to define these movements with exactitude by the parallax. The same reasoning may be applied to the double stars—none of them show the existence of any considerable mass. From all these negative considerations, the conclusion has been come to, that it was useless to look for a central body in our more immediate stellar system.

The fact that, in the partial systems of fixed stars, and especially those of double stars, there is not, generally speaking, a great superiority of mass in one of the bodies—and that, on the contrary, the two masses are almost equal in the greater proportion of them—has necessarily thrown doubt on the existence of such a central body as has frequently been described of an enormously preponderating mass.

If such were the case, we should see the most active movements in the neighbourhood of this mass, as in our own system we see the most rapid revolutions in the planets nearest the sun. By the same analogy, supposing the central mass to be invisible, we should see the stars in some quarters of the heavens moving much more slowly than those situated nearer the central region. We should not find, likewise, any more active movements than in this region, excepting, perhaps, in some of the members of our own system already referred to.

Foremost among those who have directed their attention to this subject is M. Maedler, the Russian astronomer at Dorpat, in Esthonia, who is already well known as author of an admirable geographical map of the moon. From a series of observations continued during a period of six years, he has come to the conclusion that the Newtonian law of attraction, which regulates our solar system, exists also in the systems of the fixed stars. It is difficult to convey an idea of the method pursued in working out results involving an acquaintance with the most abstruse details of astronomical science. The pilot of a ship feeling his way along with the lead on a foggy day, might be instanced as a comparative illustration of the process by approximation. After going through the various hypotheses

to which we have referred, M. Maedler treats of the Milky Way as the fundamental plane of our stellar groups. Its general line of direction describes more or less perfectly a great circle, dividing the heavens into two unequal portions: the northern or smaller portion being comparatively devoid of stars, while the southern half, near to which we are situated, is thickly studded. By a series of observations of groups, as well as of individual stars, M. Maedler deduced approximations for the position he was seeking, and, rejecting one after the other, arrived, after persevering exertions, at what he conceived to be the true centre in the group of the Pleiades; which, to use his own words, 'is the pivot round which the fixed stars, as a whole, describe their immense orbits.'

It is generally known that, among the most remarkable of the stellar groups, there is none comparable to the Pleiades for splendour or number of stars. The closeness with which they are placed is not merely optical. They are found in a region rich in stars, and answering well to the other general conditions which we have endeavoured to explain. The perfect concord existing between the determinations of the proper movements of these stars, notwithstanding their minute quantities, is cited as a proof of the correctness of astronomical catalogues, and thereby facilitating the labours of future observers. M. Maedler compares the observations of the most eminent British and continental astronomers on this group and some of the neighbouring stars—taking, first of all, twelve stars situated within 5 degrees of Alcyone, the brightest of the Pleiades; and next, thirty at a distance of from 5 to 10 degrees; and lastly, fifty-seven stars, whose distance is from 10 to 15 degrees. Observations on these stars prove that, with some exception, they all have a positive motion towards the south. The most numerous of the exceptions are in the fifty-seven last mentioned: forty of them having moved but two seconds of a degree in eighty-five years, it is difficult to determine the direction. The fact, however, remains, that of the one hundred and ten stars enumerated within 15 degrees of Alcyone, the movements of sixty of the number are towards the south, and in no case towards the north. It would be idle to contend that such a result is the effect of chance: it has been further proved by observations on one hundred and seventy-two stars of Bradley's catalogue; and the direction to the south, though in many instances feeble, is not the less certain.

'Although,' continues M. Maedler, 'it results, from what precedes, that the region of the heaven which I have chosen satisfies the conditions indicated, it is not less necessary to submit it to every possible proof. Many trials with different combinations have convinced me that no other point could be found to answer so well as the one I have adopted. I can state, therefore, as the result of my researches, that the group of the Pleiades is the central group of the entire system of fixed stars extending to the exterior limits determined by the Milky Way; and that Alcyone is the star of this group which appears the most probably to be the true Central Sun.' Light is five hundred and thirty-seven years in travelling to us from this Central Sun, whose mass is 117,400,000 times larger than that of our own luminary. The revolution of the latter round Alcyone requires a period of 18,200,000 years; and supposing the movement to continue the same as at present, the sun will reach the ascending node of its orbit in the year 154,500 of our era. The calculations are not given as positively determined, but as the nearest approximation hitherto obtained.

The mind is bewildered in the contemplation of such tremendous phenomena, of whose workings only the dimmest perception can be realised; sufficient, however, to impress us with the infinite majesty of Nature. M. Maedler, in concluding his observations, expresses the hope that he has pursued an object favourable to the progress of science, one that may possess such interest for other scientific men, as to lead them to push

the inquiry still further, to investigate still more successfully the system of the universe. In whatever way his appeal may be answered, he has not the less rendered a new and signal service to science, and opened a wider field of astronomical research.

THE DAUGHTER OF STANISLAUS.

A STORY.

It was the night of the 15th of February, and intensely cold, and notwithstanding the night and the cold, a young man, rather thinly clad, was lurking about the castle of Weissemburg, a small town in Alsatia, some leagues from Strasburg. After having made two or three circuits about the castle, he stopped before a Gothic window, through the curtains of which light was visible.

He was evidently waiting for some one, and soon he was relieved from his solitude by the approach of a person wrapped in a heavy cloak.

'I am glad you are punctual, Mikaël,' said the newcomer; 'now for the work in hand. In that castle, perhaps in that room before us, is Stanislaus, late king of Poland. All I desire is, that you contrive to get him to use this snuff-box. It contains good Spanish snuff, an article of which he is fond. Here also is a basket of porcelain. You are to sell the whole. Maria Lesczinska, the daughter of Stanislaus, will buy it all from you.'

'All very good, my lord,' replied Mikaël; 'but should I not have a little payment in hand to excite my mercantile diligence? Look at my miserable clothing, which is even at this moment insufficient to keep out the cold; and my mother, too, she is in abject poverty—she is both cold and hungry.'

'So long as Stanislaus lives, both you and she must be cold and hungry,' was the only answer his employer deigned to give him as he strode away.

Mikaël, it may be imagined, was on no good errand. Lingered about the castle till pretty well on in the morning, he presented himself at the gate, which opened to let out a servant, going upon some commission for the household. He approached and said, 'Have compassion on me, sir, and procure me an audience of the Princess Maria.'

'Another beggar coming to ask her charity!' said the domestic abruptly; 'and he is early enough.'

'Ah, sir,' said the youth, 'I am a child of Poland; banished like your master, but still more unhappy than he, inasmuch as I am alone in the world.'

'You are coming, then, as his countryman to ask alms of him?' interrupted the valet.

Mikaël replied humbly, 'I am come to sell to the princess all that remains of former wealth—some china.'

'Oh, that is quite a different matter,' answered the servant. 'Stay there—I will let the princess know; and closing the gate after him, he went back into the house.'

The poor youth waited for a long time before the door opened. The day was far advanced, and the rays of the sun had succeeded in making their way through the gray clouds of a wintry sky, when a gentle voice roused him from the stupor into which the cold was fast throwing him, saying, 'I am told you have some beautiful porcelain for sale?'

At a glance, Mikaël perceived that the speaker was a young girl, with a countenance rather pleasing than pretty: she was accompanied by a middle-aged lady, who did not seem to be in the best of humours. It may be that the early rising was not very agreeable to her, or else the cold of the morning, from which the furs in which they were both closely wrapped could not altogether protect them.

'Ah, princess,' said Mikaël, giving a most piteous tone to his voice, while his foreign accent lent some probability to his words, 'I am a poor child of Poland,

whose father perished in battle in the service of King Stanislaus. Come to France with my mother, who was of a good family, we have been obliged to sell for our subsistence, little by little, all that remained to us of past opulence; now, only this porcelain is left to us.'

'Poor boy! Let us see your china,' said the princess kindly. 'But first come in, it is so dreadfully cold here.'

'What are you thinking of, princess,' whispered the old lady to Maria, 'to introduce a stranger into the castle?'

'But this is a Pole, Mockzinska,' observed the princess.

'What proof have you that he is?' replied Mockzinska. 'I am perhaps wrong, dear princess, but your noble father's life has so often been threatened, that it has rendered me suspicious; besides, this man has a most forbidding countenance, and a downcast look, which, in spite of myself, repels me.'

'I confess, Mockzinska, that, like you, I am obliged to struggle against the prejudice produced by the expression of his countenance,' said Maria, still in a whisper, and looking at the pretended Pole, who at this moment betrayed a marked uneasiness. 'But, after all, the poor boy did not make himself. Is it his fault that he is ugly, and ought we to visit it upon his head? However, there is no harm in being cautious, so we may as well look at the china outside.' Then approaching Mikael, she added, raising her voice, 'Let us see your porcelain, my friend.' The face of Mikael brightened at this demand, and he hastened to open his basket.

'Here,' said he, drawing out one by one the articles, which he presented alternately to the princess and her governess, 'is a china vase, with teacups of a set which a sea-captain, a wealthy relative of ours, gave to my mother the day of her marriage with my father. Nothing but sore distress could make us part with so precious a souvenir. But look here! Oh, this article, though only in Dresden china, is dearer to me than all! It was the snuff-box which my father had in daily use. I have heard it said that King Stanislaus is particularly fond of Spanish snuff; indeed I could not be a Pole and be ignorant of it, for all the Poles are so warmly attached to their former king, your noble father, and the father of us all, if I may dare call him so, that we know his tastes, his habits, his likings and dislikings, just as we do those of our natural parents; and knowing this, yesterday I spent the little I possessed in buying from an old Spaniard what remained to him of this snuff. I have filled the box with it, and I think, princess, that you will have much pleasure in presenting your royal father with what he likes so much.'

'Is it scented?' inquired Maria.

'I do not offer your highness a specimen,' replied the false merchant, opening the box, but holding it at a distance from the ladies, 'because it is very powerful—very powerful; it would get into your head, particularly into that of a young person. It requires the solid brain of a man in the prime of life to bear a pinch.'

'How much is the box and the snuff?' demanded the princess.

'Will not your highness take all?' inquired the merchant.

'Yes. How much are they altogether?' said the princess with a complacent look into the interior of the basket.

'Going to buy all! How can you think of it, dear princess?' interrupted the governess. 'Did you not yesterday give to two poor children, who were crying with cold, all the money you had except that beautiful louis-d'or with the effigy of the young king of France, Louis XV., and which you prize so much, that you would buy nothing this week in order not to spend it?'

'But, dear Mockzinska,' said the princess with the coaxing look that so well became her almost infantine youthfulness of expression, 'only think what a delight to give my father some of that Spanish snuff, which he

is so fond of! And I think this porcelain so pretty, that if the young man will let me have the whole for my louis—'

'That is exactly what Monsieur Levi, a toy-merchant, offered me yesterday morning,' said the young Mikael, believing, by the help of this lie, to make the princess more eager to buy.

'And you refused it?' said the princess.

'Yes, madame; but I will not refuse you,' replied Mikael; 'for since I may choose, I would much rather have you for a customer. So here is my basket.'

'No, keep it,' replied the princess, 'while I go for the money.'

The princess and her governess now re-entered the castle, leaving the pretended Pole waiting for them. He was sauntering about the gate, when suddenly his look became fixed, and his countenance assumed a strange expression; and though the bargain had been concluded, and he on the point of receiving his money, he snatched up his basket and disappeared at full speed.

The person who had thus caused his alarm was a poor beggar woman, well known in all Weissemburg, not less for her honesty than her poverty.

The princess soon returned with her beautiful louis-d'or, and was gazing upon it as it sparkled upon her white glove, as we gaze on a beloved object we are to see no more, when, raising her eyes to address the merchant, she found that both merchant and porcelain had vanished.

She looked around in surprise, but perceiving only the old beggar woman, she called her. 'My good mother,' said she, 'do you know where a lad who was selling porcelain is gone—he was here not a moment ago?'

'I have seen no one,' replied the poor woman in a tone so expressive of extreme weakness, that the princess felt moved to the bottom of her heart.

'What is the matter with you, my good woman?' said she kindly.

'Cold and hunger,' replied the beggar.

'Dear Mockzinska,' said the princess, turning to her governess, 'go, I beg of you, and desire something to be brought here for this poor woman.'

'I am indeed very poor, and much to be pitied,' replied the beggar, whilst Mockzinska went away; 'but nevertheless I should not complain, madame, if I suffered alone.'

'You have children, then?' demanded Maria.

'Two, madame—a son and daughter. My son!—may God give him grace to walk in the right way! As to my daughter, she is dying.'

'Of what?' demanded the princess, her heart quite touched.

'Of want, madame. That is the sickness which kills most surely, and kills in the most cruel manner—slowly and hopelessly.'

'How shocking!' exclaimed the princess, clasping her hands. 'And how old is she?'

'The same age as our young king, Louis XV., madame,' replied the beggar. 'She was born on the same day as he, the 15th of February 1710. She was ten years old to-day.'

'And can anything be done for her, my good woman?' replied the princess. 'Perhaps good air and wholesome food?'

'Good air!—we live in a cellar. Wholesome food!—all we have to eat is the offal of the streets! and we have not even sufficient covering for her poor little body, which is quite blue with the cold.'

'Here—oh here, my good mother,' said the princess; and forgetting the porcelain, forgetting the romantic interest she attached to the louis-d'or, she put it into the hand of the old beggar. 'Here, this is all I have. Oh, poor creature, how you must suffer at seeing your daughter dying before your eyes!'

'Am I to have all this?' demanded the beggar, whom the sight of the gold now in her hand seemed to overwhelm with astonishment—'all this!'

'Alas! it is very little for so much wretchedness,' said the princess.

'Oh, my good princess!' exclaimed the beggar with a burst of gratitude, 'may God bless you—and he will bless you! You deserve to be queen of France!'

'Where do you live?' inquired the princess.

'At No. 3 of the old street of the Arcade,' said the poor woman.

At this moment Mockzinska returned, followed by a servant carrying something to eat, which he gave to the beggar.

'Will you permit me not to eat it myself?' demanded she.

'Just as you please. Take it where you like, and you may expect to see me to-day.'

The old woman did not need a second bidding, but went away, calling down the blessings of Heaven on the compassionate princess.

'Here is the porcelain, your highness,' said the voice of the pretended pedlar, who now reappeared.

'My good friend, I advise you to carry them to M. Levi. I have just disposed of my last louis-d'or,' said the princess.

So fierce an expression overspread the features of Mikael, that the princess recoiled almost in terror; but, in the unsuspecting goodness of her nature, she accounted for it by the thought that the destitution he had told her of must have rendered the disappointment a severe one; and she hastened to add, 'If you do not sell them to M. Levi, return to-morrow, and I will see what I can do.'

'I will return to-morrow!' said Mikael in a tone which almost sounded like a threat.

Mikael, as it may be supposed, carried the porcelain to no toy-merchant; so that the next day, at the appointed hour, he appeared at the castle, the asylum granted to the unfortunate king of Poland by the regent of France. This time, instead of the princess, he saw only a valet, who spoke gruffly to him, and did not waste much pains in softening his message.

'The princess neither can nor will buy your porcelain; so be off with yourself.'

'It is as bad for you as for me; for I intended to have shared the profits with you,' replied Mikael.

'On second thoughts, you may come back to-morrow,' said the valet, seduced by this unexpected offer. 'The princess has no money to-day, but to-morrow she will have some; for the Princess Palatine, her grandmother, fills her purse whenever she knows it is empty.'

The next day Mikael was again punctual at the same place. This time the princess had gone out, and was not to return till dinner-time. Mikael took up his basket, and again went away; but as he was gloomily crossing a street, which led out of the town, a neighbour accosted him.

'Mikael, how comes it that you have not been near your mother for the last three days?'

'I had something better to do,' answered Mikael gruffly.

'Oh, is that the way with you?' replied the neighbour. 'Well, if you wish to know what has been going on at home, go and see. Strange things. Enough; that is all I have to say to you.'

Though Mikael now eagerly called on him to explain himself, his neighbour went off whistling, and without seeming to hear him. These words: 'Strange things have been going on at home,' went to the heart of the youth. He thought it was some new misery; for, like all persons brought up in the school of misfortune, he anticipated nothing else. 'Was his mother ill? or had his sister sunk under the malady which had so long undermined her health?' And with every thought fixed upon them both—for the heart of Mikael was not yet so wholly corrupt as to be destitute of natural affection—he took the way to the city, and hastened to the abode of his mother.

It was the underground storey of a house, built in so

narrow a street, that the cheerful sunbeams could never find admission. As he set foot on the threshold of the house, a child playing near called out—'Mikael, your mother has removed. She lives now in the street opening upon the fields, down there, near the garden. Oh, it is so nice! Run, man, and see it!'

Astounded by this intelligence, which he could hardly understand, Mikael did not make up his mind to repair to the place pointed out to him by the child till perfectly assured that his mother no longer inhabited her old residence; and even then, he hesitated as he approached it, hardly believing that it was really the dwelling of his poor mother. Notwithstanding the snow which covered the ground, and hung from the shrubs like so many white and crystal tear-drops, the good order of the garden, and the beauty of the fruit-trees, were easily discernible. Then the house, small as it was, had an air of neatness and simplicity, the best substitute for elegance, and nearly as attractive. Suddenly he heard himself called.

'Well, Mikael, what are you doing there?' and a young child, still pale, but with eyes sparkling with happiness, appeared at the door.

It was his sister Louisa, who was so ill only three days ago, that she had to be supported while getting a drink, and now she was walking alone and unaided.

'Louisa!' exclaimed he, darting towards her, 'what miracle is this?'

'A miracle, indeed, dear Mikael,' replied the child; 'an angel has visited us. Wont you come in?' added she, drawing her brother into one division of the house, which served as a kitchen, and making him sit down by a good fire, on which a pot was boiling. 'Look, all this is ours—mamma's, and yours, and mine. All this has been given us by a young lady, who wept on seeing our old house, and said, "I could not have believed it possible that there was such wretchedness in the world." Yesterday she brought us here in a fine carriage, and we were expecting her again to-day, as she promised to come.'

'Oh, is that you, my son?' said an old woman, coming out of a neighbouring apartment. 'Louisa has told you all our happiness. But what have you there?' added she, pointing to the basket, which Mikael continued to hold in his hand.

'It is china, which has been given to me to sell,' replied Mikael.

'And that is what has kept you these three days from your mother, my son?' said she in that tone of tender reproach which, from the lips of a parent, is almost a caress.

Before Mikael had time to invent a falsehood, as probably he would have done, a carriage stopped at the door of the house, from which alighted a young girl, who ran across the garden with a step so light, that it scarcely left its trace upon the snow, and entering the kitchen, darted towards the fire. 'Oh, how cold it is!' said she. She was followed by an old lady, who also approached the fire, but without speaking. On the appearance of these two ladies, Mikael made a movement as if to run away; but the youngest having perceived him, prevented him by saying, 'Well, my little porcelain merchant, have you concluded your bargain with M. Levi?'

'No, madame,' replied he, stammering.

'What! princess, you know my son?' inquired the poor woman.

'What! this child of Poland is your son?' demanded in her turn the princess. Then seeing the confusion of the son, and the anger of the mother, the kind heart of the princess came to the aid of both.

'I guess it all, Mother Jalsen,' added she. 'You must forgive him, as I do. Nothing can excuse falsehood; but it may be some palliation of his, that he had recourse to it to get bread for you; and I suppose his story about his porcelain and M. Levi was like the rest. Well, I trust it may be a lesson to him; for if he had told me the truth, and had not led me to think that he had so cer-

tain a sale for them that my not buying them did him no injury—if he had but said to me, "My mother is dying of hunger, and my sister of disease," I should have given my louis-d'or to him as well as to you, Mother Jalsón; but I will say no more. So, then, your porcelain is not sold?" added Maria, observing the basket.

'Alas! no, madame,' said Mikael.

'My son!—my son!' cried Mother Jalsón sorrowfully; 'for some time you have not been steady; you keep bad company; you no longer work at the currier's with whom I placed you. What are you doing? where do you go to? and where did you get that porcelain, which I never saw before?'

'From a friend—from a real Pole,' said Mikael, with his eyes cast down; in his shame and embarrassment trying to avoid every eye.

'Then as your friend's position remains unaltered, he is still in want: is it not so?' demanded the princess.

'Yes, yes!' said Mikael.

'Fortunately I am just now rich enough to make many happy,' said Maria gaily. 'The Princess Palatine, my grandmother, having heard yesterday from the gossiping of my people, and a little also, I believe, from that of dear Mockzinska,' added Maria, smiling archly at her governess, 'how it fared with my poor purse, which I empty so often, has been good enough to fill it; so I can buy the porcelain of your Polish friend. At all events, I must have the snuff-box for my father,' continued the princess; and going to the basket, and uncovering it, she took out, one by one, the articles, and laid them on the table. 'I will give the bowl to the Princess Palatine, the six cups to my dear mother—'

'And what for yourself?' demanded Mockzinska.

'Oh, as to me, I shall be quite content if my father will give me a pinch of his good Spanish snuff.'

As she uttered these words, Maria had taken the snuff-box, opened it, and was putting it to her nose, when Mikael, who for some minutes had been uneasily watching every motion of the princess, darted towards her, and pale, palpitating, and as if beside himself, snatched it from her hands, and threw it into the fire. Then, as if terrified at what he had done, remained standing breathless and motionless.

'What can be the meaning of this?' cried in different tones each spectator of the scene. The princess alone said nothing. Indignant, but proudly calm, she sought to read, in his forehead and eye, the secret which made that scowling brow droop before her gaze.

'Speak, young man,' said Mockzinska to Mikael; 'what motive that we do not understand has led you to fail in respect to the daughter of the most unfortunate, as well as of the most virtuous of monarchs?'

'Are you mad, my son?' said the mother in a tone of deep sorrow.

'Brother,' murmured Louisa, 'it is the Princess Maria—the angel who cured me.'

'Speak, Mikael; I command you!' said Maria. There was such an energy of authority in the tone of the young girl, that Mikael fell on his knees, hid his face in his hands, and bursting into tears, cried, 'I am a wretch, a monster; I deserve death in all its torture. Whilst she was saving my mother, and curing my sister—whilst she was giving us health, joy, and happiness—I—I was carrying to her death and desolation!'

'Wretched boy! that snuff was poisoned, and you intended it for my father, and fixed upon my hands to offer it to him?' cried Maria, and she would have fallen, had not Mockzinska caught her in her arms.

'Oh! it cannot be—it cannot be!' exclaimed the poor mother in accents of despair.

'Answer, Mikael,' said Maria, regaining a little composure.

'It is too true!' said Mikael, still quailing under the fixed look of the princess.

'It is true!' repeated the princess, clasping her hands—'it is true you wished to kill my father! But who has incited you? Say—has this man, so just, unknowingly committed any act of injustice towards you? Has this

man, so noble, trampled upon you, because you are weak? Has this monarch, so unfortunate, visited upon you his misfortunes? Speak—speak, sir! How did my father ever wrong you?'

'Never, madame. But—oh! I ask not pity for myself—but for the sake of my mother, my young sister, hear me!' cried Mikael, throwing himself at the feet of Maria. 'The man who tempted me to do this dreadful deed, drove me almost mad by perpetually saying, "Whilst Stanislaus lives, your mother, your sister, and yourself will suffer cold and hunger."'

'Then who were these men?' demanded Maria, restraining her indignation in order to learn and defeat the plots of her father's enemies.

'I am quite ignorant of their names, their rank, or their number,' replied Mikael; 'but to-morrow I am to meet him who, for the last eight days, has been my evil genius, under the walls of the castle, outside the Gothic window of your royal father's room. You now know all I know myself, princess. As to asking your pardon, it is useless; my doom is fixed, my life is forfeited, sold either way.'

'Fear not; I take you under my protection; no harm shall happen you,' said the princess. 'But I must return to the castle. My father, my good father, so noble, so good, so virtuous! Oh, may a gracious Providence bestow on you the reward of your virtues!'

'He has already bestowed it on him, in giving you to him, dear princess,' said Mother Jalsón weeping. 'Have you not already been his preserver by the very act of loading us with benefits?'

'I have indeed been rewarded for what I have been able to do for you,' said the princess, wiping her beautiful eyes, still wet with tears. 'Oh let us hasten back to the castle, Mockzinska; after the danger my father has been in, I long as much to see him as if we had been parted for years.'

Thus the life of Stanislaus was once more saved; I say once more, because this was the third plot to assassinate him. The first attempt was by a barber, who, having undertaken to kill him, ran away, leaving the king with the napkin round his neck, and his face covered with lather; the second was defeated by a plot still more artfully contrived; and this third and last was the forerunner of an event overwhelming the family of Stanislaus with joy.

The treaty of marriage between Louis XV. and the infanta of Spain having been broken off, the ministers of the boy-king sought everywhere for the princess most likely to render Louis happy; and after some consideration, they decided on Maria Leszcinska.

Stanislaus still inherited Weissemburg, when proposals for her hand were made to him through the Cardinal de Rohan, bishop of Strasburg. He repaired immediately to the chamber of his wife, who was employed at needlework.

'Let us kneel down and thank God,' said he as he entered.

'Father!' exclaimed Maria, 'you are reinstated on the throne of Poland?'

'Oh, my daughter!' replied the dethroned king, 'Heaven has been much more propitious to us—for you are queen of France!'

The nuptials were celebrated at Fontainebleau on the 5th of September 1725.

She had scarcely been six months on the throne, when she wrote thus to her father:—'I hope, my dear papa, that you will not keep me waiting longer for what you promised. Mark out clearly all my duties for me: tell me all my faults. You know me better than I know myself. Be my guiding angel. I am indeed sure that by following you I shall never go astray; but I cannot answer for what I may do if I depend only upon my own poor understanding. It seems as if everybody was pleased with me. I do not judge by what is spoken, for that is but flattery; but it seems as if every face was lit up with joy at my approach, and that gives me pleasure. Praise be to our gracious God for all! My dear

papa, I am sure you will pray to Him for the king and me.

MARIA.

Her father hastened to send her the advice she had solicited, and which was dictated by the most rational tenderness and the most enlightened wisdom; and by conforming to it, she acquired amongst her French people the title of the 'Good Queen.' It is pleasing to add that Stanislaus, on abdicating his claim to the throne of Poland in 1736, obtained the duchies of Lorraine and Bar, where, till his death, he reigned in the affections of the people as 'Stanislaus the Beneficent.'

EDUCATION OF IDIOTS AT THE BICÊTRE.

THIRD ARTICLE.

AFTER the school exercise, described in a former article,* the boys were desired to disperse, and proceed to their various occupations. They broke up in a manner very similar to boys in an ordinary school; some capering off with all the glee of liberty, others sauntering out singly or in company with their fellows, and a few voluntarily remaining in the school-room. I was conducted by M. Vallée into an adjoining apartment, where were arranged against the wall a variety of maps, and a number of coloured engravings, calculated to afford both amusement and instruction. During the few minutes we remained in this room, several of the idiots came romping and scampering together into it, showing much more spirit, and a greater capacity for playful enjoyment, than I could have supposed them capable of. Three or four of them immediately sprang on a large rocking-horse, which stood in the centre of the room, and began to force it backwards and forwards with no small amount of pleasure to themselves, as shown by their repeated joyous shouts and boisterous laughter. I was told that they entered with equal zest into the various games practised every evening, such as leap-frog, skipping-rope, marbles, ball, &c.

As we stood in this anteroom, I could observe the troop of little fellows wending their way to the scene of their different occupations. After watching them a little while, we left the school-room, and proceeded to follow them, with a view of witnessing their proficiency in the various handicrafts in which they had been instructed.

On passing into the open air, I became fully sensible of the crowd of novel impressions which had in so short a space of time been made upon me, and I felt tempted to pause and look back on the spot where so many new ideas had been received, and with which I now associated a strong feeling of interest.

In taking a rapid review of what had been already demonstrated before me, I endeavoured to systematise and fix in my own mind the principles which had been employed in producing such happy results. It became evident that the various senses are, first of all, stimulated and brought into activity, and through their medium a certain amount of mental power generated. The pupils are next made acquainted, as far as it is possible, with natural objects, and such more especially as come within the range of their ordinary observation. By these familiar lessons in the simplest elements of knowledge, instruction is conveyed in a form well suited to their feeble comprehension; and the method of imparting it being both natural and easy, its attainment is rendered attractive and interesting. Some acquaintance with the nature and properties of objects having been communicated, attempts are next made to impart instruction in the higher branches of knowledge. This is accomplished by means of various mental exercises, so ordered, that the pupil is led gradually, and almost imperceptibly, from the simplest to the higher departments of education. Then easy gradations in the successive lessons appear to have the effect not only of communicating information in an admirable manner,

but also of preventing any sensations of irksomeness or weariness from arising in the minds of the pupils. It is not difficult to imagine the delight which many of these youths experience at the time the first rays of intelligence are engendered within them. Having lived several years in a senseless, inactive condition, it is easy to conceive that the change from this state of vacuity to an existence conscious and intelligent, must be accompanied with feelings of peculiar pleasure and novelty.

In the whole of these exercises, it was evident that a variety of influences were brought into play for the purpose of arousing and keeping in a state of activity the attention of the pupils. Such, for instance, as the concerted and simultaneous movements of the whole pupils; instruction conveyed in the collective and individual mode; and again not only imparted, but elicited by interrogation. Each lesson was illustrated in a manner well suited to their feeble comprehension; and by making these illustrations as pleasing as possible, as well as by interspersing them judiciously, the liability to lapse into a state of vacuity was prevented, at the same time that the feeble powers of attention were not overstrained.

It was pleasing to observe that, in conducting this course of training, the principle of fear seemed in no respect to form a part of the system. There was no appearance of coercion, harshness, or even exaction. The pupils appeared to be encouraged, assisted, and, by mild and persuasive means, to be led gently onward in the path of knowledge by their excellent conductor; who, endowed with a courteous spirit, kind disposition, much method, address, and competent skill, seemed admirably adapted to make their lessons attractive, by blending instruction with sportive influences. The affectionate regard in which the pupils evidently held their teacher spoke favourably not only of his personal good qualities, but also of the excellence of the system. Indeed the essential feature throughout the whole economy seemed to consist of a loving interest and regard for each other, both on the part of tutor and pupils.

The first workroom we entered was that of the carpenters. There were in it fifteen idiots, superintended by two journeymen, who both instructed and encouraged them by working with spirit and activity. Although a short time only had elapsed since we quitted the school-room, yet some of the youths were already employed, others were looking up their tools or adjusting their aprons preparatory to beginning their work. Near the door stood one, who, when I first saw him (early in the day, before any of the exercises had been undertaken), struck me as a most deplorable hopeless object, and I accordingly singled him out for especial observation. In the school-room he had manifested considerable progress in writing, drawing mathematical figures, and other exercises. As I looked towards him, he made evident though very awkward and uncouth signs of recognition, then approached the place where I was standing, and presented to my notice a small ornamental clasp, with which he was about to attach a portion of his working-dress when I entered the room. After looking for a short time at this little ornament, which he seemed to admire and treasure, I returned it to him, when he at once proceeded to adjust his working costume, and fix it with his little clasp. He then began his work by taking up a piece of wood which it was his business to plane. After looking at it a moment or two, he placed it in a vice, screwed it firmly, and commenced turning off the shavings in a workmanlike manner. As if conscious of his merit, he every now and then paused, looked up, and seemed pleased with his own proficiency, and encouraged by the approval awarded to him by his superiors.

This youth is sixteen years of age, and has been in the Bicêtre rather more than three years. When first admitted, he manifested all the characteristics of an inferior animal. His appetite was voracious, and he would devour the most disgusting things. He exhibited,

* Journal, No. 161.

indeed, some traces of a love of approbation, together with signs of an instinctive gaiety, born, as it were, within, and not created by surrounding objects; but he had all the sensuality of a brute, and a vicious propensity to tear and destroy whatever came within his reach. He was, moreover, passionate in the extreme, attacking and biting every one who offered the least opposition to his inordinate and disgusting propensities. Among these was a very singular one—namely, a strong impulse to poke out the eyes of all who came within his reach. He also showed a peculiar desire to strike any sonorous substance, so as to produce a distinct sound. The voluntary power over his muscles was very imperfect, and he could neither walk nor run properly; he would, however, sometimes spring forward like a wild animal, and at other times he would suddenly start off from his companions, making at the same time a shrill unmeaning cry.

This being, who in 1843 had been in so strange and apparently hopeless a condition, could now read, write, sing, and calculate. I had already noticed in him several manifestations of attachment, and other moral qualities. I now saw him happily engaged, making good use of implements with which, if placed in his hands a few years ago, he would doubtless have inflicted serious injury.

On looking around the room, nearly all the youths were seen to be engaged in sawing, planing, filing, and joining together pieces of wood. The busy scene presented was equally interesting, whether viewed as a whole, or whether the attention was directed to a single pupil. I was struck with the apparent steadiness of hand with which the various tools were grasped and used, as well as with the judgment which was evidently exercised during the performance of the work. I was the more struck with this when I singled out one from the number, and closely observed him to place his piece of timber in the vice, screw it down, take up his plane, and use it for a while, then remove and examine his work in hand; and finding he had not reduced it sufficiently, return it to the vice again, and proceed as before. Selecting another pupil for individual observation, he was seen busily engaged with a small piece of hardwood, forming it, by means of a file, into a sort of moulding of a complicated figure, consisting of curved and straight surfaces, the boundaries of which had been previously marked on it in dark lines.

The order, exactness, and workmanlike manner in which these operations were carried on, was both surprising and gratifying. Before leaving the room, I paused to make a general and accurate examination of the proceedings of these little fellows, with whom I had already formed a sort of acquaintanceship in the school-room. I observed that those who, when handling a slight rule and piece of chalk, seemed to have only a very imperfect control over the arm and hand, were enabled, when engaged in operations requiring greater muscular power in grasping and overcoming resisting objects, to exercise a steadiness and precision which could scarcely have been expected. This circumstance, though at first sight an apparent anomaly, will yet be found, if duly considered, in accordance with certain conditions of the muscular organisation which are known to attend some morbid states of the nervous system, the elucidation of which, however, would at the present moment lead us too far away from the immediate and practical object to which we desire to confine the attention of our readers. Having made this slight digression, I take leave to pause, for the purpose of introducing a passing reflection concerning the instructions which had been given to the idiots in mathematical drawing. At the time that I observed them describing, in a masterly manner, complex figures with chalk, compass, and rule, I was inclined to entertain the idea that such exercises were introduced to show the extent to which an idiot could be educated. I was somewhat fearful they might be looked upon as evidences of what could be done, rather than what ought to be attempted,

and that they bore a character of display and effect, more than one of true utility. These hasty and unjust suspicions received a salutary check as soon as I had been a short time in the midst of this little band of carpenters; and before I left the room, they were not only entirely removed, but I had become impressed with the importance of such preparatory exercises, as a means of giving to these defective creatures a capacity to enter on various trades, by making them capable of appreciating the relation of lines to one another, and the various distinctions between obtuse, acute, and right angles.

After dwelling some time in the carpenters' shop, I was conducted to the next room, where an equally busy and gratifying spectacle was presented. In the apartment we had now entered were no less than twelve idiots, who had been instructed in the art of shoemaking. They were superintended by one foreman, who cut out and fixed the work for them. Each little fellow was seated at a separate stall, and beside him were laid the various implements required in his trade. The whole of the boys were working away very busily, boring with the awl, stitching, hammering, and smoothing down in a remarkably brisk and workmanlike manner.

If the scene in the adjoining room afforded me much pleasure, the sight of the proceedings in this was calculated to heighten such feelings in no small degree. Conscious, from experience, of the difficulty which exists in instructing persons of feeble understanding in an art so complicated as that of shoemaking, I exulted at the spectacle presented, and regarded it as a triumph, and conclusive demonstration of the excellence of the system pursued in training these poor idiots. Step by step I had enjoyed the opportunity of witnessing the means adopted to rescue and elevate these forsaken members of the human family, and I now saw them happy and usefully engaged in the successful execution of work requiring the command of an ordinary share of mental endowment. Although familiar with the internal economy of many of our excellent institutions at home, and no stranger to the condition of several equally excellent in various parts of the continent, yet I confess I never experienced, whilst visiting them, a glow of satisfaction and delight at all to be compared with that which was caused by the sight presented in this little workroom.

Among the workers in this room was the poor decrepit fellow whose condition had previously attracted my especial attention. He was engaged in making list slippers, several pairs of which lay near him. The regularity and steadiness with which he laid the edgings of cloth on his last showed that considerable nicety, comprehension, and capability had been imparted to this apparently hopeless object. He proceeded with his work, as I stood by him, fixing each successive layer by means of a small nail, which he gently struck with his hammer; from time to time he would look up inquiringly, then go on again, as if satisfied that his work met the approbation of the bystanders. It was not without some difficulty I could abstract my attention from this attractive spectacle; and when I retired towards the door, still regarding these poor fellows with interest, one of them rose from his seat, approached, and wished me 'Good-day.' As I walked away from the workshop, dwelling on the scene I had just witnessed, and of this act of courtesy when leaving it, I felt in the humour to indulge my fancy by thinking of the many sources of pleasure and enjoyment in store for these, the most abject and neglected of our fellow-creatures.

The remainder of the youths—those who are not instructed in any handicraft—are employed in agricultural operations on the farm of St Ann, which lies a short distance from the Bicêtre, and which was purchased a little while ago for the purpose of affording to the insane inmates the opportunity of engaging in this very suitable occupation. Most of the pupils had already proceeded to the farm when I came away from the workshops; I had, however, the opportunity of observing the last detachment prepare for work, by collecting their spades in the implement-room, and proceeding in an orderly

manner under the care and direction of a farm-labourer. The system adopted in this department is marked by that discretion which is so signally conspicuous in every other arrangement. A number of husbandmen are engaged to instruct, superintend, and work with the boys; each man having a certain number placed under his charge. He is provided with a list of their names, and before setting out, he calls over the roll, each pupil answering to his name, and stepping forward at the same time with his spade in his hand. Before setting out, they, at the word of command, arrange themselves in rank and file, shoulder their long, small spades, and march away in military order. On these minor arrangements depends no doubt much of the excellence of the system, both in preserving order, keeping alive attention, and the prevention of the waywardness peculiar to idiots.

I have already spoken of the improved expression which was observed to spread over the countenance at the time the feeble mental faculties were called into action by means of the exercises in the school-room. In the workshops a similar agreeable change might be noticed during the time the youths were employed, when the features had in a great measure lost their wonted vacuity, and assumed an appearance of intelligence and comprehension probably in a higher degree than that observed in the school-room.

Having now completed the description of my first visit to the Bicêtre, I think it right to say, that as no notice had been given of my intention to inspect the institution, I have every reason to believe that what I witnessed was nothing more than the ordinary daily routine.

INGOLDSBY AND HIS LEGENDS.

MUCH more attention than usually falls to the lot of magazine articles was arrested by a series of comic poems called 'The Ingoldsby Legends,' which appeared a few years ago in Bentley's Miscellany. Mirth-raising in their narrative effect, they were marked by a singular aptness on the part of the author for the adroit use of the cant language of the day, and the management of out-of-the-way metres and rhymes. Some other features there were, indicating a genius of no common stamp; one disrespectful, it might be said, to many of the common proprieties of literature and the world, but which more than made up for everything by such an exuberance of drollery, as perhaps is not to be obtained upon other terms, and is almost worth having upon any. In time, it became known that the Thomas Ingoldsby set forward as the author of these legends, was no other than the Rev. R. H. Barham, one of the clergy of St Paul's Cathedral; a man of the most perfect respectability in his ordinary character, at the same time that, from his cheerful and amiable dispositions, he was the delight of his family and friends. A long life was not vouchsafed to this estimable person; he died in June 1845, at the age of fifty-seven: and his son has now published an ample memoir of his life, prefacing a third collected series of his 'Legends.'

The personal history of Mr Barham embraces little more than his clerical education, and his various translations from parish to parish. It is agreeable, however, to learn respecting a person of such gaiety of nature, that he was a discreet and conscientious pastor, always in the best esteem both with his superiors and his flock. He had a strong turn for antiquities and old literature, as appears pretty plainly in his poems. He was also a man of sincere but modest piety; he had had severe trials, and he bore them well. We have

much pleasure in recalling a meeting we had with him some years before he was known as an author. We encountered each other amidst one of the miscellanies of company which used to gather at the board of the late Owen Rees the bookseller. Probably finding some common ground in antiquarian subjects, we advanced so far in acquaintance, that Mr Barham offered very kindly to conduct us next morning to some of the more *recherché* parts of the neighbouring cathedral. A favour of so unusual a kind in the busy life of London, had the effect of stamping the image of the man upon our memory, and we now recall it with pleasure. He was of middle size, somewhat thick, with a round good-humoured face, but not the air of an intellectual man. We remember setting down the head as non-indicative of literary talent; yet it now appears to us, on reconsidering it, with the benefit of portraits, that the forehead was of a peculiar depressed and square form, which we have remarked in several other men of comical genius.

Mr Barham's biographer informs us that the legends were chiefly concocted from stories picked up in conversation: many of the anecdotes on which they are founded had been related to the poet by his friend Mrs Hughes, wife of another of the St Paul's clergymen. The biographer says, 'As respects the poems, remarkable as they have been pronounced for the wit and humour which they display, their distinguishing attraction lies in the almost unparalleled flow and facility of the versification. Popular phrases, sentences the most prosaic, even the cramped technicalities of legal diction, and snatches from well-nigh every language, are wrought in with an apparent absence of all art and effort that surprises, pleases, and convulses the reader at every turn; the author triumphs with a master's hand over every variety of stanza, however complicated or exacting; not a word seems out of place, not an expression forced; syllables the most intractable find the only partners fitted for them throughout the range of language, and couple together as naturally as those kindred spirits which poets tell us were created pairs, and dispersed in space to seek out their particular mates.' All this is eminently true. See, for example, his description of Henry II. of England, where he speaks of the king and his hat in these terms—

'With a great sprig of broom, which he wore as a badge in it,
Named from this circumstance, Henry Plantagenet.'

Or the passage where he acknowledges

'A metaphor taken—I've not the page aright—
Out of an ethical work by the Stagyrte.'

Or, as a dernier, the following—

'Re-cul-ver, some style it,
While others revile it
As bad, and say Re-cul-ver. 'Tisn't worth while, it
Would seem to dispute, when we know the result immat-
erial—I accent, myself, the penultimate.'

As an example of his humour and his rhymes together, a few verses may be presented from a long leash, in which he describes himself sitting down for a day to answer an accumulation of letters:—

'First, here's a card from Mrs Grimes,
"A ball!"—she knows that I'm no dancer—
That woman's asked me fifty times,
And yet I never send an answer.'

"DEAR JACK—

Just lend me twenty pounds
Till Monday next, when I'll return it.

Yours truly,

HENRY GIBBS."

Why, Z—ds!

I've seen the man but twice—here, burn it. * *

* The Ingoldsby Legends, or Mirth and Marvels, by Thomas Ingoldsby, Esq. Third Series. London: Bentley: 1847. Pp. 364.

From Seraphina Price—"At two—
Till then I can't, my dearest John, stir ;"
Two more because I did not go,
Beginning "Wretch" and "faithless monster !"

"DEAR SIR—

This morning Mrs P—,
Who's doing quite as well as may be,
Presented me at half-past three
Precisely with another baby.

We'll name it John, and know with pleasure
You'll stand"—Five guineas more, confound it !—
I wish they'd called it Nebuchadnezzar,
Or thrown it in the Thames, and drowned it.

What have we next ? A civil dun :
"John Brown would take it as a favour"—
Another, and a surlier one,
"I can't put up with *sich* behaviour."

"Bill so long standing"—"quite tired out"—
"Must sit down to insist on payment"—
"Called ten times." Here's a fuss about
A few coats, waistcoats, and small raiment !

For once I'll send an answer, and in-
form Mr Snip he needn't "call" so ;
But when his bill's as tired of "standing"
As he is, beg 'twill "sit down also."

This from my rich old Uncle Ned,
Thanking me for my annual present ;
And saying he last Tuesday wed
His cook-maid Molly—vastly pleasant ! * *

Four begging letters with petitions,
One from my sister Jane, to pray
I'll "execute a few commissions"
In Bond Street, "when I go that way."

And buy at Peasall's in the City,
Twelve skeins of silk for netting purses
Colour, no matter, so it's pretty ;
Two hundred pence—"two hundred curses !"

From Mistress Jones : "My little Billy
Goes up his schooling to begin,
Will you just step to Piccadilly,
And meet him when the coach comes in ?

And then, perhaps, you will as well see
The poor dear fellow safe to school
At Dr Smith's, in little Chelsea !"
Heaven send he flog the little fool ! * *

The memoir abounds in racy anecdotes, some of which are extracted from letters and diaries of Mr Barham. He tells several curious ones with regard to a strange custom of the rude peasantry of Kent, who, meaning nothing but kindness, would use means to accelerate the exit of such friends as were dying hard. A man, stretched on a deathbed of game feathers, which are supposed to be unfavourable to easy death, seemed as if he never *would* go—so, said his wife, 'We pulled bed away, and then I just pinched his poor nose tight with one hand, and shut his mouth close with the t'other, and, poor dear ! he went off like a lamb !' Another woman told with great complacency how, when her child's case had been pronounced hopeless, and seeing nothing would ease him, 'we was forced to *squidge* him under the blankets.' These facts are new to us, and they give additional credibility to what we long ago heard regarding the Shetland peasantry of past times, upon apparently good authority. It was stated that in this northern region, when dying persons lingered long, and particularly when they appeared in pain, it was customary to lay a pillow gently over their mouths, by way of closing the scene. On some enlightened person remonstrating with horror against the custom, the people said—'Oh, sir, we only help God awa wi' them !' What would have been barbarity and profanity in others, was in them mere simplicity.

One of Mr Barham's table stories, which we propose to quote, is said to have been picked up from an old London citizen, who was full of 'marvellous instances of judicial acumen displayed by forgotten lord mayors—bon mots of their chief clerks—perilous swan-hopping voyages, and extraordinary white baitings.' 'An old

London gentleman, a merchant in Bush Lane, had an only daughter, possessed of the highest attractions, moral, personal, and pecuniary ; she was engaged, and devotedly attached, to a young man in her own rank of life, and in every respect well worthy of her choice ; all preliminaries were arranged, and the marriage, after two or three postponements, was fixed, "positively for the last time of marrying," to take place on Thursday, April 15, 18—.

'On the preceding Monday, the bridegroom elect (who was to have received L.10,000 down on his wedding-day, and a further sum of L.30,000 on his father-in-law's dying, as there was hope he soon would) had some little jealous squabbling with his intended at an evening party ; the "tiff" arose in consequence of his paying more attention than she thought justifiable to a young lady with sparkling een and inimitable ringlets. The gentleman retorted, and spoke slightly of a certain cousin, whose waistcoat was the admiration of the assembly, and which, it was hinted darkly, had been embrodered by the fair hand of the heiress in question. He added, in conclusion, that it would be time enough for him to be schooled when they were married ; that (reader, pardon the unavoidable expression !) she was *putting on the breeches* "a little too soon !"

'After supper, both the lovers had become more cool ; iced champagne and cold chicken had done their work, and leave was taken by the bridegroom *in posse*, in kindly and affectionate, if not in such enthusiastic terms, as had previously terminated their meetings.

'On the next morning the swain thought with some remorse on the angry feeling he had exhibited, and the cutting sarcasm with which he had given it vent ; and, as a part of his *amende honorable*, packed up with great care a magnificent satin dress, which he had previously bespoken for his beloved, and which had been sent home to him in the interval, and transmitted to the lady, with a note to the following effect :—

"DEAREST * * *—I have been unable to close my eyes all night, in consequence of thinking on our foolish misunderstanding last evening. Pray, pardon me ; and, in token of your forgiveness, deign to accept the accompanying dress, and wear it for the sake of your ever affectionate * * *

'Having written the note, he gave it to his shopman to deliver with the parcel ; but as a pair of his nether garments happened at the time to stand in need of repairing, he availed himself of the opportunity offered by his servant having to pass the tailor's shop in his way to Bush Lane, and desired him to leave them, packed in another parcel, on his road.

'The reader foresees the inevitable *contretemps*. Yes, the man made the fatal blunder !—consigned the satin robes to Mr Snip, and left the note, together with the dilapidated habiliment, at the residence of the lady. Her indignation was neither to be described nor appeased : so exasperated was she at what she considered a determined and deliberate affront, that when her admirer called, she ordered the door to be closed in his face, refused to listen to any explanation, and resolutely broke off the match. Before many weeks had elapsed, means were found to make her acquainted with the history of the objectionable present ; but she, nevertheless, adhered firmly to her resolve, deeply lamenting the misadventure, but determined not to let the burden of the ridicule rest upon her.'

Mr Barham was a zealous conservative, and occasionally employed his wit in behalf of his party, but always with good humour. We mention the circumstance, merely to introduce a bit of irresistible drollery from a letter in which he adverted to the West Kent election. 'What amused me very much was, that on landing from the steamboat at Gravesend, where my vote was to be taken, the rain was falling pretty steadily, and every one of the passengers who boasted an umbrella of course had it in play. A strong detachment of the friends of all the candidates lined the pier, to see us

come on shore, and loud cheers from either party arose as any one mounted the steps bearing their respective colours. With that modesty which is one of my distinguishing characteristics, I had endeavoured to decline the honour of a dead cat at my head, with which I was favoured on a previous occasion, by mounting no colours at all; but something *distingue* in my appearance, as self-complacency fondly whispered in my ear, made the Tory party roar out as I mounted the platform—

"Here comes von o' hour side!"

"You be blowed!" said a broad-faced gentleman in sky-blue ribbons; "I say he's our'n."

"Be blowed yourself," quoth one of my discriminating friends opposite. "Why, don't you see the gemman's got a *silk umbrella*?"

"The conclusion was irresistible. Tory I must be; and the "*I know'd it!*" which responded to my "Geary for ever!" was truly delicious."

A memoir of some two hundred pages, spangled all over with droll things of this kind, would furnish of course matter for an extended article. Our object, however, being strictly to present a mere sketch of the stuff it is made of, we content ourselves with the following specimen of the stories which made the after-dinner conversation of Mathews so attractive. The author justly remarks what ample room it would afford for the development of his peculiar powers of impersonation:—

"An Irish surgeon, named M——, who kept a running horse, applied to him on one occasion for his opinion respecting a disputed race.

"Now, sur," commenced the gentleman, "Mr Mathews, as you say you understand horse-racing, and so you do, I'll just thank ye to give me a little bit of an opinion, the least taste in life of one. Now, you'll mind me, sur, my horse had won the first *hate*; well, sur, and then he'd won the second *hate*; well——"

"Why, sir," said Mathews, "if he won both the heats, he won the race."

"Not at all, my dear fellow; not at all. You see he won the first *hate*, and then, somehow, my horse fell down, and then the horse (that's not himself, but the other) came up."

"And passed him, I suppose?" said Mathews.

"Not at all, sur; not at all: you quite mistake the gist of the matter. Now, you see, my horse had lost the first *hate*."

"Won it, you mean; at least won it you said."

"Won it!—of course I said won it: that is, the other horse won it: and the other horse, that is, *my* horse, won the second *hate*, when another, not himself, comes up and tumbles down. But stop! I'll demonstrate the circumstance ocularly. There, you'll keep your eye on that decanter; now, mighty well—now you'll remember that's *my* horse; that is, I mane it's not *my* horse, it's the other; and this cork—you observe this cork?—this cork's *my* horse; and *my* horse—that is, this cork—had won the first *hate*."

"Lost it, you said, sir, just now," groaned Mathews, rapidly approaching a state of complete bewilderment.

"Lost it, sur! By no means; won it, sur, I maintain (pon my soul, your friend* there that's grinning so is a mighty bad specimen of an American); no, sur, *won* it, I said. And now I want your opinion about the *hate*; that is, not the *hate*, but the race, you know—not, that is, the first *hate*, but the second *hate*—that would be the race when it was won."

"Why, really, my dear sir," replied the referee, "I don't precisely see the point upon which——"

"God bless me, sur! do ye pretend to understand horse-racing, and can't give a plain opinion on a simple matter of *hates*? Now, sur, I'll explain it once more. The stopper, you are aware, is *my* horse, but the other horse—that is, the other *man's* horse," &c. &c.

* And so on poor M—— went for more than an hour,

and no one could tell at last which horse it was that fell; whether he had won the first *hate* or lost it; whether his horse was the decanter or the cork; or what the point was upon which Mr M—— wanted an opinion."

NATURAL HISTORY.

FOR THE YOUNG.

THE study of natural objects is now almost universally allowed to be one peculiarly suited to youth—to that period, as Burke observes, 'when the senses are un worn and tender, when the whole being is exquisitely alive, and the glow of novelty is fresh upon all the objects which surround us.' Yet though all this is abundantly evident, it is singular enough that the regular introduction of natural science into our educational seminaries in this country is as yet but of rare occurrence. The period from five to fifteen—that period which is usually devoted to elementary training—is that in which the mind has the greatest avidity for facts and phenomena. It is pleasing at this period to see how the mind grasps at every kind of information regarding physical objects—how it delights in tracing analogies—forming combinations—and arranging and methodising into systems—how, in short, the ideas of beauty, order, fitness, and harmonious congruity take possession of the mind. The young and eager intellect at this period finds such studies peculiarly suited for its powers; there is nothing too deep for its comprehension—nothing too abstract, or too much beyond the calibre of its as yet immature and not fully developed powers. But if this golden opportunity be allowed to elapse, the mental appetite will seek other and more grovelling gratifications: the pleasures, the dissipations, the business of the world, will absorb all the attention; or if other studies are persevered in, they engross and occupy the whole mind, so that rarely, indeed, do we find a love of natural science cultivated in mature life, unless it has been implanted at an early period.

Our continental neighbours seem more alive to these branches of early instruction than we are. There, botany, zoology, and geology are regularly taught in their elementary schools, and their connexion with geography, history, and the arts of life fully demonstrated. To some extent these studies are gradually being introduced into our most approved seminaries in this country, though in a very small number, indeed, have they become regular branches of educational training. They are as yet only timidly introduced as extra and optional studies; encroaching sometimes on the hours appropriated to relaxation, or given so shortly, and at such long intervals, as to fail to make any due impression on the minds of the pupils. We hope, however, yet to see them introduced as indispensable branches of education, with competent teachers, into all our leading institutions throughout the kingdom. In a great commercial and agricultural community such as ours, the elements of natural science, in all its departments, ought surely to be within the reach of every individual, however humble the calling to which he may be destined.

In our richly-endowed educational hospitals, where we occasionally hear of listlessness and insubordination on the part of the pupils, such studies might doubtless be introduced with the best advantage. We know nothing more likely to engage the youthful mind there, both innocently and advantageously, or more calculated to supply the absence of the domestic circle, and all the home feelings, of which they are necessarily deprived.

A little work on zoology,* intended as a text-book for school tuition, has prompted to the repetition of these remarks. It is the first part of a history of animal life, commencing at the lowest end of the scale, and including the invertebrate animals. It is not merely a common compilation, but exhibits the spirit and originality

* Stephen Price, the manager of Drury Lane theatre.

* Introduction to Zoology: for the Use of Schools. By R. Patterson. Belfast: Simms and McIntyre. 1846.

of a mind evidently well stored with accurate facts, and enthusiastic in the admiration of the works of nature. Its illustrations are numerous, and consist of the woodcuts of Milne Edwards's French work on the same subject. Next to the actual objects themselves, good illustrations are indispensable to the student of natural history.

During the past season, an unusual number of those jelly-looking creatures called medusæ, or sea-nettles, have swarmed along our shores. They are amongst the simplest and lowest of the scale of animated beings, and are thus described:—

'There is much in the structure of these creatures to excite our surprise. Their frail and gelatinous bodies seem little else than a mass of vivified sea-water, or some analogous fluid. "For," says Professor Owen, "let this fluid part of a large medusa, which may weigh two pounds when recently removed from the sea, drain from the solid parts of the body, and these, when dried, will be represented by a thin film of membrane, not exceeding thirty grains in weight." They baffle the skill of the anatomist by the very simplicity of their structure. Feeble as they appear, fishes and crustacea are quickly dissolved in their stomachs. The organism of their stinging power is yet but imperfectly understood, and the luminosity which many species possess, equally demands investigation. They are found in all seas, and please the eye both by their glassy transparency and by their brilliant hues. Some are furnished with a central peduncle, and resemble a mushroom with its stalk; others have its place supplied by prehensile arms: some have one simple central mouth; in others both its structure and position are different: in some the margin is furnished with long contractile tentacula, whence the well-known stinging secretion is supplied; in others this formidable apparatus is altogether wanting. These differences, which are easily observable, enable the naturalist to classify the gelatinous medusæ, for such is their collective appellation. Their locomotion is effected by the contraction and expansion of the outer margin of the disc, the animal striking the water in the opposite direction to that in which it is moving. The motion is easy and graceful, admitting of progress in any direction. The lower surface of the disc is covered with a delicate network of vessels, in which the circulating fluids are exposed to the oxygen contained in the sea-water. Each contraction of the margin, therefore, not only impels the animal in its course, but assists in the process of respiration.

'The medusæ differ extremely in size. Some are occasionally thrown upon our coast which are as large as a good-sized umbrella; many are not larger than peas; and some scarcely exceed in dimensions the head of a large-sized pin. Some species are adorned with brilliant colours, and equal in the richness of their hues the brightest of our garden flowers. When from a small boat, in a glassy and transparent sea, they are beheld rising and falling at pleasure, and occasionally turning over in the apparent exuberance of enjoyment, they form objects of contemplation so very attractive, as to excite the astonishment of the child, while they furnish matter for the contemplation of the naturalist.

'The species of medusa most abundant on our coasts during the early part of the summer (*Cyanea aurita*), is well known by the four conspicuous lunar or heart-shaped figures which it exhibits. These are of a pinkish or purplish colour, and are, in fact, the ovaries. Four pouches are observed on the lower surface of the body. To these the young, at a certain period, are transferred from the ovaries, and undergo a species of development analogous to that of the young quadrupeds of Australia in the marsupial pouch of the mother. After changes in their size and colour, they exhibit a change of form, become clothed with vibratile cilia, and leaving the maternal pouch, swim freely about, the larger extremity being always in advance. The little creature soon attaches itself to some fixed object, and four arms appear, surrounding a central mouth. The arms

lengthen, four additional ones are developed, all are highly contractile, covered with cilia, and actively employed in the capture of food. The number of these arms increases until it reaches twenty-four or thirty; and the body, originally about the size of a grain of sand, becomes a line, or the twelfth part of an inch in length. During the winter months, it remains in security "where the waves have no strife," and even throws out germs or buds, which in time become perfect medusæ. But with the approach of spring, the body becomes marked with transverse lines, which gradually assume a wrinkled or furrowed appearance. These furrows become deeper, dividing the body into from ten to fifteen distinct portions, which for a time remain in contact, but without organic connexion, "like piled-up cups." After complete separation, each part swims freely about, presenting an appearance so unique, that the young in this state has been figured and described as belonging to a new genus. The last change observable is its putting on the appearance of the perfect animal, and under the influence of the sun, the waves, and the currents, becoming a mature medusa. "We thus see," says Professor Owen, "that a medusa may actually be generated three successive times, and by as many distinct modes of generation—by fertile ova, by gemmation, and by spontaneous fission—before attaining its mature condition."

'With regard to the medusæ, we may mention an anecdote which we learned from an eminent zoologist [E. Forbes], now a professor in one of the English universities. He had, a few years ago, been delivering some zoological lectures in a seaport town in Scotland [St Andrews], in the course of which he had adverted to some of the most remarkable points in the economy of the aculephæ. After the lecture, a farmer who had been present came forward and inquired if he had understood him correctly, as having stated that the medusæ contained so little of solid material, that they might be regarded as little else than a mass of animated sea-water? On being answered in the affirmative, he remarked that it would have saved him many a pound had he known that sooner, for he had been in the habit of employing his men and horses in carting away large quantities of jelly-fish from the shore, and using them as manure on his farm, and he now believed they could have been of little more real use than an equal weight of sea-water. Assuming that so much as one ton weight of medusæ, recently thrown on the beach, had been carted away in one load, it will be found that, according to the experiments already mentioned, the entire quantity of solid material would be only about four pounds avoirdupois weight—an amount of solid material which, if compressed, the farmer might with ease have carried home in one of his coat pockets!'

The waters of the ocean teem with life in a variety of forms. We cannot take up a glassful of this element without including many beings of interest. 'The cheapness of the pleasures which natural history affords, should of itself form a reason for the general cultivation of such pursuits. They are within the reach of the most humble, and are not dependent on costly or complicated apparatus. By means so simple as a glass of sea-water, we have caused the balani or acorn-shells to exhibit a series of movements, which we have never shown to the youth of either sex without hearing from them expressions of the most unfeigned delight. Let the reader try the experiment. Go at low water to a rock on the beach, choose a few of the oldest and largest limpets left uncovered by the receding tide, and incrustated with the acorn shells. As the enclosed animals have then been without nourishment for two or three hours, they will be quite ready for another meal. Throw the limpet-shells into the glass of sea-water, and in a minute or two the acorn-shells upon them will begin to open. Presently a beautiful feathered apparatus will be extended; then withdrawn. It will again be put forth, and again retracted; but with such grace, regularity, and precision, that the eye regards it "with ever new

delight." And when the same exquisite mechanism is exhibited by every one of them, either in succession or simultaneously, and when we consider that it thus ministers at the same moment both to respiration and nutrition, a train of ideas is excited which rises from the humble shell to Him by whom it has thus wondrously been fashioned.'

FACTS FOR THE CURIOUS.

THE moon, when at full, reflects upon the earth only about one three-thousandth part of the light of the sun; and the lunar rays, even when concentrated by a powerful lens, and the focus directed upon the bulb of a delicate thermometer, do not affect it in the slightest degree; hence the phrase, 'the pale cold moon,' is not only poetically beautiful, but philosophically correct.

The volume or bulk of carbonic acid gas expired by a healthy adult in twenty-four hours is said to amount to 15,000 cubic inches, containing about six ounces of solid carbon. This is at the rate of 137 pounds avoirdupois per annum; and taking the total population of the globe at seven hundred and sixty millions, the amount of solid carbon or charcoal every year produced by the human race will exceed 46,482,143 tons! Adding to this all the carbon produced by the combustion of fires and gas-lights, by the decay of animal and vegetable matter, the exhalations from springs, &c. there need be no marvel as to the source whence plants derive their solid or woody material (which is principally carbon), seeing that their leaves are specially fitted for the absorption of carbonic acid gas from the surrounding atmosphere.

In Britain, the deposition of dew from the atmosphere is generally less during the continuance of an easterly than of westerly winds, a phenomenon attributable to the different nature of the surfaces over which these winds travel—the former crossing the continent of Europe, and thus becoming comparatively dry or arid; the latter sweeping across the vast expanse of the Atlantic Ocean, and therefore becoming moist or hydrated, requiring but little reduction of their temperature for the copious deposition of dew to ensue upon terrestrial objects.

The atmosphere immediately incumbent upon the earth has the power of absorbing and retaining more of the blue rays of light than that at greater altitudes; and thus when we cast our eyes on high, we look through a volume of the densest air replete with blue light; and so likewise if we look abroad over an extensive tract of country, the horizon of which is formed by distant hills, they appear blue, or, in other words, they partake of the colour of the medium through which they are viewed. If we journey to them, the blue colour gradually vanishes, and at length their ordinary colours appear; and now, looking from the hills towards the spot from whence we journeyed, it in turn appears blue. The ridge called the 'Blue Mountains' in Australia, another of the same name in America, and many others elsewhere, are not really blue, for they possess all the diversity of scenery which their climates can give; but to the eye which first discovered them, bent on them generally from a distance, they all at first appeared blue, and they have retained the name.

'In addition to the numerous mechanical uses of wood,' says Mr Griffiths, 'and its chemical use as a source of artificial heat, the chemist discovers that it is capable of a most curious change or transmutation into edible matter; in fact, a kind of bread may be made from wood. This is effected by selecting the sawdust of the least resinous wood—that of beech, for example—washing it with water to remove all soluble matters, and then gently drying it in an oven; after this, it is mixed with marshmallow juice, and formed into cakes, which are baked at a high temperature; and these, reduced to fine powder, with the addition of a little corn flour and leaven, form a dough, which, when moulded into loaves, and baked, constitutes bread more palatable than that prepared in times of scarcity from bran and husks of corn.'

Towards the end of autumn may be often observed in the fields marks of footstep, which appear to have scorched the grass like heated iron: this phenomenon was formerly regarded with superstitious dread, but can now be explained upon very simple chemical principles. When the grass becomes crisp by frost, it is exceedingly brittle, and the foot of a man, or even of a child, is sufficiently heavy

to break it completely down, and effectually kill it; therefore, when the sun has thawed the frosty rime from the fields, these foot-tracks appear brown and bare in the midst of the surrounding and flourishing green grass.

The earth—speaking roundly—is 8000 miles in diameter; the atmosphere is calculated to be 50 miles in altitude; the loftiest mountain peak is estimated at 5 miles above the level of the sea, for this height has never been visited by man; the deepest mine that he has formed is 1650 feet; and his own stature does not average 6 feet. Therefore, if it were possible for him to construct a globe 800 feet—or twice the height of St Paul's cathedral—in diameter, and to place upon any one point of its surface an atom of 1-4380th of an inch in diameter, and 1-720th part of an inch in height, it would correctly denote the proportion that man bears to the earth upon which he moves.

With respect to the distribution and growth of the vine, it requires, according to Meyen, at least five months of a mean heat of 59 degrees Fahrenheit to produce good wine. If September and October, the season when the grape fully ripens, have not this degree of heat, the wine is sour; and a country where this is the case is therefore unsuitable to the culture of the vine.

The shores of the lake Titicaca, in Peru, 12,700 feet above the level of the sea, are enclosed by a thick forest of a beautiful rush, which plays an important part in the economy of the surrounding district. Indeed the people of that country would live in great wretchedness if nature had not bestowed on it these plants, for it lies far above the limit of trees, and only a few bushes grow in its neighbourhood. These rushes supply the natives not only with fuel, covering for their huts, and with matting, but they supply material for the construction of their rude balsas or boats, which are merely rush-woven, as are also the sails that waft them across the waters.

The works in operation for draining the lake of Haarlem seem to have stimulated the ingenuity of the projectors to a still more gigantic undertaking, which may be safely characterised as the boldest enterprise of the age; namely, the drainage of the Zuyder Zee, which, according to a plan published at the Hague, is proposed to be effected by the construction of an immense dike, cutting off the communication with the North Sea, and by forming a canal between Amsterdam and the coast, into which are to be diverted the rivers which at present empty themselves into the Zuyder Zee. The expense of this undertaking is estimated at ten millions sterling. The reader may not be aware that the Zuyder Zee was at one time an inland freshwater lake, such as it is described by Pomponius Mela, and that its conversion into a gulf of the sea was effected in the thirteenth century, when violent storms destroyed the barrier between the ocean and the lake. Traces of this barrier still exist in the sandy islands and shoals between the Kelder and Ter Schelling.

We perceive from the newspapers that the South-Eastern Railway Company have established their confidence in the practicability of the submarine telegraph, by making preparations to lay down a line between Folkestone and Boulogne!

DAVID RHYS, THE 'CHIEF MUSICIAN TO THE QUEEN OF THE FAIRIES.'

North Wales did not boast of a more perfect musician than David Rhys. Vain was it for any other harper to enter into competition with him at Eisteddfod, or in bower or hall; he won all the prizes, and enchanted every ear. Other bards struck their harps, but no applause followed; and in a fit of rage and jealousy they snapped the wires, and threw their harps aside—at least so says David Rhys. Lords, nay, even princes, offered David riches and honours if he would strike his harp within their halls; but he loved his dear native country too well to be tempted to leave it for either honour or gold. Higher honour than any lord or even prince could bestow was in store for him, however; for one lovely evening in summer, as he was walking in this glen, and meditating on the beauties of nature, or every now and then striking a wild strain on his harp, he was somewhat startled by the sudden appearance of what he at that instant imagined to be a most beautiful little child. The smiling, bright-eyed boy came dancing up to David, and requested the harper to follow him to his father's hall, where, he said, a large party was assembled in the hope of hearing David's ravishing strains. David

Rhys was little in the habit of following anything but his own pleasure; but he now felt as, if he was spell-bound, and that, whether he liked it or not, he must follow this lovely infant wheresoever he might lead him. So, without asking a single question, he followed the child up the glen. He was obliged to run, to keep pace with his juvenile and nimble guide; but on turning into a path that led to the mountain, a mist suddenly enveloped them, and at the same instant David was assailed by 'a hundred wry-mouthed elves,' who asked him whether he would travel above wind, below wind, or under wind. A soft voice whispered in his ear, 'soar not too high; but beware how a mortal of your genius abases himself too low.' David instantly exclaimed, 'I will travel under wind!' Scarcely had he uttered the words, than he felt himself gently raised from the ground, and was borne softly and pleasantly through the regions of mist. After travelling in this luxurious style for some time, he suddenly felt that he was descending towards the earth; and just as his feet rested on it, the mist disappeared, and he found that he was standing at the bottom of a magnificent flight of marble steps, that led to the entrance-door of a most unearthly-looking mansion. His little guide was once more at his side, and conducted him up the steps; but when he threw open the door, a scene of such dazzling splendour burst upon his sight, that David was obliged to set down his harp, and veil his eyes with his hands. A chair of ivory and gold was brought for him, and after a little practice, he found he could bear the dazzling light, and began to look around him. He saw that he was surrounded by beings not of this world, for the height of the tallest of the numerous group did not exceed that of a child of two years of age. Both sexes were exquisitely formed; their complexions were alike fair and transparent; and their heads were covered with long and flowing ringlets. The females were attired in pale-green robes, with girdles of flowers, and with dew-drops that glittered like diamonds in their hair. The bard began to play, and his tiny audience to dance; and so enchanting a sight, he declares, was never before vouchsafed to mortal eyes. A most delightful beverage was frequently handed to him in a small gold cup; it resembled nothing that he had ever tasted before, and seemed to inspire him with quite a magical touch on his harp. Midnight had long passed, and still the unwearied group danced on. At length trays of gold, covered with cups not bigger than those of the acorn, and filled with milk, were handed round, and the harper received permission to retire to his bed. His beautiful little guide came forward, and showed him the way to the luxurious chamber that had been prepared for him. David instantly threw himself on a couch formed of gold and ivory, and fell into a deep slumber. Picture to yourself his surprise and horror, on awaking early in the morning, shivering with cold, and aching in every limb, to find that he was lying on the cold ground, instead of a bed of down; and that not one stone was left of the splendid mansion in which, a few hours before, he had displayed his wondrous powers on the harp. But a moment's reflection banished all unpleasant feelings, and pride and exultation filled his heart; for he now felt convinced that his strains had been considered worthy the attention of immortal ears; and that he had spent the night in the presence of the king and the queen of the fairies, and all their attendants, he could no longer doubt. A proud man from henceforth was David Rhys; and many a good horn of ale has he won by relating this adventure, in hall or kitchen, on a winter's night.—*Llewelyn's Hair, or North Wales.*

NOTHING IN VAIN.

Although it was midsummer, the snow where we stood was from twenty to one hundred and twenty feet deep, but blown by the wind into the most irregular forms, while in some places the black rock was visible. Beneath the river and valley of Maypo, fed by a number of tributary streams, which we could see descending like small silver threads down the different ravines. We appeared to have a bird's-eye view of the great chain of the Andes, and we looked down upon a series of pinnacles of indescribable shapes and forms, all covered with eternal snow. The whole scene around us in every direction was devoid of vegetation, and was a picture of desolation on a scale of magnificence which made it peculiarly awful. But the knowledge that this vast mass of snow, so cheerless in appearance, was created for the use, and comfort, and happiness, and even luxury of man; that it was the inexhaustible

reservoir from which the plains were supplied with water—made us feel that there is no spot in creation which man should term barren, though there are many which nature never intended for his residence.—*Sir Francis Head.*

ROBERT BRUCE CROWNED BY THE COUNTESS OF BUCHAN.

THE Bruce is on his bended knee—a king, without a throne;
Of Scotland's realm the rightful lord, yet not one rood his own:
His altar—the few faithful hearts that gather round him there;
His anthem—the lone orphan's cry, the childless widow's prayer.

There steps a noble lady forth, and cries, 'The right is mine—
My fathers for long ages past crowned Scotland's royal line;
My craven brother loves to stay 'midst English pomp and glee:
'Tis I will crown the Bruce, and send him forth to victory.'

She placed the circlet on his brow—her hand nor shook nor quailed;
She said the consecration prayer—her firm voice never failed:
'Thou fightest not for thirst of fame, nor fell ambition's laws,
But for our fair and weeping land, and for a holy cause.

A wailing from our ravaged homes cries, "Set thy country free!"
The voices of our little ones call loud, brave Bruce! on thee:
In counsel wise, in purpose firm, in battle armed with might
Be thou! Go forth and fight for us, and God defend the right!"

The right has won! The Bruce now sits upon a royal throne;
And far and wide his eye beholds the fair realm, all his own.
The noblest king that ever yet held sway in Scotland's land,
Anointed was with woman's prayer, and crowned by woman's hand.

HINTS ABOUT BEDROOMS.

Their small size and their lowness render them very insalubrious; and the case is rendered worse by close windows and thick curtains and hangings, with which the beds are often so carefully surrounded, as to prevent the possibility of the air being renewed. The consequence is, that we are breathing vitiated air during the greater part of the night; that is, during more than a third part of our lives: and thus the period of repose, which is necessary for the renovation of our mental and bodily vigour, becomes a source of disease. Sleep under such circumstances is very often disturbed, and always much less refreshing than when enjoyed in a well-ventilated apartment: it often happens, indeed, that such repose, instead of being followed by renovated strength and activity, is succeeded by a degree of heaviness and languor which is not overcome till the person has been some time in a purer air. Nor is this the only evil arising from sleeping in ill-ventilated apartments. When it is known that the blood undergoes most important changes in its circulation through the lungs by means of the air which we breathe, and that these vital changes can only be effected by the respiration of pure air, it will be easily understood how the healthy functions of the lungs must be impeded by inhaling for many successive hours the vitiated air of our bedrooms, and how the health must be as effectually destroyed by respiring impure air, as by living on unwholesome or innutritious food. In the case of children and young persons predisposed to consumption, it is of still more urgent consequence that they should breathe pure air by night as well as by day, by securing a continuous renewal of the air in their bedrooms, nurseries, schools, &c. Let a mother, who has been made anxious by the sickly looks of her children, go from pure air into their bedrooms in the morning before a door or window has been opened, and remark the state of the atmosphere—the close, oppressive, and often fetid odour of the room—and she may cease to wonder at the pale, sickly aspect of her children. Let her pay a similar visit some morning after means have been taken by the chimney ventilator, or otherwise, to secure a full supply and continual renewal of the air in the bedrooms during the night, and she will be able to account for the more healthy appearance of her children, which is sure to be the consequence of supplying them with pure air to breathe.—*Sir James Clark on 'The Sanative Influence of Climate.'*

A WORD ON LAND.

CERTAIN improvements made by Lord George Hill on his estate of Gweedore, in Donegal, were lately made the subject of an article, which, we understand, has given no little satisfaction to parties who entertain the idea that a proper system of land allotments is the one thing needful for Ireland, or any other country with a poor and redundant population. On the question of land allotments, the article pronounced no opinion, nor did it even allude to any such principle of rural arrangement. It presented only the interesting narrative of a nobleman having reclaimed a hitherto intractable peasantry from barbarous habits, and settled them in small allotments or farms on a formerly mismanaged estate. For this, as the best, if not the only thing which could be done in the circumstances, Lord George Hill, we said, deserves high praise. His conduct in every respect offers a bright example to Irish landowners generally, and we trust it will not be lost upon them.

Out of such proceedings, however, as those in which his lordship has been engaged, arise some grave considerations as to ulterior consequences, and on these we desire to speak frankly and emphatically. The allotment of small pieces of land—say one or two, or even four acres each—to be respectively farmed by annual or leasehold tenants, at a reasonable rent, is a great advance on a universal confusion of holdings, as was the case at Gweedore; and not being aware of what Lord George Hill proposes to do next, we cannot express a definite opinion as to the probable consequences of his generosity. There is no difficulty, however, in saying what may be expected if the arrangement be left to work in its original form. For a few years, the aspect of affairs will be greatly improved; but by and by the families of the settlers will increase in number, and remaining on the property, with or without subdivision of lands, there will ensue a condition of poverty and wretchedness which it may defy every available expedient to remedy.

Such must inevitably be the consequence of every scheme for allotting patches of land to poor agriculturists, unless at the same time provision be made for employing or carrying off to new fields of enterprise the redundancy of the population. After the long experience of the wretchedness produced by patch-farming in every part of the empire, Ireland in particular, it strikes us as something very remarkable that men should be seen advocating the institution of the practice on a wide scale, as a means of national prosperity. Fascinated by the seeming humanity of bestowing allotments upon paupers, and gratified by the first appearances of prosperity which probably ensue, they altogether forget what is to come next—overcrowded cottages, new pauperism, and a poor-rate which may pretty nearly absorb the whole rental of the parish.

Humanity is an amiable virtue, but humanity without consideration suggests and does some very foolish things. At this moment a scheme is on foot in England and Scotland for buying and giving an acre of land to every working-man who is a member of a certain association. In other words, a section of industrious and well-disposed operatives leave, through the agency of some clap-trap humanity-man, been deluded into the fancy that each of them would be happy if he became the owner of a morsel of land—land situated, perhaps, hundreds of miles from the place of his ordinary occupation. We have no hesitation in denouncing this project as one of the greatest follies ever conceived. While Nature's laws work as they are doing, there cannot be a doubt that it will terminate in the loss and discomfiture of all concerned. Supposing, however, for the sake of argument, that each of the members of the association really does get his acre, has he fully reflected on the propriety of leaving his present employment, and beginning to a certain extent the business of agriculturist? also on the possibility of rearing a family on the proceeds? We earnestly wish that the members of the association in question would ponder on these things before it be too late. It may perhaps be alleged that the possession of a small piece of land in connexion with his cottage raises a working-man materially in his own respect, and that it affords healthful occupation at leisure hours. We agree with these propositions; but here, as in all other matters, it is desirable to calculate the balance of advantages and disadvantages.

In all cases in which a working-man has a reasonable assurance of permanent and properly remunerative employment in any particular place, it may be for his advantage in various ways to own a house and garden or small piece of land; but if he possess no assurance of this kind, and is exposed to the necessity of seeking employment in another district, it will be preferable to rent by the year at most what accommodations he requires. Instances of the advantage of small proprietorship are no doubt common; but so also are instances of a contrary nature. In many country towns and villages, a number of the inhabitants following handicraft employments possess small pieces of land, and also dwelling-houses; in Scotland, where they abound, they are termed *bonnet lairds*. Now, it is our conviction, from sundry examples which have fallen under our notice, that these inheritances are frequently injurious to families. Proud of their petty properties, proud of having a vote for members of parliament, proud of being *lairds*, they lead a poor struggling existence; yet, attached, nailed, as it were, to the spot, they cannot be induced to remove to places where they would be properly employed and remunerated. On one occasion, a laird of this sort, who was starving with his family on four shil-

lings a-week, which he realised as a handloom weaver, could not be persuaded to come to Edinburgh to be employed at fourteen shillings a-week, because by doing so he would have abdicated his dignity as a proprietor, and become only a plain operative. The heritable possession of dwelling-houses, or scraps of land, we repeat, may in many instances be injurious to working-men. It indisposes them for removal; fixes them to a spot; whereas, in order to make the most of their labour, which is their capital, they ought to hold themselves ready at the shortest notice to remove to places where the highest wages are to be obtained.

Our opinion regarding heritable property generally is, that it is better in the hands of persons who make a business of letting it, than in the possession of those who at once own and have to use it. Among the middle as well as the humbler classes, where there is little chance of any temptation or need for removal, the purchase of a house may be advantageous. In numberless instances, however, persons who buy or build dwelling-houses for their own use, get tired of them, or in time find them unsuitable, and are tormented till they get them off their hands. Unless, therefore, from particular circumstances, it is on the whole best to lease houses for private residence, leaving capitalists, by general competition, to provide the accommodation wanted.

With respect to land, it is, in the greater number of cases, also advisable to leave it in the ownership of persons who lease it to others as a means of livelihood. Thus, for example, if the annual rent of an acre of land be L.4, it will be greatly preferable for an agriculturist to pay L.400 for the use of a hundred acres, than to expend the sum of L.12,000 in buying the property. And why? Because in the one case he is binding up a great deal of capital, which might be of service in his own proper business of husbandry—besides putting an embargo upon his personal freedom; while, in the other, he would not only keep his capital to farm the land properly, but be so far at his ease, that at the end of a term of years he could remove to a larger farm, or, without loss, altogether relinquish the trade of an agriculturist.

Landowners are usually considered as a very rapacious set of persons. Our notion is, that, as a whole, they are considerably behind the age in point of economic knowledge—that they have allowed themselves to be far outstripped in the adaptation of means to ends by the manufacturing and commercial classes; but if by rapacity is meant the exaction of unwarrantably large rents, the term is certainly not applicable. In adventuring money in trade, it would be deemed a poor enterprise which did not return from ten to twenty per cent. of profit. Besides, money so risked may be turned over several times a-year. A tradesman, laying out L.100 in a speculation in January, may have a final return of L.200 before the end of December. The landowner has no such chance. In England, a freehold property in land may realise four per cent. per annum on the outlay; and in Scotland, it rarely returns above two and a-half per cent. What a miserable affair is this! A gentleman spends L.30,000 in buying an estate, and all he gets back yearly is L.1200 if in England, or L.750 if in Scotland. Why the return should be so much less in Scotland, can only be accounted for by the fact, that in that country a certain imaginary dignity and political weight is associated with territorial possessions, thus causing a competition which raises the value of land considerably beyond its fair commercial value. Assuming, however, that L.1000 or L.1200 is realised,

the return is only annual. By no process can an agriculturist take more than one crop per annum; and so neither can a landowner get more than a year's rent for a year's use of his property. While the manufacturer and merchant are daily planning extensions of their business, sometimes losing, but more frequently making large sums, in reward of their ingenuity and enterprise, the poor landed proprietor is left to pine on his meagre rental, or draw consolation only from the prescriptive fancy that he is the salt of the earth. A little consideration suffices to show that the landowner is a man more to be pitied than envied. His situation imposes on him a certain degree of state and ratio of expenditure, too apt to be beyond his means, and whatever goes wrong in the country, on him falls the principal blame. At present, the greater number of landed proprietors throughout the United Kingdom are in difficulties. Everything tends to prove that, as a class, they are not advancing; while it is equally clear that the manufacturing and commercial classes, from the circumstances adverted to, are already beginning to take the predominance in wealth and social importance. It is not difficult to see how this will end.

The proposition that land is held in trust by its owners for the general good of the nation, appears reasonable; for land is the source of food, and in the production of this article in due abundance every one is concerned. Partly, however, from ignorance, and partly from the effect of certain laws of inheritance, land has scarcely ever been under a rational system of tenure; that is, open to free disposal and competition. Pride has been at the foundation of the mischief. In some countries, the inheritance of land belongs prescriptively to the eldest son of the deceased owner, to the exclusion of his other children; and in some cases, to make this principle of primogeniture doubly sure, the inheritance is destined, by deed of entail, to go in all time coming to the nearest male heir of the deceased. On this account, large properties are daily passing into the hands of elder sons, greatly to the injury of brothers and sisters; and, what is more painful, properties are going out of families altogether, leaving daughters pretty nearly destitute, and are seen passing into the hands of remote male heirs, who perhaps are in the enjoyment of handsome estates already. This entail system is more rigorous in Scotland than in England, and has greatly damaged the general and individual interest in land. Reducing the proprietor to the position of a life renter, he is indifferent to improvements; and if otherwise disposed, he has not the means to execute any beneficial alterations on his property. Lately, in pity of these unfortunate proprietors, a law was passed empowering them to borrow money from the state to improve their lands. How humiliating the position! What would be thought of the state being asked to lend money to manufacturers to renovate their buildings and machinery? The universal and proper remark would be, that those who could not draw on private resources for such renovations, should sell their properties to men of greater wealth. The same remark, therefore, ought in propriety to be applied to those owners of lands who are destitute of means for their improvement. A law abolishing, or greatly modifying entails, would have been the reasonable plan of procedure.

Contemplating the evils which arise from a too rigorous law of primogeniture and entail, the people of other countries have gone to an opposite extreme, and instituted laws making it obligatory on the father of a family to leave his property in equal portions

to all his children. This is a tyranny and a folly as revolting to common sense as the most outrageous law of entail. A man, by successful industry, acquires means to purchase an estate, consisting of a hundred acres of land. He has five children, three of whom are well-behaved, and have afforded him much comfort; two are depraved, and act in defiance of all admonition. He would wish to divide his property into three, for the sake of the well-behaved; but this the law does not allow him to do. He dies, and the estate is parted into five equal portions. Each child has now twenty acres, and the same law again operates to subdivide. Suppose each to have five children, then each of these gets four acres. There are now twenty-five proprietors instead of one. But the subdivision does not stop; on it goes, generation after generation, till at length the whole land is cut up into paltry sections not the size of a cabbage garden.

Such is the process now going on at a rapid rate in France; and any one who wishes to have a comprehensive idea of its consequences, will find the subject amply treated in the lately issued number of the 'Quarterly Review.' The only modifying arrangement in that country consists in the father being allowed to leave by will a certain share of his property. If he has only one child, he can bequeath a half; if he has two children, he can will a third; and so on. But this has little practical efficacy, and as the father is not allowed to make a gift of his property during his life, he is, in fact, little better than a puppet in the hands of his family. Far better the most stern law of primogeniture than this grossly demoralising and impoverishing folly. It appears that, with a population of about thirty-five millions, France has upwards of eleven millions of landed proprietors, at least five millions of whom own no more than five acres each, and a vast number not more than one acre. It is calculated that five and a-half millions of these proprietors do not realise individually above £11, 10s. annually; and yet, with their families, they amount to twenty-seven millions of souls. Thus the great bulk of the population of France, with the name of proprietors in enjoyment or prospect, are in a condition allied to that of paupers. That even in this abject and precarious state they enjoy greater tranquillity and independence than their forefathers prior to the Revolution, may be acknowledged; but to compare them—a poor, bare-legged, wooden-shoed, half-clad, half-fed set of beings—with the artisans of Great Britain, would be manifestly absurd. Yet, as we have said, some people are actually so insane as to propose a subdivision of lands in these islands on a similar scale. In certain districts of France the morsels of land are so small, that some families own no more than a single ridge; and the consequence is, not only excessive poverty, but constant litigation as to the elucidation and settlement of rights. If this practice of subdivision remain unchecked by law, an agrarian convulsion, more fearful in its effects than the Revolution of 1793, will, in the course of another generation, inevitably ensue.

All things considered, we arrive at the following propositions respecting the tenure and management of land. First, that land, like every other commodity, ought to be at the free disposal of its proprietor, to sell it or bequeath it as he thinks proper—subject, of course, in the latter case, to making a reasonable provision for widow and children. Second, that land should be agriculturally managed in that form which would cause it to yield permanently the largest amount of produce at the smallest expenditure of means. If it can be shown, therefore, as we confidently believe it can, that

large farms, by an exact economical management, will give to the nation food in greater abundance, and at less cost, than small farms could propose to do, then large farms are in every respect the most suitable and commendable; and all excessive cutting up of properties ought to be deprecated, as a source of general impoverishment and disaster.

W. C.

THE SCULPTOR OF BRUGES.

About the middle of the sixteenth century, there was not an artist in the Netherlands whose fame had spread wider than that of Messer Andrea, the sculptor of Bruges. His father had come from Italy, and settled in Flanders, where he lived and struggled, an ardent and enthusiastic artist, whose genius cast just sufficient light to show him his own defects. This love of the beautiful was the sole inheritance he left his son. But Andrea's northern birth and education had, to a certain extent, qualified his Italian descent, so that to his father's ardent nature he added a steady perseverance, without which all the genius in the world is but as a meteor of a moment.

The branch of art that Andrea followed was wood-sculpture, in which, by his wonderful skill, he surpassed all his contemporaries. In our day, it is impossible, from the few relics that remain, to know the perfection to which our ancestors of the middle ages carried this beautiful style of art; when Gothic saints and Madonnas looked down from their niches in cathedrals, though the names of the unknown artists who carved these beautiful heads and graceful draperies were forgotten, even before the frail material in which they worked had lost its freshness.

The sculptor of Bruges was one of these now-forgotten artists; and yet an artist he was, in the highest sense of the word. He lived and moved among beautiful forms and ideas; they influenced his character, and refined his mind, yet did not make him unfit for association with the world. Riches and honour came with his fame, until he stood high in the regard of his fellow-citizens; and the son of the poor Italian student was at last deemed worthy to wed one who had long been the object of an almost hopeless love, a daughter of one of the highest families in Bruges. This union could not but be a happy one; and Andrea and his wife slowly advanced towards middle age, feeling that their present bliss had not belied the promise of their youth. Still, there were a few bitter drops in their cup: the husband and wife saw several of their children drop off one by one, until all that remained were two boys and a daughter—the lovely little fair-haired Gertrude, who was her father's darling. Nevertheless, these were sufficient to make the sculptor's home cheerful, and the lost brothers and sisters were hardly missed.

At the time when our story begins, Andrea had finished his latest work. It was a group of angels, carved in wood, to adorn the church of Bruges. The burghers crowded to gaze upon and admire the work of their fellow-citizen, of whom they were so justly proud. It was indeed a beautiful specimen of the ancient Gothic style, such as one meets with sometimes even now in old churches, where the hand of innovation has not reached. Three angels formed the group, one kneeling with raised eyes and humbly-folded hands, while the other's stretched-out arms were lifted upwards in rapturous adoration; and the third, looking down on the worshippers below, pointed towards heaven. The perfect beauty of expression, the grand, yet simple masses of drapery, falling in broad folds, which are the characteristics of this style, won universal praise. The artist stood by, in pleasure, not unmingled with honest pride, when many a hand shook his own in friendly congratulation, and many an eye, made humbler by rank and distance, looked at him admiringly.

In all the pleased assembly there was but one dissentient voice, and that was from a brother artist and rival of Andrea. Melchior Kunst was one of those dark and unquiet spirits who seem to cast a shadow wherever they go. He was a man of great talent, noble to look

at, and at times most fascinating in manner, and yet no one loved him. There appeared to be an atmosphere of gloom and distrust about him, which made his fellow-men shrink from him. Even now, all instinctively made way for him, and Melchior strode on until he stood opposite the group. He folded his arms, and looked at it fixedly from under his dark brows. Then he addressed the artist, who stood at a little distance.

'Doubtless you think this very fine, Messer Andrea!'

'It is not what I think of it, but the judgment which the world puts on my work, that is of consequence,' answered Andrea calmly.

'And you never saw this design before!'

'Certainly not; it is my own.'

'Indeed!' said Melchior with that quiet sneer which is so galling, sitting on his curved lips—the handsomest feature of his very handsome face. 'Indeed! And so you never go into another's studio, and copy limbs, and attitude, and design, as you have here stolen from me!'

'It is not true,' said Andrea, with difficulty restraining his passion.

'I tell you it is,' cried his opponent. 'Look, gentlemen, brother artists; look! this figure is mine—my own design; and here I execute my will upon what is my own!' and he drew a hatchet from under his cloak, and before the wonder-stricken spectators could interfere, he severed one of the upraised hands of the nearest figure.

Andrea was stung to the quick by this mutilation of his work; all his Italian blood was roused within him: with a sudden impulse he rushed upon Kunst with the fury of a tiger at bay. Those around interfered; but it was needless, for Andrea's well-constituted mind had already got the better of his momentary rage, and he stood pale, but self-possessed, gazing alternately at his adversary and at his own despoiled work.

'Melchior Kunst,' said he at last, 'you think you have done me a great injury; and so you have, but not an irreparable one. I will not revenge myself now, but you will be sorry for it some time.'

A loud laugh from Kunst made the sculptor once more clench his hands, while the bright-red mounted to his brow; but he said no more, and after Melchior's departure, he too left the hall with some friends, who were stricken dumb by this untoward event.

It was late in the evening when Andrea returned towards his own home. He walked slowly along by the side of the dark and gloomy canal, which the setting light of the young moon only made more solemn and fearful. Thick ivy-hung walls, even in the daytime, cast a heavy shadow on the water; and now it looked like some dark abyss, which no man could fathom. Here and there some pale solitary ray of moonlight pierced through the branches of the acacias that overhung the opposite side, seeming like a bright arrow flashing through the darkness.

Andrea's heart was very heavy. His triumph had ended in pain: disappointment not only at the injury done to his work, but at the unjust accusation of Melchior Kunst. Andrea knew how ready are the suspicions of the world when once aroused; and he fancied that already cold and doubtful eyes examined his group with less favour than heretofore. And besides, the sudden ebullition of anger to which he had been goaded left a weight behind, both bodily and mental; for with men of Andrea's gentle and not easily-roused temperament, such excitement ever causes a painful reaction.

The sculptor walked on quickly amidst the gathering darkness of the night, for the moon had now set. He fancied now and then that he heard stealthy footsteps at a distance behind him; and perhaps this made him unconsciously urge his pace. Andrea was no coward, but it was a lonely place by the water-side, and he was unarmed. Still, as the footsteps approached no nearer, he reproached himself for yielding to the delusion of an imagination heated by the events of the day. All at once Andrea heard distinctly a plunge in the water of some heavy body. His first idea was, that some unfortunate had thus ended his life and his miseries; but the sound was so distant, that he was uncertain. He retraced his steps; but

there was nothing to justify his previous thought. The canal flowed on, silent and dark as before: not a struggle, not a groan, not a cry rose up from its gloomy depths. It could have been only a heavy stone, which had fallen from the old dilapidated wall into the waters beneath. Andrea felt sure of this, and went on his way until he reached his home—a home where, since he left, danger and anxiety had entered.

Three days after this, two armed officers of justice made their appearance in the dwelling of the sculptor of Bruges. They came to take prisoner the master of the house, accused of the crime of murder. From the day of the contest in the hall, Melchior Kunst had never been seen until that morning, when his lifeless body had floated up from the bed of the canal into the very market-place, a fearful spectre among living men. Then one of the horror-stricken bystanders remembered that on the same night of their quarrel he had seen Messer Andrea pass by the way that led along the canal, and that not long after Melchior Kunst also followed. Another man, who lived near, had heard a plunge in the water, but thought it was only his own dog, who often at night swam across the canal. A third had met Messer Andrea beside the canal also, but had seen no other man. This was sufficient evidence to convict the unfortunate artist.

The officers found their prisoner alone. He was sitting with his head buried in his hands, and hardly moved at their entrance. One of them laid his hand on the sculptor's shoulder, and claimed him as a prisoner.

Andrea looked up with a face so listless, so vacant, so deadly pale, that the officer started, and unconsciously let go his hold.

'A prisoner!' said Andrea, without making an effort to move. 'What have I done! Who accuses me!'

The officer was a man of kindly nature, who had known Messer Andrea in former times. He gently and respectfully explained his errand; but had to repeat it several times before Andrea comprehended him. It seemed that some heavy cloud darkened his faculties. At last he understood the whole.

'So they accuse me of being a murderer—an assassin!' said he, rising, while a shiver ran through his frame. Then addressing the first officer, 'You were a good man once—follow me.' The other hesitated. 'You need not fear,' continued Andrea; 'I am unarmed—I have no thought of escaping from justice.'

The man followed his prisoner until they came to a darkened room; it was the chamber of death. On the bed lay the pale and shrouded form of a woman. Very beautiful she must have been, and her beauty had scarcely passed its maturity. No long illness had taken away the roundness of health from her face, so that even in death she looked lovely as a marble statue. The long dark lashes rested on her cheek, and a few locks of jet-black hair, escaping from the fillet that bound her head, gave a lifelike air to her repose. By her side lay an infant—a flower of an hour—whose little soul had come from Heaven at sunrise, and returned thither at sunset. They were the wife and child of Andrea.

The sculptor pointed to the dead. 'Look there,' he said, 'and say if I am likely to have revenged any trifling insult—if I am likely to have been a murderer!' His voice grew hoarse; he stretched his arms towards the body of his wife, and then fell to the earth in strong convulsions.

Andrea, during nearly the whole time that elapsed between his apprehension and trial, was dead to the consciousness of his misery. A low fever enfeebled all his senses, and reduced his outward form to the appearance of an old man. His friends—for he had still many—took both his sons to their charge. It was well they did, for the father seemed to have lost all remembrance even of their existence. When they visited him, he took not the least notice of them; so the children were at last wisely sent far away from the scene of disgrace and suffering. But with Gertrude the father would not part. She was a sweet little creature, the image of her mother in feature and expression, but her complexion resembled her father. Her eyes were of that deep violet hue which is seldom

born beyond childhood—so dark, that a careless observer would call them black. Gertrude's hair was of that colour which the old masters often gave to heads of Christ and of the Virgin—a mingling of warm brown and reddish gold tints, which the uninitiated might call red, but which painters know to be the most beautiful of all shades. It gave to sweet Gertrude the appearance of an angel, for in the sunshine it looked like a coronet of golden light around her head. If ever human form seemed the visible embodiment of a perfect soul, it was this child's. We have lingered over the picture of her, partly because we love to think of beauty, and partly because such descriptions always give vividness to events that are long gone by.

The first evidence that Andrea gave of returning consciousness to things around him, was in recognising his little daughter, and calling her by her name. It was her mother's also; and perhaps that, aided by the strong resemblance, was a comfort to the widowed husband. He began to talk coherently, first with Gertrude, and then with others who came to see him; and by degrees his mind and body gathered strength, so that he was able to think of his defence against the terrible crime laid to his charge. This was a momentous thing, for the proofs were all against him, and Andrea could bring no evidence in his favour, save his own explanation of what had happened on his way homewards that fatal day, and the irreproachable character he had borne all his life.

At last the sculptor of Bruges was brought from his prison to the judgment-hall where he was to be tried. He seemed to himself like one risen from the grave, and indeed so he appeared to those about him. Andrea had been a strong, powerful, noble-looking man, but now all his flesh had shrunk away, and his height only made him appear more shadowy. Dark circles were round his eyes, and his face bore an unvaried sallow hue. Nevertheless, his mien was firm and composed; no one could look at him, and doubt for a moment his innocence. Andrea's little daughter stood by his side: one might have likened her to a flower growing close beside a tomb. Gertrude had become accustomed to the change in her father's looks, and the shocked and anxious gaze of all around struck her with alarm. She crept closer to him, never taking her eyes from his face.

The trial proceeded. All was against Andrea: even the words he had uttered before Melchior left the hall were brought in judgment against him: they had sounded like a threat. None that had known Andrea doubted in their own hearts that he was a guiltless man, but the circumstantial evidence was too strong to be gainsayed by the law. He was found guilty of the assassination of Melchior Kunst; and Andrea—the gentle, upright man, who had never lifted a hand against a fellow-creature, save in that one evil hour when he was driven to passion by Melchior Kunst—was removed from the hall of justice with the stain of murder on his name.

Condemnation was deferred for a short space, for the sake of the hitherto unsullied character of the criminal. In those days the hand of law was often tampered with, and never was it with greater show of justice than in this instance. Andrea's great talents, and the many friends who warmly protested how incapable he was of such a crime, interposed in his behalf. They succeeded in obtaining only a suspension of the sentence for a few months, that some chance might elicit the truth which so many doubted. But in the meantime the sculptor was ordered to execute some work of art to adorn the Palais de Justice at Bruges, where he had been tried. For this purpose he was brought from his cell, and confined in the hall which had witnessed his trial.

It was a large gloomy-looking chamber, so dimly lighted from without, that even at mid-day the dark shadows in the corners of the room looked like night. An immense hearth, on which lay a few fagots, was the only cheerful object, but even that light and warmth did not reach beyond the immediate vicinity of the fire. There was no furniture in the room, save one small table in the centre, a bench, and a straw couch in the gloomiest corner. It was a place in which one would instinctively shrink from

looking behind, and where the sound of one's own footsteps would sound hollow and full of dread, as if something fearful were following after us.

Andrea and his daughter heard the heavy door close, and they were alone in the hall. The little girl led her father to the bench beside the hearth, and then sat down at his feet, holding his hands fast in hers. She dared not look anywhere but at the bright fire and at her father's face; even the shadows that the flames cast on the ceiling made her start sometimes. Gertrude had been accustomed to a prison, for she had never left her father, except when taken home at night, to return next morning—but this place seemed gloomier than any before.

Andrea had no hope. His life had been free from any very heavy sorrows, and the first that came, so fearful as they were, overwhelmed him. His sole idea now was, to employ the short remnant of his life in executing some memorial of his talents to leave behind him, that, when time had removed the shadow from his fame, his children might have no reason to blush for their father. He returned again to his long-cherished occupation. For a while this gave him sensations almost amounting to pleasure. His step became lighter, and his countenance lost somewhat of the settled melancholy. He almost forgot his sorrows, his blighted name, his impending doom, in the exercise of his beloved art. He would cease from his work, look at the beautiful image which had risen to life under his hand, and murmur to himself, 'What man will say that the hand of an assassin has done this? that the brain which formed this idea of beauty could plan a murder!'

And by degrees the influence of his beautiful art in some measure soothed the mind of the sorrow-stricken man. His desolate prison became cheerful with the graceful forms which it contained, and Gertrude moved among the whole like a beautiful spirit. If ever the sculptor clung to hope and life, it was when he looked at his darling child, and at the more imperishable offspring of his genius.

At last Andrea's work drew nigh to a close: the sculpture was finished. Then it was that the enthusiasm which had sustained him faded away, and the artist's soul sank within him. He gave the last touches to his beautiful work—he knew he could do no more—and then went and sat in dumb stillness, in a stupor of grief and despair. Gertrude clung round him in affection, mingled with fear, but he did not speak to her or embrace her.

'Father, dear father, are you tired? Are you angry with your little girl?' and the child stood on tiptoe, trying to remove the hands which covered his face.

Andrea seemed hardly conscious of her presence, but repeated every now and then in a low tone, 'I have done my work—I have no hope—now let me die.'

The terrified child, who had been all along kept in ignorance of her father's doom, began to weep, but her tears were interrupted by the entrance of the magistrates of Bruges. They came to view the finished work of the artist. High as Andrea's reputation had been, they did not expect so beautiful a creation as that which now met their eyes. They looked upon it in silence, and then turned to the artist, who, wan and haggard, without a single ray of hope illuminating his pale features, stood behind his judges. One of them, an old man, was melted even to tears. Forgetting the dignity of office, the magistrate took hold of the criminal's hand and led him to a seat.

'You must not stand, Messer Andrea; you are not yet strong,' said he compassionately. 'Sit and rest while we examine your beautiful work.'

The sculptor obeyed without a word: he was passive as a child. Little Gertrude, who had shrunk away at the sight of strangers, came and stood silently behind her father, taking fast hold of his garments. The two magistrates inspected the sculpture, and could not restrain their admiration. The eye of the unfortunate artist brightened for a moment at their warm praise, but immediately his face returned to its accustomed melancholy.

'It is all in vain,' he answered; 'you cannot make men forget the past—you cannot take the shadow from the

name of my children—you cannot give their father life.'

The magistrates looked at one another, and the elder one spoke.

'There is hope still, Messer Andrea; have you courage to hear it!'

The artist started up, and raised his thin form to its full height. 'Tell me that I am proved innocent, and I will thank God and die.'

'We do not promise quite so much,' said one of the judges, wishing to temper Andrea's violent excitement.

'Only have hope. Many things have been discovered to-day,' continued the aged man whose kindness had first moved Andrea. 'Be calm now; to-morrow we may send you good news.'

The magistrates departed, leaving the poor prisoner with a wildly-throbbing heart, which he vainly endeavoured to still. All that day he sat with Gertrude in his arms, kissing her, fondling her, at times almost weeping over her. To all the questions of the wondering child he only answered, 'To-morrow, love; we may be free to-morrow.'

And when the attendants came to remove Gertrude for the night, he unclasped her arms from round his neck, with the promise that he too would go away with her to-morrow.

'Leave here to-morrow!' cried the happy child. 'Will you, too, leave this gloomy place to-morrow, and return no more!'

'God forbid I should return! No, my child, never more,' answered the father with a shudder.

'And shall we go out together—shall we go to our own home!' pursued Gertrude.

'Yes, dear child,' said Andrea, as he kissed her once more, and set her on the ground from his trembling arms, too weak for even so light a burthen. 'Yes, my Gertrude, I shall indeed go home to-morrow.'

He had spoken truth. Soon after daybreak next morning some officers entered the hall, bearing a release for the prisoner, whom the confession of a stranger had proved to be guiltless. Andrea was leaning on the table, his head resting on his arms, and his upturned face raised towards his work. But as they drew nearer, they saw that his countenance was meaningless, and that no life shone in his fixed and open eyes. The sculptor of Bruges was dead—his heart had broken with joy.*

THE ENGLISH IN INDIA.

ENGLISH society in India has latterly been undergoing numerous pleasing meliorations. While rapacity and sensuality have been disappearing, integrity and refinement have been correspondingly on the advance. Among other tokens of an improved taste, not the least conspicuous is the support given to a quarterly literary journal, the 'Calcutta Review'—an actual six-shilling review, in the English language, printed on the banks of the Hoogly! We wish to draw attention to this gratifying specimen of Anglo-Indian literature, as well as a few other points not undeserving of attention in England.

The Calcutta Review is an important work in itself, inasmuch as it frequently gathers into a single article the Indian information one would otherwise have to hunt for through a library; but it is likewise interesting from a circumstance not generally known in this country—namely, that some of its best articles are written by native contributors. This is a gigantic step taken by the Hindoo mind, and considered in conjunction with the numerous periodicals now circulating in the national dialects, and edited by natives, is full of delightful hope. Our present business, however, is with the

Anglo-Indians. Hardly a single number of the Review has appeared without at least one article containing a contribution towards the social history of our countrymen in Hindoostan; and we persuade ourselves that we shall be able to collect from its pages, without much assistance from other sources, a pretty distinct idea of their actual position and character. With this general acknowledgment to the Calcutta Review, we shall proceed, without thinking it necessary to distinguish in detail the information we may owe to it, except when that is adopted in its own words.

In the earlier part of the Company's history, their servants were sent out to fight and sell for their masters, and scramble as well as they could for themselves. Instead of a salary capable of supporting them, they were allowed all sorts of dishonest advantages in trade over the natives; and the consequence was, that, generally speaking, they scorned the regular gains of their appointments, and took to tyranny and spoliation. The unsuccessful never returned to Europe at all, while the comparatively few who had enriched themselves by unfair traffic, or something worse, brought home their huge fortunes and bilious physiognomies, to serve as studies for the playwrights, storytellers, and caricaturists. When Mr Shore, afterwards Lord Teignmouth, arrived in India as a writer in 1769, his salary was eight rupees a-month; and he complains bitterly that, notwithstanding this short allowance, the commercial speculations of the government servants had been so much burthened with restrictions, as to make the privilege of hardly any use. He adds somewhat later, that when on a mission to Dacca, he might have made L.100,000 but for his scruples; and later still, he was offered by a native prince (as a bribe of course) five lacs of rupees and eight thousand gold mohurs. Shore accepted only a picture, having no ambition to swell the rank of the 'nabobs' in England. About the same time Mr Forbes's entire income at Madras, from salary and other sources, was L.65 a-year; and the consequence was, that the poor cadet was frequently obliged to go to bed soon after sunset for want of a candle!

'You may not believe me when I tell you,' writes Sir Thomas Munroe, 'that I never experienced hunger or thirst, fatigue or poverty, until I came to India; that since then, I have frequently met with the first three, and that the last has been my constant companion. If you wish for proofs, here they are—I was three years in India before I was master of any other pillow than a book or a cartridge pouch; my bed was a piece of canvas stretched on four cross-sticks, whose only ornament was the greatcoat that I brought from England, which, by a lucky invention, I turned into a blanket in the cold weather, by thrusting my legs into the sleeves, and drawing the skirts over my head. In this situation I lay, like Falstaff in the basket—hilt to point, and very comfortable, I assure you, all but my feet; for the tailor, not having foreseen the various uses to which this piece of dress might be applied, had cut the cloth so short, that I never could, with all my ingenuity, bring both ends under cover; whatever I gained by drawing up my legs, I lost by exposing my neck; and I generally chose rather to cool my heels than my head. . . . My dress has not been more splendid than my furniture. I have never been able to keep it all of a piece. It grows tattered in one quarter whilst I am establishing funds to repair it in another, and my coat is in danger of losing the sleeves, while I am pulling it off to try on a new waistcoat.' This was during the period of nabobship, when a novelist who wanted to

* The leading incidents of this story are strictly true. The works of Andrea may still be seen in the Palais de Justice at Bruges.

enrich his heroine suddenly, had nothing to do but to find her an uncle in India.

Besides a universal rapacity, there was a prevalent and odious looseness of manners which shocked the unsophisticated natives. 'Those who came hither,' says the Calcutta Review, 'were often desperate adventurers, whom England, in the emphatic language of the Scripture, had spued out; men who sought these golden sands of the East to repair their broken fortunes; to bury in oblivion a sullied name; or to wring, with lawless hand, from the weak and unsuspecting, wealth which they had not the character or the capacity to obtain by honest industry at home. They cheated, they gambled, they drank; they revelled in all kinds of debauchery; though associates in vice, linked together by a common bond of rapacity, they often pursued one another with desperate malice, and, few though they were in numbers, among them there was no unity, except a unity of crime.' The fullest scope was given for the misconduct of such persons by the corporate immorality of the early companies; and we may suppose what a paradise the country must have been, when we are informed by the Abbé Raynal that the English were the best of the Europeans in India!

It is no wonder that the returned nabobs were seized upon with avidity by the romancers and dramatists, and that no exception was made in favour of individuals from the reprobation or ridicule showered upon the class. One of these curiosities—General Smith—when he was appointed high-sheriff of Berkshire, called a county meeting for the sole purpose of proposing to the noblemen and gentlemen to sanction a road to be cut through their properties, in order to enable him to drive to his seat of Chilton Lodge without the necessity of passing through the paltry town of Hungerford. The same nabob, on going into a gaming-house in St James's, and finding no company, laid himself down to sleep on one of the sofas, telling the waiter to take care that he should not be disturbed, 'unless some fellow or other came in who had spirit enough to throw a main at hazard for three thousand guineas.' The fellow proved to be the dissipated Lord Littleton, who entered the room singing, with some of his congenial companions, and at once accepted the challenge. He continued his song throughout the game, which he won; and pocketing the money in the midst of shouts of laughter, bade the general good-night. But General Smith—who was the Sir Matthew Mite of Foote—was as profuse in deeds of generosity as of folly. He supported, for instance, the banking-house of the Drummonds, in an emergency in 1772, with a deposit of £150,000; and this for no other reason than that some of the partners had occasionally given him half-a-crown when he was a boy.

In 1780, the first Anglo-Indian newspaper was published at Calcutta. It was called 'Hicky's Gazette,' and was a mass of slander and iniquity of every kind; in return for which an attempt was made to assassinate the editor. Before the end of the century, however, a great change for the better had taken place. Drinking, gambling, and rioting went gradually out of fashion; and Lord Cornwallis left the country on the fair road to social as well as political improvement. 'A reformation highly commendable,' says Mr Tennant in 1798, 'has been effected, partly from necessity, but more by the example of a late governor-general, whose elevated rank and noble birth gave him in a great measure the guidance of fashion. Regular hours and sobriety of conduct became as decidedly the test of a man of fashion as they were formerly of irregularity. Thousands owe their lives, and many more their health, to this change, which had neither been reckoned on nor even foreseen by those who introduced it.' Respectably conducted journals were now published, the number of half-caste children was diminished, and by degrees Anglo-Indian society assumed much of the appearance we find at home.

But all this was neither the effect of magic nor the doing of Lord Cornwallis. Anglo-India is peopled from England, and educated in England; and generally speaking, the same change of manners must be observable there which goes on at home. The reign of George III. was the epoch of a social reform at home which gradually changed the entire character of the people; and India partook of necessity in the revolution. The Company, sharing themselves in the change as individuals, made their service more respectable and more regular, by increasing the wages of their servants, and diminishing at once their power and their temptation to plunder; and thus an entirely new form was given to the personnel of their establishments. Formerly, the daring, the dissipated, the worthless members of a family were cast off to India—'whistled down the wind to prey at fortune;' but now that it had become a field of regular industry and honourable ambition, respectable men looked to the service as offering an eligible provision for the cleverest of their sons. Such men as these lads turned out were not fitted for the matrimonial prey of adventuresses; and accordingly, the ladies-errant were seen returning in great numbers from their land of promise. A new set of wives were now provided for the Anglo-Indians. As morality advanced, and the numbers of half-caste children began to dwindle; and, more than all, as the officers, civil and military, became worth a tolerable sum *living or dead*, the legitimate daughters of residents returned to India after their English education had been completed, and married and settled under the eye of their parents. Gradually, therefore, and naturally, the once jarring elements of society subsided into their present form. Occasionally a merchant comes back, with an ample fortune made by legitimate trade; and every day numbers of civil and military officers make their reappearance, with a provision, more or less comfortable or handsome, for life. But nabobs are among the things that were. A returned Indian is simply an English gentleman who has passed much of his time abroad; and we should wonder at his intimate acquaintance with things and persons at home, if we did not know that the increasing facilities and diminished charges of travelling had permitted him to keep up, by an occasional visit, his old associations. As for his wife and daughters, they have no difficulty in gliding back into the English tastes the Calcutta reviewer would persuade us they once abandoned; and we question whether it would be possible to distinguish, at a soirée, a fair Anglo-Indian from the rest of her countrywomen.

Fifty years ago, M. de Grandpré declared Calcutta to be 'not only the handsomest town in Asia, but one of the finest cities in the world;' and since then, it has obtained the title, by which it is popularly known, of City of Palaces. This is not derived from its public buildings, though these are both numerous and handsome, but from the private dwellings of the 'servants' of its merchant-princes. These dwellings have an extensive frontage, and abundance of pillars and porticos; and their white colour, seen through a hot and cloudless atmosphere, dazzles the eyes. Their rooms are usually large and lofty, opening *en suite*, and they are supplied with glass windows and Venetian doors. They are full of European furniture, the walls glittering with paintings, the floors covered with carpets, and the doors and windows hung with curtains. Plate, glass, porcelain, bronze, papier maché, alabaster, lamps, lustres and chandeliers—everything, in short, that taste and wealth could desire, is abundant in these luxurious abodes, where the inhabitants voluntarily broil themselves with the comforts of Europe under the tropic of Cancer.

In the article of female dress, there is usually seen in Calcutta a not less costly style of fashion. 'The immense investments of rich satins and gorgeous velvets—the latter rarely sold at less than a guinea a yard—which pass into the hands of consumers every cold weather, is altogether incommensurate with the number of ladies whose means and position would, in

English society, entitle them to the use of such costly attire.' Notwithstanding this, we are informed that there is no such thing as distress to be found in this brilliant and imprudent community. Formerly, according to Mr Forbes, when an officer of respectability, whether civil or military, died, a subscription was immediately set on foot for the widow and children, which was not only always liberal, but not unfrequently conferred on the parties a degree of permanent affluence greater than the prospects from which death had excluded them. At present, the reviewer tells us, such subscriptions are not known—simply because they are not wanted. The funds for the retirement of officers, and the maintenance of widows and children, together with the almost universal custom of life-insurance, do everything that before was accomplished through the painful means of charity. A young civilian is said, in the matrimonial market, to be worth £300 a-year, *dead or alive*, and a young military officer worth £100 a-year. Yet private benevolence is still active, not in occasional, and perhaps ostentatious donations, but in the regular support of hospitals, infirmaries, and other institutions; while the extra funds of the Anglo-Indians are likewise freely bestowed in the patronage of the arts and sciences, unknown to their predecessors of even the last generation.

The mode of spending a day in India has been frequently described, but, as regards the present time, very erroneously. Formerly, the case was different. The number of English was small, and the habits of society, therefore, uniform. Up to a certain date we are able to note, with tolerable accuracy, their mode of passing the time; but they now form a large, variously-constituted, and widely-dispersed community, and the same social differences are observed among them as we find at home. Early rising, however, is the general rule; many men being habitually on horseback before the sun is up. Breakfast is taken at all hours—from sunrise till eleven; and it varies from a cup of tea and a slice of dry toast, to a repast of rice, eggs, fish, cold meat, fruits, and preserves. From breakfast to five or six o'clock, the men of business, civil or military, toil in their sultry offices; while with others, and especially many of the female part of the community, the day is divided by tiffin—the substantial Indian lunch. Before tiffin is the time for paying and receiving morning visits; after that, a lady is her own mistress till her husband returns from business, and takes her out for a drive, or accompanies her carriage on horseback; or, wearied, vexed, and dispirited with the cares of the world, sends her forth to 'eat the air' alone. As for the *siesta* between tiffin and the drive, that has gone a good deal out of fashion. Men of business can no longer afford the time; and it has been discovered that sleeping in the daytime is merely an indolent habit, and not an indispensable of the climate.

The evening drive is the grand show of Calcutta. Hyde Park in full season is nothing to it. 'No sooner does the setting sun tinge the western horizon, than all the English residents in Calcutta throw open their doors and windows, make a hasty toilet, and sally forth, in carriage or on horseback, to enjoy the evening air. Before the sun has disappeared behind the western bank of the river, the strand is crowded with vehicles of every description—a concourse as dense as that which may be seen on the Epsom Road during the race-week, with even more entanglements and embarrassments, for there is a stream setting both ways. One marvels who all these people are that own these hundreds of carriages. The first impression made upon the mind of the stranger is, that there must be an enormous number of wealthy inhabitants in Calcutta. But the equipage is, in reality, no sort of index to the worldly possessions of the owner. It may let you, perhaps, into the secret of a man's vanity, certainly not of his income. Some of the most pretending equipages on the course are sported by people belonging to the second class of society—uncovenanted government servants, petty East

Indian or European traders—respectable personages enough in their way, and, peradventure, not much given to show; but the wife and the daughters must have their britska or barouche, though they do pinch a little at home to maintain it; and on the course at least, the wife of the uncovenanted subordinate may jostle the lady of the head of the office. When we consider how much is often sacrificed to support the dignity of the carriage and pair—how much substantial comfort is thrown aside to make room for this little bit of ostentation—that the equipage is with many the thing from which they derive much of their importance—we soon cease to wonder at the formidable array of assuming conveyances which throng the course every evening at sunset, and present a scene which, as one of daily recurrence, has not perhaps its parallel in the world.'

On the return from the drive, a late dinner winds up the day; at which the patriotic guests, with carpets beneath them, and curtains around them, determine to be European all over, and stew themselves in broad cloth! Formerly, white jackets were tolerated, and white trousers fashionable; but now, the greater the dinner or the ball, and the more stifling the crowd, the more indispensable is it for the English in India to dispense with everything adapted to the place and climate, and cover their persons with garments similar to those worn by the English at home.

Much of the improvement of manners and morals which has taken place within the last fifty years in India is owing, as has been said, to corresponding improvements at home, but something is also due to the influence of the press. A growing indulgence in the respectable literature of England is one of the most obvious engines of social advancement. 'We have more leisure in Calcutta for reading,' says a recent Anglo-Indian writer, 'than the majority of people in England who work for their daily bread. We are seldom called upon to consider the relative advantages of a new book and a country ride. We are so little out of doors, that books constitute our principal source of recreation; and new books are as plentiful in Calcutta—I speak of course with regard to the demands of the community—as they are in any town of England. Then there are our newspapers. Why, no man could possibly read them attentively, without making a tolerable acquaintance with the literature and science of the western world in all their rapidly-progressive stages.' But this is not the case in the capitals of the presidencies alone; for the remotest station has its book-club, furnished either from these cities, or from London direct; and there is hardly a regiment or detachment, either in cantonments or on the march, which is not provided with its library, and regularly supplied with newspapers and periodicals. 'Recently, indeed,' says the Calcutta Review, 'everything has been in our favour; and not the least of the many favourable circumstances which have tended towards the advancement of European literature in India, resides in the cheapness and portability of many works now issuing from the London press. Though we are now in the enjoyment of improved means of internal communication throughout the country, there are still many parts of India in which no great facilities for the conveyance of heavy parcels exist; and such conveyance, even under most favourable circumstances, is always attended with considerable expense. The treasures of regimental book-clubs are seldom overflowing; and there are not many private individuals who can set aside any very large sums for the purchase and the carriage of new books. India is therefore especially beholden to those enterprising publishers who have undertaken to reduce both the price and the bulk of the works they put in circulation.'

All this is so far good, but as we presume that Britain retains India as much for the benefit of the native races as for that of the mercantile and military classes of England, we hope the Calcutta reviewer will soon be able to give us an account of what is doing to elevate and improve that enormous native population of India

by the establishment of schools and otherwise. Until this is done, and done thoroughly, we shall view Hindoostan only in the light of an encampment—a country kept and domineered over only for the sake of plunder, all pretensions to the contrary notwithstanding.

HOWITT'S HOMES AND HAUNTS OF THE POETS.*

MR HOWITT, with good literary powers in himself, has that feeling for literature and literary men which seems necessary to one who would describe in a fitting manner the homes and haunts of the poets. He has accordingly produced out of this subject one of those works, lighter than history, graver than fiction, half-informing, half-emotional, which are now becoming the predominant books of the day. It is a beautifully-prepared book, with excellent wood-engravings, and some of those external elegancies which mark the Christmas publications. Like every other work of its author, it contains some free enunciations of opinion, which are apt to go gratingly over certain consciences; it is also not free from errors in small matters of fact; but, apart from these drawbacks—and what book can be wholly free from them?—we consider it as a most pleasant visitant, whether for the season, or for a permanency.

There are about forty poets noticed, three-fourths of whom are men of the last or present age. The selection is not wholly with a regard to the distinction of individuals, but partly with reference to the accident of there being something interesting to say about their homes or haunts. There is also much biographical and critical matter, the former necessarily not new. Geographical considerations have evidently been no obstruction to Mr Howitt. He has gone north to Deeside for the scenes of Byron's boyhood, and into the wilds of Ireland for the residences of Spencer and Goldsmith. On many occasions he seems to have travelled as a pedestrian with a knapsack, in quest of the places he required to visit. He mingled freely with the people on all occasions; drew from them their traditional reminiscences, and listened to their remarks, of which he has made liberal use in his book. It occurs to us—having experienced in the same kind of adventures—that Mr Howitt was at times unreasonable in expecting information from a humble class of people, and expresses a needless impatience under the disappointments he met with. The best intelligence about a person or an event is not always to be got exactly at the spot where the one lived or the other took place.

There is, nevertheless, some value in what Mr Howitt sets down with regard to those living near the homes of the poets. The general result is, that the common people are either grossly ignorant of the names and characters of the bright spirits which lived amongst them, or else have regarded them with prejudice. We are told, for example, of Wordsworth, Coleridge, and one or two other young literary men living harmlessly in studious retirement at Alfoxden, and being so much persecuted by the gross suspicions of their neighbours, as to be at last obliged to leave the place. Mr Howitt went down to Marlowe, to inquire after the residence of Shelley in that town, and had considerable difficulty in learning anything about the object of his inquiries; in this case it was not the humbler class of people alone who showed ignorance. We give some of his adventures in his own words.

It was in vain that I inquired amongst the class of

little gentry in the place for information about Shelley: they knew nothing of any such person. At length, after much research, and the running to and fro of waiters from the inn, I was directed to an ancient surgeon who had attended almost everybody for the last half century. I found him an old man of nearly ninety. He recollected Shelley; had attended him, but knew little about him. He was a very unsocial man, he said; kept no company but Mr Peacock's, and that of his boat, and was never seen in the town but he had a book in his hand, and was reading as he went along. The old gentleman, however, kindly sent his servant to point out Shelley's house to me; and as I returned up the street, I saw him standing bareheaded on the pavement before his door, in active discourse with various neighbours. My inquiries had evidently aroused the Marlowean curiosity. On coming up, the old gentleman inquired eagerly if I wanted to learn more yet about Mr Shelley? I had learned little or nothing. I replied that I should be very happy. "Then," said he, "come in, sir, for I have sent for a gentleman who knows all about him." I entered, and found a tall, well-dressed man, with a very solemn aspect. "It is the squire of the place," said I to myself. With a very solemn bow he arose, and with very solemn bows we sat down opposite to each other. "I am happy to hear," I said, "that you knew Mr Shelley, and can give me some particulars regarding his residence here." "I can, sir," he replied with another solemn bow. I waited to hear news; but I waited in vain. That Mr Shelley had lived there, and that he had long left there, and that his house was down the street, and that he was a very extraordinary man, he knew, and I knew; but that was all: not a word of his doings or his sayings at Marlowe came out of the solemn brain of that large solemn man. But at length a degree of interest appeared to gather in his cheeks and brighten in his eyes. "Thank God!" I exclaimed inwardly; "the man is slow, but it is coming now." His mouth opened, and he said, "But pray, sir, what became of that Mr Shelley?"

"Good gracious!" I exclaimed. "What! did you never hear? Did it never reach Marlowe—but thirty miles from London—that sad story of his death, which created a sensation throughout the civilised world?" No; the thing had never penetrated into the Boeotian denseness of that place! I rose up, and now bowed solemnly too. "And pray what family might he leave?" asked the solemn personage, as I was hastening away. "You will learn that," I said, still going away, "in the Baronetage, if such a book ever reaches Marlowe."

I hastened to the inn where my chaise was standing ready for my departure, and was just in the act of entering it, when I heard a sort of outcry, perceived a sort of bustle behind me, and turning my head, saw the tall and solemn man hastening with huge and anxious strides after me.

"You'll excuse me, sir; you'll excuse me, I think; but I *could* relate to you a fact, and I think I *will* venture to relate to you a fact, connected with the late Mr Shelley." "Do," said I. "I think I *will*," replied the tall stout man, heaving a deep sigh, and erecting himself to his full height, far above my head, and casting a most awful glance at the sky. "I think I *will*—I think I may venture." "It is certainly something very sad and agonising," I said to myself; "but I wish he would only bring it out." "Well, then," continued he, with another heave of his capacious chest, and another great glance at the distant horizon, "I certainly will mention it. It was this. When Mr Shelley left Marlowe, he ordered all his bills to be paid most honourably, certainly most honourably; and they were all paid—all—except—mine! There, sir! it is out; excuse it—excuse it; but I am glad it is out."

"What!—a bill?" I exclaimed in profoundest astonishment. "A bill! Was that all?"

"All, sir—all! Everything of the sort: every shilling. I assure you, has been paid but my little account, and

it was my fault: I don't know how in the world I forgot to send it in."

"What!" said I; "are you not the squire here? What are you?"

"Oh, Lord! no, sir! I am no squire here. I am a tradesman! I am—in the general way!"

"Drive on!" I said, springing into the carriage; "drive like the Dragon of Wautley out of this place—Shelley is remembered in Marlowe because there was one bill left unpaid!"

Perhaps there are reasons for this ignorance beyond what Mr Howitt thinks of. We shall say what occurs to us on the subject after quoting what will generally be felt as an interesting contrast—Mr Howitt's conversation with a poor elderly working-man, whom he fell in with on a Sunday forenoon, while walking from Ayr to the Burns scenery on Doonside. Our author having made an inquiry as to which of two ways led to Burns's monument, the face of his fellow-stroller kindled with an instant animation. "I am going part of the way, sir," he said, "and will be proud to show it you." I begged him not to put himself at all out of his way. "Oh," said he, "I am going to look at my potato plot, which lies out here." We fell into conversation about Burns: the way again showed a fresh branch—that was the way to his potato field; but the poor fellow gave a hesitating look; he could not find in his heart to give up talking about Burns, and begged that I would do him the honour to allow him to walk on with me. "But your potatoes, my friend?" "Oh, they'll tak no harm, sir: the weather's very growing weather. One feels a natural curiosity to see how they thrive, but that will do next Sunday, if you would allow me to go on with you?"

"I assured him that nothing would give me greater pleasure. I only feared that I might keep him out too long, for I must see all about Burns's birthplace, Kirk Alloway, the Brig of Doon, the monument, and everything of the kind. It was now about noon, and must be his dinner hour. He said "No; he never had dinner on a Sunday; for years he had accustomed himself to only two meals on that day, because he earned nothing on it, and had ten children! But he generally took a walk out into the country, and got a good mouthful of fresh air, and that did him a deal of good."

"I looked more closely at my new companion. He was apparently sixty, and looked like a man accustomed to dine on air. He was of a slight and grasshopper build; his face was thin and pale; his hair grizzled; yet there was an intelligence in his large gray eyes, but it was a sad intelligence—one which had long kept fellowship with patience and suffering. His gray coat, and hat well worn, and his clean but coarse shirt-collar turned down over a narrow band of a blue cotton neckerchief, with its long ends dangling over his waistcoat, all denoted a poor, but a careful and superior man. I cannot tell what a feeling of sympathy came over me, how my heart warmed towards the poor fellow. We went on. Gay groups of people met us, and seemed to cast looks of wonder at the stranger and his poor associate; but I asked myself whether, if we could know, as God knows, the hearts and merits of every individual of those well-dressed and laughing walkers, we should find amongst them one so heroic as to renounce his Sunday dinner, as a perpetual practice, because he "earned nothing on that day, and had ten children." Was there a man or a woman amongst them who, if they knew this heroic man, as I now knew him, would not desire to give him, for that one day at least, a good dinner, and as much pleasure as they could?

"My friend," said I, "I fear you have had more than your share of hardship in this life?"

"Nay," he replied, he could not say that. He had had to work hard, but what poor man had not? But he had had many comforts; and the greatest comfort in life had been, that all his children had taken good ways; "if I don't except," and the old man sighed, "one lad who has gone for a soldier; and I think it a

little ungrateful that he has never written to us since he went, three years ago. Yet I hear that he is alive and well in Jamaica. I cannot but think that rather ungrateful," he added; "but of a Robin Burns's poems, there's none, to my thinking, that comes up to that one—'Man was made to mourn.'"

"I could not help again glancing at the thin pale figure which went as softly at my side as if it were a ghost, and could not wonder that Burns was the idol of the poor throughout Scotland, and that the Sunday wanderer of his native place had clung so fondly to the southern visitor of the same sacred spot.

"Can you explain to me," I asked, "what it is that makes Burns such a favourite with you all in Scotland? Other poets you have, and great ones. Out of the same class, too, you had Hogg, but I do not perceive the same instant flash, as it were, of an electric feeling when any name is named but that of Burns."

"I can tell," said he, "why it is. It is because he had the heart of a man in him. He was all heart and all man; and there's nothing, at least in a poor man's experience, either bitter or sweet, which can happen to him, but a line of Burns springs into his mouth, and gives him courage and comfort if he needs it. It is like a second Bible."

"I was struck with the admirable criticism of the poor artisan. What acuteness of genius is like the acuteness of a sharp experience after all!"

With one remark on Mr Howitt's friend, that he was but a type of a whole genus of toiling, self-denying poor in our land—too often laughed at as over-cautious and frugal, when they are only just and independent—we pass on to say that one cause of the difference between Marlowe and Ayr may be in what Mr Howitt himself unconsciously suggests—that such writings as those of Shelley have not that adaptation to common feelings and common necessities and sorrows which belongs to those of Burns. Burns was, in fact, one of a thousand among the poets, in the fact of his having written *for the people*. It is not, therefore, wonderful to find the remainder of the thousand comparatively little known.

Mr Howitt has been at unusual pains with the localities of poor Goldsmith, notwithstanding that Mr Prior, his biographer, has gone over and described everything most carefully. The *Auburn* of the 'Deserted Village' is the hamlet of Lissoy, near Kilkenny West; yet not exactly so, for the poet, to give his poem greater currency, adopted many traits of the villages of England into his description of an Irish hamlet. The place really had been depopulated and rooted out, as happens with villages every day in Ireland; but the celebrity of the poem afterwards caused a Mr Hogan to re-erect it in part, including the public-house, which is perhaps the most *English* article in the whole description. Mr Hogan 'rebuilt the public-house, on the spot where tradition placed the old one, with the traditionary thorn in front. He gave it the sign of "The Jolly Pigeons;" he supplied it with new copies of "The Twelve Good Rules," and "The Royal Game of Goose;" he went even to the length of the ludicrous in his zeal for an accurate *fac-simile* of the genuine house—and

"Broken tea-cups, wisely kept for show,
Ranged o'er the chimney, glistened in a row."

These, to perpetuate them, were fast imbedded in the mortar; but in vain. Relic-hunters knocked them out, fictitious as they were, and carried them off as genuine. The very sign did not escape this relic mania. It is no longer to be seen; nor, I suppose, were a new one to be set up, would it long remain. The new "Twelve Good Rules," and new "Royal Game of Goose," have gone the same way; and there is no question that a brave trade in such things might be carried on with what Goldsmith calls "the large family of fools," if a supply were kept here. The very thorn before the door has been cut down piecemeal, and carried off to all quarters of the world. The house is wholly unlike the proto-

type in the poem. 'The "Jolly Pigeons" is just a regular Irish alehouse, or rather whisky-shop. On going in, you look in vain for the picture Goldsmith has so beautifully drawn. The varnished clock clicking behind the door, the pictures placed for ornament and use, the twelve good rules, the royal game of goose, where are they? Not there, but in many an old-fashioned hamlet of England. The mud-floor, the dirty walls, the smell of whisky, these are what meet you. You look for the "parlour splendours," and on your left hand there is, for a wonder, a separate room; but it is, as usual, filled with the candles, the herrings, the bread of the Irish alehouse; and the whisky is doled out over the suspicious counter, instead of the nut-brown ale being brought in the generous foaming cup to the bright clean fireside by the neat and blooming maid.'

After some remarks on the still continued practice of depopulation, Mr Howitt thus proceeds:—'Under all these circumstances, Auburn or Lissoy, which you will, will always be visited with enthusiasm by the genuine lovers of purest poetry and of kindly humanity. The visitor will not find all there that he naturally looks for. He will not find the country very beautiful, or the mill, the brook, the alehouse, as rural and picturesque as he could wish; but he will find the very ground on which Oliver Goldsmith ran in the happy days of his boyhood, the ruins of the house in which that model of a village preacher—simple, pious, and warm-hearted, justly, indeed, dear to all the country—lived, the father of the poet; the ruins of the house in which the poet himself spent a happy childhood, cherishing under such a parent one of the noblest spirits which ever glowed for truth and humanity—fearing no ridicule, contracting no worldliness; never abating, spite of harsh experience and repeated imposition, one throb of pity or of generous sympathy for the wretched. . . . Every circumstance connected with the "Deserted Village" of such a man will always be deeply interesting to the visitor of the spot, and we must, for that reason, notice one or two facts of the kind before quitting Lissoy. Mr Best, an Irish clergyman, met by Mr Davies in his travels in the United States, said, "The name of the schoolmaster was Paddy Burns. I remember him well. He was indeed a man severe to view. A woman called Walsey Cruse kept the alehouse. I have often been in the house. The hawthorn bush was remarkably large, and stood opposite the house. I was once riding with Brady, titular bishop of Ardagh, when he observed to me—"Ma foy, Best, this huge overgrown bush is mighty in the way: I will order it to be cut down!" "What, sir!" said I, "cut down Goldsmith's hawthorn bush, that supplies so beautiful an image in the Deserted Village!" "Ma foy!" exclaimed the bishop, "is that the hawthorn bush? Then ever let it be sacred from the edge of the axe, and evil to him that would cut from it a branch!"'

'In other places the schoolmaster is called, not Paddy Burns, but Thomas Byrne, evidently the same person. He had been educated for school teaching, but had gone into the army, and serving in Spain during the reign of Queen Anne, became quartermaster of the regiment. On the return of peace he took up his original calling. He is represented to be well qualified to teach; little more than writing, reading, and arithmetic were wanted, but he could translate extemporaneously Virgil's *Eclogues* into Irish verse in considerable elegance. But his grand accomplishment was the narration of his adventures, which was commonly exercised in the alehouse; at the same time that, when not in a particular humour for teaching, he would edify his boys in the school with one of his stories. Amongst his most eager listeners was Oliver, who was so much excited by what he heard, that his friends used to ascribe his own love of rambling to this cause. The schoolmaster was, in fact, the very man to raise the imagination in the young poet. He was eccentric in his habits, of a romantic turn, wrote poetry, was well-versed in the fairy superstitions of the country, and, what is not less common in Ireland, believed implicitly in their truth.

'A poor woman named Catherine Geraghty was supposed to be

—"Yon widowed, solitary thing,
That feebly bends beside the plashy spring:
She, wretched matron, pressed in age for bread,
To strip the brook with mantling creases spread."

The brook and ditches near where her cabin stood still furnish creases, and several of her descendants reside in the neighbourhood. The school-house is still pointed out; but it is unfortunate for its identity that no school-house was built then, school being taught in the master's cottage. There is more evidence in nature of the poet's recalling the place of his boyhood as he wrote his poem. The waters and marshy lands, in more than one direction, gave him acquaintance with the singular bird which he has introduced with such effect, as an image of desolation—

"Along thy glades, a solitary guest,
The hollow-sounding bittern guards its nest."

Little charm as Lissoy has at the present moment, independent of association with Oliver Goldsmith, with him and genius it possesses one that grows upon you the more you trace the scenes made prominent in his poem, and we leave it with regret.

Amidst the sentiments scattered through this book are many in which we cannot sympathise. Some, however, are noble and beautiful—as, for example, the following, which occurs after a quotation from 'Thomson's Seasons':—"It is the grand defect of our systems of education, for rich and for poor, but pre-eminently for the former, that it is not taught that no man can live innocently who lives only for his own enjoyment; that to live merely to enjoy ourselves is the highest treason against God and man; that God does not live merely for himself, his eternal existence is one constant work of beneficence; and that it is the social duty of every rational being to live like God his Creator, for the good of others. Were this law of duty taught faithfully in all our schools, with all its responsibilities, the penalties of its neglect, the ineffable delight of its due discharge, there would be no longer seen that moral monster, the man or woman who lives alone for the mere purpose of selfish enjoyment. That host of gay and idle creatures who pass through life only to glitter in the circles of fashion; to seek admiration for personal attractions and accomplishments—for dressing, playing, dancing, or riding—whose life is but the life of a butterfly, when it should be the life of a man, would speedily disperse, and be no more seen. That life would be shrunk from as a thing odious and criminal, because useless, when faculties, wealth, and fame are put into their hands, and a world is laid before them in which men are to be saved and exalted; misery, crime, shame, despair, and death prevented; and all the hopes and capacities for good in the human soul are to be made easy to the multitude. To live for these objects is to be a hero or a heroine, and any man or woman may be that; to live through this world of opportunities given but once, and to neglect them, is the most fearful fate that can befall a creature of eternal responsibilities.'

Mr Howitt indulges in some fierce outbursts against critics—he had better let these gentlemen alone. After all, a critic is but a literary man in a certain position, or undertaking a certain duty. The general inducements for his doing this duty conscientiously, and to the best of his judgment and power, are as great as these are in any other department of literature. If he fails in many instances, do not men fail in other tasks as well? Our author is often misled, too, by what appear to us as singular prejudices. For example, he rails at universal England for not endowing the descendants of Shakespeare's sister! Alas! how many duties more pressing and practical has England failed in! How vain, then, the denunciations on such a subject!

In the article on Wordsworth, Mr Howitt gives a view of that gentleman's poetry, which will startle many of his young worshippers. 'It is,' says our

author, 'simply a poetic Quakerism. He [the quaker] believes that if he "centres down," as he calls it, into his own mind, and puts to rest all his natural faculties and thoughts, he will receive the impulses and intimations of the Divine Spirit. He is not to seek, to strive, to inquire, but to be passive and receive. This is precisely the great doctrine of Wordsworth as it regards poetry. He believes the Divine Spirit which fills the universe to have so moulded all the forms of visible nature, as to make them to us perpetual monitors and instructors.' Thus in the poem, 'The Tables Turned,' this doctrine is announced. 'The poet calls his friend from his books, as full of toil and trouble, adding—

"And hark! how blithe the throstle sings!
He, too, is no mean preacher:
Come forth into the light of things,
Let nature be your teacher."

She has a world of ready wealth
Our minds and hearts to bless—
Spontaneous wisdom breathed by health,
Truth breathed by cheerfulness.

One impulse from a vernal wood
May teach you more of man,
Of moral evil and of good,
Than all the sages can.

Sweet is the lore which nature brings;
Our meddling intellect
Misshapes the beauteous forms of things:
We murder to dissect.

Enough of science and of art;
Close up their barren leaves;
Come forth, and bring with you a heart
That watches and receives."

'Wordsworth tells us that to this practice of quitting men, books, and theories, and seeking communion with nature, he owes

"A gift
Of aspect most sublime: that blessed mood
In which the burden of the mystery,
In which the heavy and the weary weight
Of all this unintelligible world
Is lightened: that serene and blessed mood,
In which the affections gently lead us on,
Until the breath of this corporeal frame,
And even the motion of our human blood,
Almost suspended, we are laid asleep
In body, and become a living soul.
While with an eye made quiet by the power
Of harmony, and the deep power of joy,
We see into the life of things."

'This is perfect Quakerism; the grand demand of which is, that you shall put down "this meddling intellect, which misshapes the beauteous forms of things;" shall lay at rest the actions and motions of your own minds, and subdue the impatience of the body, till, as Wordsworth has most clearly stated it—

"The breath of this corporeal frame,
And even the motion of our human blood,
Almost suspended, we are laid asleep
In body, and become a living soul."

There is much more to this purpose—the passage is altogether a remarkable one. 'The poet and the Friends agree,' we are told, 'that there is a power seated in the human soul superior to the understanding, superior to the reasoning faculty, the sure test of truth, to which every man may confidently appeal in all cases, for it is the voice of God himself. With the poet and the Friends the result of this divine philosophy is the same—the most perfect patience, the most holy confidence in the ever-present Divinity; connected with no forms, no creeds, no particular conditions of men; not confined by, not approachable only in temples and churches, but free as his own winds, boundless as his own seas, universal as his own sunshine over all his varied lands and people; whispering peace in the lonely forest, courage on the seas, adoration on the mountain-tops, hope under the burning tropics and the blistering lash of the savage white man, joy in the dungeon, and glory on the deathbed.'

If truth is to be learnt in this way, what is the use

of the inductive philosophy? We suspect, however, that the truth of feeling, not the truth of fact, is meant by the votaries of this system, or at least that beyond that point it is but a dream.

WAITING FOR A COMMISSION.

BY AN IRISHMAN.

IDLENESS, they say, is the parent of all evil. If the proverb be a true one—and few, I think, will be disposed to doubt it—there is then a sufficient reason why this green isle of ours should be one of the most vicious countries in the world; for certainly in no other under the sun are so many genuine idlers to be found, young men especially. Living on their 'expectancies,' they go on from day to day—from boyhood to youth, and from youth to manhood—existing, nobody knows how, and looking forward to, nobody can tell what. In other lands, parents educate and bring up their children with some definite pursuit in view. Here, it is different. Fathers and mothers trust to chance, as though it were the surest possible source of provision for their families. One man depends upon his own interest, another upon that of his wife. One has a twenty-first cousin deputy something or other in a government office. A second is connected by marriage with a lord (people in Ireland think a lord can do anything and everything). A third was a schoolfellow of the lord chancellor, or a college companion of the attorney-general. A fourth served in the militia. A fifth gave the casting vote at a contested election: and the great-grandfather of a sixth did something wonderful a hundred years ago.

Thus each and all have, or imagine they have, a certainty of one at least of their offspring being provided for; and thus they bring them up in idleness, having given them an education, to get on hereafter as they best may—upon their 'expectations.' The consequence is, that idlers are to be found wherever you go. There is no circle without them—no family, from the peasant's to the peer's, but can reckon one or more of them amongst its members or connexions.

These idlers are of various grades, according to their different degrees of respectability, or perhaps I should rather say according to the rank of life in which each is born and moves. Some look forward to one thing, some to another. There is no situation in the empire, from the treasury to a tide-waitership, but has at least a hundred pair of expectant eyes watching eagerly for a vacancy. The grand object, however, is a commission in the army—that is the great end and object of an Irishman's ambition. It is really astonishing how numerous are these would-be heroes; and I verily believe that if but one-half the youth of Ireland who are at this moment wasting their time and talents in the unprofitable pursuit of 'waiting for commissions,' were at once to obtain the thing they seek, an army would be created, of officers alone, sufficient to carry conquest throughout the world. I know not whether it be owing to the martial spirit of her sons, or the degree of admiration bestowed upon red-coats by her daughters, but it is an undeniable fact, that the thing I speak of is a perfect passion in Ireland, and that, let the cause be what it may, at least a moiety of our 'respectable' young men set the first wishes of their hearts upon entering the army.

You go to a dinner-party or a ball, and meet a good-looking, well-dressed, gentlemanly fellow, who knows everybody, and is up to everything in the ring. From the turf to the drawing-room, from the kennel to the library, his conversation ranges. With the details and *matériel*

of each and all you find him intimately acquainted—nothing is too grave, nothing too gay for him—he is never for a single moment at a loss. You wonder who this 'Admirable Crichton' may be, or what his calling, and you ask the question. In ninety cases of every hundred you are told—'A highly respectable young man—waiting for a commission!'

Well, you turn from him to your neighbour on the left—a pale, delicate-looking student, who has evidently 'wasted the midnight oil' to some purpose. He discourses eloquently upon the beauties of the classic poets, has been a successful digger amongst Greek roots, and written the last prize essay. Your admiration has a shade of pity as you look at his attenuated form, and listen to his short dry cough. Who, and what is he? An embryo lord chancellor perhaps? or at all events a deep-reading college man, looking forward to the honours of a senior fellowship? By no means—you are quite mistaken. Despite his weakly frame and consumptive look, 'his voice is still for war,' he is—'waiting for a commission!'

Slightly disappointed, you leave the dinner-table, and betake yourself to the drawing-room. Seated upon a sofa, in an attitude of studied gracefulness, is a middle-aged gentleman, dressed in the pink of fashion, and who is reputed the best waltzer in the county. At present he is delighting a bevy of young ladies with his chat. Surely he is a nobleman, or great landed proprietor at the least? Quite a mistake; you don't know Ireland! He is a younger son, who never did anything useful all his life; he lives with his brother, and is in debt to everybody. For twenty years he has been—'waiting for a commission!'

You go to the theatre with a friend, and he introduces you to a talented-looking personage, with a broad forehead and a bright eye, who dilates with all the critic's art upon the play and the performers, and who, if your taste happen to lie in that direction, quite fascinates you by the happiness of his illustrations and the classic purity of his ideas. You wonder who the gifted one can be—whether a distinguished reviewer, a dramatist, or something still higher in the literary world; and on your way home you make the inquiry of your friend. The answer is given, and astounds you—'A fellow with capital interest—"waiting for a commission!"'

And so on to the end of the chapter. You can go into no society without meeting at least one specimen of the class; and I defy any one who has lived amongst Irishmen to say that he is not acquainted with a score of expectant youths—'waiting for commissions!'

This same fatal passion of *waiting*—of forsaking the substance for the shadow, and pursuing an *ignis fatuus* instead of keeping the eye fixed upon a steady beacon-light—has been the ruin of many a fine, gifted youth, and has left many a broken-hearted man, who might else have been an honour to his name and country, to spend the remnant of his life in vain repinings for his mispent youth, and to weep, when regret is useless, for opportunities neglected, and talents misapplied.

It is hard, certainly, to put gray heads upon young shoulders, or to persuade light-hearted, unthinking youth to reap wisdom from the counsels and experience of those more advanced in years; but, even making full allowance for this, is it not a pitiable thing that, for generation after generation, and utterly disregarding the thousands and tens of thousands of examples proving the fatal folly of such a course, young men will go on pursuing the same misleading path with a degree of obstinacy and moral blindness which seems incomprehensible?

'Waiting for commissions,' and for many other things, has left Irishmen as they are. Procrastination, the

proverb says, is the thief of time—it might be added, and the curse of Ireland. Putting off until to-morrow that which might be done to-day, and seldom looking forward to the day after, we go on 'waiting'—always 'waiting,' and never 'doing'—in the hope that 'something may turn up' for us in the long-run; and so we get through life. Those amongst us who are not commission-seekers, are seekers for something else; but in all cases, at least in all cases where 'expectations' are indulged in, the *spirit* is the same. And a paltry, pitiful spirit it is, even make the best we can of it. The true manly spirit is one of self-dependence—no trusting to patronage, no cringing for favours, no servile bending of the knee to sue to a 'dog in office' for a boon; but a strong and honest determination to push on our fortunes with our own talents and our own hands, and bravely to fight our own battle with the world 'without fear and without reproach.' This is the spirit which has led our best and bravest to their fame, and which is still ready to lead others, if they would but follow it.

It is not by 'waiting' that fortune can be wooed or distinction won. It is not by lingering on from day to day, and from year to year, enduring the corroding miseries of that 'hope deferred which maketh the heart sick,' and wasting our prime of life in grasping at a phantom, until hope itself at last deserts us, and leaves us, in the bitterness of our ruined prospects, to lament the evil fortune which, by an effort, we might have changed to good. We must lay our shoulders to the wheel, and *work*. 'Up and be doing!' should be our motto, in whatever rank of life our lot is cast.

If expectations from the army are usually visionary, those from the civil service are no better. Even if successful, what has the employé but a clerkship in a government office, at a salary of eighty pounds per annum, or an appointment in some of the colonies, where, if he escape cholera and yellow fever, he is sure of a life of healthless discomfort? If less fortunate in drawing a prize, perhaps the youth is made an excise officer or a tide-waiter. Trust me, my young friends and fellow-countrymen, that until you get out of this habit of 'waiting,' Ireland will never be as she ought to be, nor her sons what they might be. You have energy enough, if properly applied—you have talents second to the children of no other land on earth—you have bold hearts and ready hands, if you would but use them. Why, then, should you waste your youth, your best gifts, and oftentimes your happiness itself, in 'waiting' for paltry chances, when you have within your own grasp the power to *command* the bright reality?

Many fields are open to you where your energies would have fair-play. You may be told that every profession is overstocked. Believe it not; you have the same prospect of pushing your way to fame as any of your neighbours. 'The will to do, the soul to dare,' are all that is required. Patience, perseverance, and determination, can achieve everything. Instead of 'waiting'—act. If circumstances are against your entering one of the professions, then take a *trade*. Let no false pride deter you. Set at nought the sneers of those who tell you it is not 'respectable:' a man by his own conduct can make any situation respectable: bread earned in honesty is earned in honour; and he who labours for his daily food, preserving his integrity the while, has a better right to hold his head erect among his fellow-men—ay, a far better right—than the proudest in the land who lead a life of indolence and sloth. Whatever your rank in life may be, make choice of your path accordingly; but 'wait' for nothing and for nobody. Rely upon yourself, and upon yourself only. Have the means of existence in your own hands—go to work with head and heart; and depend upon it, that however adverse circumstances may depress you for a time, you will surely in the end come off a conqueror.

Look around you at the 'waiters.' What is most commonly their lot? After lingering on from day to day and year to year 'expecting,' recklessly squandering the best gifts that Heaven can bestow on man, and

living the while nobody can tell how, they end an inglorious career of idleness, uncared for by a world to which, from their infancy upwards, they have been only an incumbrance.*

VITAL STATISTICS OF EDINBURGH.

IN our populous cities as now constituted, in order that the community at large may enjoy anything like an average lease of healthy existence, life must be to a certain degree an art. When human beings live scattered over the country, fresh air, ventilation, and out-of-door exercises come as matters of course, with many other natural advantages; but when they are huddled together in narrow, close, and dark streets and alleys—when their labours confine them to ill-aired apartments, and expose them to noxious fumes and vapours, the case is then very much altered, and the essential requisites of a healthy existence must then be sought for and procured by scientific foresight. Nothing perhaps will tend more to impress these truths on the public than accurate statistical details. Until of late years, however, these have not been very available for this purpose; but now that the subject has been taken up by government, the English bills of mortality have thrown much light on the sanitary state of the country. An interesting report, by Dr Stark of Edinburgh,† enables us to draw a comparison between the vital statistics of the two portions of the kingdom north and south of the Tweed, while at the same time the report affords some highly important facts bearing on the subject of the health of large towns in general.

The city of Edinburgh as its situation presents many local advantages. It is built on three hills or elevated ridges, and is thus exposed to complete ventilation even by the slightest breeze that blows; the sloping nature of the ground on all sides permits of ready drainage; and its proximity to the sea insures a generally mild and soft air. It has comparatively few manufactories, and thus its atmosphere is less clouded or vitiated with smoky vapours than many of the manufacturing towns of the empire. However low its former fame for cleanliness, it now possesses an excellent police, who keep its streets in a cleanly condition. The houses and general accommodation of the higher and middle classes are of the best description, though those of the lower, and especially of the very lowest, are far from being so, and are often of the most wretched kind. The supply of water, though at one time plentiful, is not now adequate to the increased extent of the city, and is especially deficient as regards the lower classes, and the healthy ablution of the narrower streets and alleys.

The population of Edinburgh, which at the commencement of the present century was computed at sixty-nine thousand, had in thirty years doubled, being, according to the census of 1831, one hundred and thirty-nine thousand; for the next ten years the increase was so exceedingly small, as to be in 1841 only one hundred and forty thousand, or nearly stationary. The great increase of population between the years 1800 and 1831 is to be accounted for from the immigration of strangers from other parts, and particularly to the great influx of the lower Irish. The presence of these latter has to a considerable degree influenced the habits of the lower population, and affected the general vital statistics of the community.

One obvious means of ascertaining the comparative salubrity of a town or district, is to take the number of persons living in it who have attained the age of sixty years and upwards. On consulting the returns, we

accordingly find that, taking the whole of England and Wales, there are in every thousand living persons 71 who are upwards of sixty. In Scotland there are 69, in Bristol 69, in Edinburgh county 63, in the city 62, whereas in London there are 60, in Birmingham 50, in Manchester 47, in Glasgow 42, and in Liverpool 30. In all manufacturing towns there exists a greater proportion of children and of adults than in a non-manufacturing town—of children, because the parties marry early; of adults, because the neighbouring rural districts are partially drained to supply the demand for labourers; and in an increasing population there is frequently an excess of persons between the ages of fifteen and sixty. As a general rule, rural districts exhibit the largest proportion of children and the greatest proportion of aged, because the causes of mortality among children are less than in towns: more children are therefore reared, and more attain an advanced age.

But a more accurate plan of ascertaining from population returns alone the comparative healthiness of a town or country, is to strike off altogether from the existing population the children below fifteen years, and ascertain the proportions which those above sixty bear to the whole population above fifteen years of age. When this is done, we find that in every thousand of the population above fifteen, there are in England and Wales 122 above sixty, in Scotland 116, in Bristol 99, in Edinburgh county 95, in the city 92, in London 87, in Birmingham 78, in Manchester 72, in Glasgow 62, in Liverpool 61. It thus appears that in these returns Edinburgh holds a very favourable position, being more highly favoured than any town of equal size in England. Dr Stark next shows from an elaborate table the average annual mortality of the city of Edinburgh for a series of years. From this table it appears that from the year 1780 to 1789, 1 person died annually out of every 34 living; from 1790 to 1799, 1 died annually out of every 36 living; from 1800 to 1809, there died annually 1 out of every 39 inhabitants; and from 1810 to 1819, only 1 out of every 40 living. The next decennial period, from 1820 to 1829, shows, however, a retrograde movement, the mortality increasing to 1 out of every 38 inhabitants annually; while the next ten years exhibit a mortality of 1 in every 34 living. The progressive elongation of life during the earliest of the above periods may be attributed to the great improvements of the extending city, and other advances of civilisation. Dr Stark is inclined to attribute the subsequent retrogression to the immigration of great numbers of Irish labourers about the year 1819, and the consequent deterioration of the lowest class of labourers generally. During the period between 1830 and 1840, the mortality was increased by 1500 annually, in consequence of the prevalence for some time of Asiatic cholera, influenza, and other epidemics.

Another very important circumstance in the comparative healthiness of different localities, is that regarding the number of young people, from one to fifteen years, found existing in each. Thus we shall find that out of 1000 persons who die in Edinburgh, there are under fifteen years of age 413; in London, under the same circumstances, there are 471; in all England and Wales, 473; in Bristol, 474; in Birmingham, 546; in Glasgow, 564; in Manchester, 564; in Liverpool, 583. These facts exhibit in a striking light the superior salubrity of Edinburgh as a place of residence for children, seeing that at all ages under fifteen the proportion of deaths is much less than in any other of the places mentioned, even exceeding that of England and Wales, which of course includes the country districts, in which the mortality among children is always much less than in towns. If, on the other hand, we take the comparative proportion of aged, or those who die above sixty years in every 1000 deaths in a population, we shall find that in London, out of every 1000 deaths, there are 206 of them above sixty; in Edinburgh, 204; in Bristol, 198; Birmingham, 159; Manchester, 130; Glasgow, 129; Liverpool, 112. From these facts, the ge-

* The above article is, as it purports to be, written by a native of Ireland, who has given some consideration to the social features of his country. Although not mentioning what we consider to be the root of Irish idleness—the unhappy coddling by England, scarcely avoidable in the existing connexion of the two countries—he says enough to corroborate the view lately adopted by us respecting Irish affairs.—Ed. C. E. J.

† Edinburgh Medical Journal, January 1847.

neral proposition may be deduced, that, other things being equal, the less the proportion of deaths among children under fifteen, and the greater the proportion of deaths above sixty, the greater will be the healthiness of the situation. With regard to the adult population, Dr Stark thus remarks—'As deaths among children are proportionally much fewer in Edinburgh than among the other towns, we ought to find a proportionally greater number of deaths among adults. This may to many seem a paradoxical conclusion, but the slightest reflection must satisfy every one that such ought to be the case. As a third more children, in proportion to the living, survive the age of fifteen years in Edinburgh than in Glasgow, and one-half more survive that age than in Liverpool, it follows, as a natural consequence, that there are just so many more in Edinburgh who must die at some period of life after their fifteenth year. Now, this is what actually occurs; for we find that of those between the ages of fifteen and sixty, London loses 1 annually out of every 80 living; Birmingham, 1 out of 75; Glasgow, 1 out of 71; Edinburgh, 1 out of 65; Liverpool, 1 out of every 61. Under these circumstances, it becomes a matter of great importance to ascertain whether the increased mortality affects all classes alike, or is limited to the lowest class of the inhabitants. We accordingly find that, in the case of children under one year, the highest class in Edinburgh loses 72 out of every 1000 deaths in that class. The merchant class at the rate of 127 out of the 1000 deaths; while the artisan and labouring classes lose 241 out of every 1000 deaths at all ages. That is to say, that the merchant class loses annually very nearly double the proportion of children under one year which the gentry and professional class lose; while the artisan and labouring class lose annually four times the proportion of children under one year lost by the first class, and double that lost by the merchant class. When the total deaths under fifteen years are reckoned, it is seen that the highest class out of every 1000 deaths lose 204; the second class, 326; and the lowest class, 483. Thus it is apparent that, while among the first class there dies less than half the proportion of children under fifteen years, as compared with the deaths among the third class, these deaths are more equally distributed over the fifteen years of life, and do not cluster around the first year of existence as they do in the lowest class. And this is just what might be expected. Of the lowest classes, the strong alone survive the first year or years of existence; all the delicate are cut off, so that in consequence of this, and of there being fewer left alive, the proportional number of deaths diminishes as life advances. Of the highest class, again, so many more are reared—so many delicate children get over the first year of life, that more are spared to die at a more advanced period of existence. As the natural consequence of this increased mortality of the lowest classes during childhood, they show a less proportional mortality during the adult period; and thus arises the fact already alluded to, that in Edinburgh and some other towns the mortality of the adult population appears greater than in towns and localities less healthy.

Another view of the relative mortality of the different ranks of life may be taken by a table of deaths above fifteen years of age. Thus, of 1000 of the first class above fifteen years of age, 481 die between the ages of fifteen and sixty, leaving 519 to be cut off at an advanced period of life. Of 1000 of the second class above fifteen years of age, 594 die between the ages of fifteen and sixty, leaving 406 to die at a more ripe age. Of 1000 of the third class, however, above fifteen years of age, no fewer than 606 die between the ages of fifteen and sixty, leaving only 394 to die at periods above sixty years of age. The mean age at death of the different classes is thus stated—First class, 47·22 years; second class, 36·58 years; third class, 25·88 years.

How heavily does mortality bear upon the lowest class here! Yet, compared to other places, even here

Edinburgh has the advantage. In London, the mean age at death among the operative class is twenty-two years; in Edinburgh, even including the paupers, it is nearly twenty-six years. In London, the mean age at death of the highest class is forty-four years; in Edinburgh, it is forty-seven. Strange enough, however, it is from the poorest class that we can select the cases of extremest age. Thus, of the first class, though 99 out of the 1000 survive their eightieth year, all have died by the time the hundredth year is attained. Though only 59 of the second class survive their eightieth year, 1 of them survives the hundredth year of existence; while in the third class, though only 26 live beyond their eightieth year, 2 are still living above one hundred years. In Edinburgh, as we believe is the case all the world over, the married, both males and females, enjoy longer life than the single. Thus the mean age at death of the married females is fifty-seven years, of the single forty-two years; showing a difference in favour of the married females to the extent of fifteen years: the difference in regard to males is even eighteen years!

Of the physical causes which appear to weigh so heavily against the poorer classes, the following are the most obvious:—Accumulations of filth within and around their dwellings; want of drainage or sewerage, or, where sewers are present, their unwholesome state, from the presence of fetid black mud closing up the sewers and cesspool; closeness and want of proper ventilation within the houses; crowding of families into the same confined chambers; want of proper supply of water; prevailing habits of intemperance, mainly produced and kept up by the want of all comforts at home; retaining the corpses of the dead in the apartment occupied by the living.

Of the effect of ill-constructed drains and sewers in individual houses on the health of the inmates, Dr Stark gives several very striking examples which occurred in the middle ranks of life, and he strongly recommends a more improved system of domestic sewerage.

With these abatements, which are in general common, in a greater or less degree, to all our large towns, Edinburgh appears, on the whole, to stand at the head of the cities and towns of the kingdom in respect to salubrity. In particular, it seems especially favourable to the health of the young; and this is a matter of the greatest importance, considering that it is a chief seat of education, where the young of both sexes, and from all parts of the country, resort for mental training. With all its advantages, however, the above statements show how very much the health and longevity of the mass of the people depend on the state of the streets and houses, and all those arrangements which come under the denomination of general police, and how much yet remains of judicious reform in this department to render the poorer classes as comfortable as they ought to be.

PARTNERS FOR LIFE.

BY CAMILLA TOULMIN.*

THE age of guinea annuals is at its close; and these expensive toys, with their steel engravings and sumptuous covers of leather, silk, or velvet, are almost entirely superseded by five-shilling volumes, bound in cloth, and illustrated by woodcuts. This is in some sense matter of gratulation; but not because the one book is, economically speaking, cheaper than the other—for the very reverse is the case. The guinea annual was a most daring speculation. The letter-press did not cost less than from L.200 to L.250; the eighteen or twenty drawings averaged perhaps L.15 each, and the good engravings perhaps L.30 each; while the binding alone absorbed a very considerable portion of the selling price. For one engraving in the 'Souvenir,' Mr Alaric Watts paid L.150; and in addition to all ordinary costs, Mr Charles Heath defrayed liberally the travelling

* With illustrations by John Absolon. Orr: London.

expenses in foreign countries both of author and artist. Employed by this gentleman for the purpose of getting up the letter-press and illustrations of one of those volumes, Mr Leitch Ritchie and the late Mr Vickers spent several months in travelling in Russia, extending their wanderings beyond Moscow. The guinea annuals, therefore, were, and such of them as still survive are, cheaper in proportion to their cost than the five-shilling annuals, while they have the further merit of improving the taste of the upper classes in point of art. They are now, however, 'dreeing their weird' just like other books. Fewer people can afford a guinea, and more people a crown, than formerly; and so Mr Dickens, Mrs Gore, Miss Toulmin, and various others, have started up, in the inevitable nature of things, to shove their predecessors from their stools.

We do not put forward Miss Toulmin's volume as the five-shilling volume of the year. It has its own merits and defects like the rest, although, in pure and high feeling, and thorough home-heartedness, it can have no superior; but we know our readers will look upon it with peculiar interest, as the production of one from whom they have so frequently received, in our own columns, both amusement and instruction. 'Partners for Life' is a story of the home affections, quiet—perhaps too quiet at first—and yet full of interest as it advances. It has no clap-trap, no startling effects, no pitfalls for the feelings; but here and there, notwithstanding, the eyes moisten without our being aware of it. We shall not be so rapacious as to appropriate the story of so small a book; but the following will serve as a specimen of the style and manner. It gives a lady author's notion—and, in our opinion, a very just one—touching the accordance of ages in love.

"I had hoped never to marry!" said Reginald mournfully. "Hoped never to marry! What an odd speech! Never is such a solemn word! Surely you don't wish to be a melancholy, miserable old bachelor?"

"I am not sure that I wish to live to be old," replied Reginald with bitterness.

"Hush!—for shame! Life, depend upon it, has sweets at every period," said Carlton; "and for my own part, I have a great notion that old age is a very pleasant time—like the evening of the four-and-twenty hours, a sort of dressing-gown and slipper period. But then of course I mean a proper, respectable, comfortable old age, in which a wife—perhaps twenty years one's junior—plays rather a distinguished part."

"Then you don't approve of early marriages?" exclaimed Reginald, pursuing the theme, which seemed to have touched, perhaps jarred, upon some heart-chord.

"It is a pity for a man to marry while his liberty is pleasant—that is what I mean."

"And does it never occur to you as an audacious thing," replied Reginald with emphasis, "for a man, wearied as you would say with his liberty, but in reality surfeited with the pleasures which wear out, though they do not satisfy, the heart—is it not an audacious thing for such a one to dare to seek the affections, and ask the hand, of a young, inexperienced creature, with the bloom of her heart unruined—to whom he cannot offer sympathy in return for her love, any more than a withered branch can send back vigorous sap to its blooming neighbour: and since he cannot reflect back the glorious hopes of youth, if there is to be heart-union at all, he must drag her mind through the mire of his own experiences, until he teach *her* to sympathise with *him*, pluck from her at once the very flower of youth, instead of suffering it to fall away, leaf by leaf, little missed or regarded: rob her—"

"You're in love!" interrupted Arthur Carlton, pushing back his chair, and half starting from it. "Reginald Hamilton, you are in love!—and, puppy as perhaps you think me, I can respect, wonder at, almost admire deep feelings, though such I may never experience."

With this specimen we commend the book to the favourable consideration of 'the gentle and the good.'

RIPE BREAD.

Bread made of wheat flour, when taken out of the oven, is unprepared for the stomach. It should go through a change, or ripen, before it is eaten. Young persons, or persons in the enjoyment of vigorous health, may eat bread immediately after being baked without any sensible injury from it; but weakly and aged persons cannot; and none can eat such without doing harm to the digestive organs. Bread, after being baked, goes through a change similar to the change in newly-brewed beer, or newly-churned butter-milk, neither being healthy until after the change. During the change in bread, it sends off a large portion of carbon or unhealthy gas, and imbibes a large portion of oxygen or healthy gas. Bread has, according to the computation of physicians, one-fifth more nutriment in it when ripe than when just out of the oven. It not only has more nutriment, but imparts a much greater degree of cheerfulness. He that eats old ripe bread will have a much greater flow of animal spirits than he would were he to eat unripe bread. Bread, as before observed, discharges carbon and imbibes oxygen. One thing in connection with this thought should be particularly noticed by all housewives. It is, to let the bread ripen where it can inhale the oxygen in a pure state. Bread will always taste of the air that surrounds it while ripening; hence it should ripen when the air is pure. It should never ripen in a cellar, nor in a close cupboard, nor in a bedroom. The noxious vapours of a cellar or a cupboard never should enter into and form a part of the bread we eat. Bread should be light, well-baked, and properly ripened before it should be eaten. Bread that is several days old may be renewed so as to have all the freshness and lightness of new bread, by simply putting it into a common steamer over the fire, and steaming it half or three-quarters of an hour. The vessel under the steamer containing the water should not be more than half full, otherwise the water may boil up into the steamer, and wet the bread. After the bread is thus steamed, it should be taken out of the steamer, and wrapped loosely in a cloth, to dry and cool, and remain so a short time, when it will be ready to be cut and used. It will then be like cold new bread.—*American Farmer.*

LITERARY CULTURE NEEDFUL TO THE WORKING MAN.

Let the working man have what aids him in his vocation by all means, but let him also have what diverts his mind from his toils, and raises it above them. Let his understanding be cultivated, but also his taste, his sentiments, and his language. But is there not culture for the understanding too, in following with interest a critical delineation of an author's characteristics, a sharp definition of that in which two great pleaders are unlike; in judging on the specimens offered how far the lecturer is justified in his conclusions? It will by and by be more generally known that man's utterances may be as profitably studied as his machinery; nay, even that a Shakespeare or a Dante may be as wonderful a relic of ages as a mastodon or an ichthyosaurus. Again, not a few of the evils of our social condition arise from our great classes not understanding one another. Between the race that is educated by ease, by abundance, by books, and pictures, and operas, by mental labour, if by any, and the race that is educated by manual labour, by anxieties about having 'leave to work,' by practical familiarity with the utilitarian properties of things—a great gulf is fixed. Each is a barbarian unto the other. Their thoughts and feelings, their likings, their very words, are unlike. We must understand one another, we must confer on the common ground of common interest, we must learn to see through one medium, or we perish as a nation. One of the great mediators between us is literature. Let Shakespeare, Milton, Scott, Wordsworth, intercede between the hosts; give us truly one mind and one speech, and what remains will be settled at least with a mutual intelligence; and this worst alien act, the want of a universal participation in the grandest of all national literatures, will be done away.—*Rev. J. A. Scott at the annual meeting of the Woolwich Mechanics' Institution.*

PRICE 1½d.

THE AUTHORS OF CALAMITIES.

THE poverty of authors and men of learning has been a theme of all ages since literature and learning had an existence, and a general reason for such poverty is very obvious in the fact, that authors and men of learning seldom address themselves to any of the recognised means of money-making, but indulge in a toil or recreation—call it what you will—which gratifies taste and caprice in the first place, and only *may* be productive of more solid benefits in certain not very common circumstances. There are now-a-days, however, literary men who, by writing for the periodical press, and in other definite ways, realise considerable gains, though generally perhaps at the sacrifice of their more cherished predilections. A small number, by unusually successful author-craft, are in the tolerably regular receipt of incomes which might cope with some of the best in the professions, barring only a few of the highest. Still, there is a general sense of the wretched nature of a purely literary life: instances of the misery of literary men even of considerable fame occasionally come before us; and the literary class itself is dissatisfied with its social position, and irritated at the precariousness, as well as meagreness, of its means of subsistence.

Mr Howitt, in his 'Homes and Haunts of the Poets,' launches forth some complaints on this subject, and alleges that authors are at this day regarded by publishers exactly as they were in the days of Grub Street—poor, helpless, and intractable. He then quotes an anecdote which appeared a year or two ago in this Journal, to the effect that a London publisher expressed an inclination to give credit to a retail bookseller whom he supposed to be prospering, when, being informed that the man was an author—'Oh, that alters the question entirely. Open an account!—certainly not, certainly not!' To which a similar lively illustration is added:—

'The publisher of a celebrated review and myself were conversing on literary matters, when a very popular author was announced, who begged a word with the publisher, and they retired together. Presently the publisher came back.

'*Publisher.* We were talking of the relative merits of authors and publishers just now.

'*Myself.* Yea.

'*Pub.* Well, you authors regard yourselves as the salt of the earth. It is you who are the great men of the world: you move society, and propel civilisation; we publishers are but good pudding-eaters, and pay-masters to you.

'*M.* True enough; but you think that you are the sugar-manufacturers, and we authors the poor devil authors, who really have no right to more than artisan wages.

'*Pub.* Ay, if you will take them as wages, and often before they are earned. Grant that you are the salt of the earth; methinks the salt has wonderfully lost its savour when it has to come with a manuscript in one hand, and holds out the other for the instant pay, or the kettle cannot boil. See; there, now, is a man just gone that will be a name five hundred years hence; yet what does he come to me for? For a sovereign! I tell you candidly, that if no hero can be a hero to his *valet de chambre*, neither can an author be a hero to his publisher, when he comes in *forma pauperis* every day before him. For the life of me, I cannot maintain an admiration of a man when, like a rat, he is always nibbling at my purse-strings, and especially when I know—and what publisher does not know it?—that, give the coin before the work is done, and it never is done. I content myself with things as I find them, and I leave all homage to the reader.'

We can vouch for the truth of Mr Howitt's general statements on this subject, for we have heard many London publishers speak of the literary class as in great part deficient in honourable principle respecting money and the fulfilment of engagements. It is, in fact, extremely painful to hear the report of these tradesmen respecting the men of talent whom they have occasion to employ. They describe the more prosperous as crotchety and unreasonable; the poorer as unscrupulous in taking advances, and careless in discharging their obligations. Some who realise large sums by labours which appear by no means severe, not only squander these without any regard for the necessities of the future, but contrive, besides, to be deeply in debt to their booksellers and others; so that a sudden failure of health, or of the power of pleasing the public, would precipitate them at once into poverty; in which case it would, as usual, be taken for granted that they only experienced the evil fortune of a miserable profession, when the fact is, that they had been fortunate far beyond the same degree of desert in any other walk of life, but had misused the best gifts of Providence. Inspired by a feeling like that of the Arabs, who believe that it will be long before they can make up to themselves for the disinheritation of their ancestor Ishmael, some authors seem to consider the booksellers as 'fair game.' There can be no harm in pillaging men who, as a class, are the usurpers of literary rights and literary gains. To take, therefore, a sum from one bookseller towards the copy-money of a book, and, after all, hand over the manuscript to a second for an additional sum, or even to a *third*, after having taken sums in advance from *two*, is not unknown in practice. When men whom one would rather expect to be models of honourable feeling are depraved to this extent, there must be something strangely unsound in their situation, for to no other cause can it be attributed.

Mr Howitt's proposed remedy is, combination on the part of the authors—combination for funds to succour distressed members of their corps, 'for the support of every authorly interest, and the defence of every authorly right!' We are sorry that we most thoroughly believe combination for any purpose impracticable amongst literary men. Irritability of temper and mutual jealousy are the causes of this doom. But even though they could associate, we cannot see what association would do for them, supposing that they remain in other respects the same. It seems to us purely visionary to expect that the literary class will acquire the strength or dignity which Mr Howitt desires for it, otherwise than by an increase of integrity and prudence in the individuals of which the literary class is composed.

It may be possible, however, to show improved arrangements respecting literary labours and rewards, which would greatly ameliorate the worldly circumstances of authors, and prove favourable to that morality on which the elevation of the class must, we think, depend. It is not the first time that we have endeavoured to show that literary men, in being the employés of tradesmen, are in a wholly false position. The relation should be exactly the reverse; that is to say, men pursuing an active literary career should be the masters and employers, the tradesmen being subordinate to them, or, at the most, associated in a copartnery. Authors should, in short, use means to take rank as capitalists, and write for the realisation of publishing schemes in which they have a mercantile interest. Talk not of difficulties in acquiring capital, when these are overcome by men of every class and grade every day. So that there be saving, there will soon be capital. Let literary men condescend, if it be a condescension, to this law of political economy, and their rise to the rank of capitalists is certain. In many instances where there happened to be harmony of character and pursuit, literary *firms* might be established for the carrying out of the larger class of designs. So far, in peculiar circumstances, the present system might occasionally be departed from. Or one literary man of mature years might be the employer of a corps of younger ones. But the leading idea is—let the author be the ruler of his own labours, and the reaper of their proper rewards. By this plan there would be the further advantage, that literary schemes would be more heartily and justly worked out than at present. The bookseller, as is well known, is often baffled in his efforts to get a plan realised, by reason of the difficulty which one mind experiences in entering into the views of another. Where an author works upon his own plan, he of course works with a clearer perception of what he ought to do, and also with a stronger interest in his subject.

But 'the plan is visionary—it could never be reduced to practice!' This is not quite true. Several literary men are actually realising it to a very considerable extent, and are, we believe, feeling the benefits of it. We have ourselves acted upon this plan for many years, and not only found it easily practicable, but the only possible arrangement under which, to all appearance, the same labours could have been conducted. The gist of the matter is, that literary men ought to become men of the world in a greater degree than they are, if they would wish to keep abreast of men of the world. Of course, the plan now sketched is only applicable to men who seek a regular livelihood, and the means of rising in society, by the industrious use of their pen. Such are the writers of books primarily designed merely for

the gratification of the reading public; such are the writers and editors of periodical works, and those who devote themselves to compilations of all kinds; nineteenth, it is probable, of the whole literary class. These men are precisely in the situation of thousands of able and well-educated persons who have to give their days to the drudgeries of medicine or the technicalities of the law. They should contemplate themselves as strictly members of the great legion of the unendowed, who have nothing to depend upon but intellect judiciously and industriously exercised. It is, accordingly, no more than right and proper that these men should seek, by all honourable means, to improve their worldly circumstances, exactly as the members of other professions are doing. Nor can it be derogatory to any real dignity which belongs to their functions, that they should submit to all the prudent restrictions which beset other men in the like circumstances. If they were to see their real position in a true light, they would be under no danger of neglecting these maxims; they would resist the vanity which has before now caused an author with his first spare hundred pounds to set up a carriage; and they would put down the promptings of the worse imp which would persuade them that they are privileged by the use of a goose quill to every ridiculous foible, and not a few of the petty vices.

There is a smaller class of literary men who seek to produce works of a higher order, with but a small chance of being remunerated for their trouble. Such are the poets, the writers of laborious historical works, and the authors of speculative treatises. The productions of this class immensely exceed all others in value, yet they are not on that account sure to produce an adequate reward. Such is the unavoidable effect of the mercantile principle to which literature is left in the present stage of society, that the veriest toy of the brain, which it has only taken a clever man a fortnight to produce, may realise for its author a thousand pounds, or even more—such things are!—while an emanation of true genius, never to be allowed to die, or an elimination of truth which is to help on the regeneration of our race, will not pay the expenses of putting it through the press. One cannot but view with deep regret and sympathy the narrow circumstances to which authors of this kind are subject. But while society proceeds upon a commercial mercantile principle, it is not easy to see how such men, who have no patrimony to sustain them, are to be otherwise than poor, if they give themselves to labours which notoriously produce no solid rewards. Authorship of such a kind, in such circumstances, should be looked upon as a voluntary sacrifice of immediate and gross benefits, for the sake of something more spiritual and more highly esteemed. A counsellor who, instead of taking briefs, spent his nights and days in efforts to reform the laws, would be in a precisely analogous situation, and his poverty would be no marvel. Now, there is hardly one of the former and larger class of literary men who does not aspire to labours of a higher kind than those to which he devotes himself. He wishes, but the necessity of bread forbids. And thus his whole literary life consists of exertions which are not according to the *first intention* of his mind, but which he must reconcile himself to as unavoidable in his situation. Here, however, we have an evil no greater than what falls to the lot of nearly all professional men. We all have an inner life of the mind in which we would spend our whole time, if it were not that the outer life calls us in some other direction. Perhaps few enjoy the good fortune of the literary man,

in having daily labours so near akin to those on which they would spend themselves. These take him into the society of the intellectual—they allow him converse with books—they place him in circumstances from which he may in the easiest possible manner ascend to the exertions in which he would be engaged. And it occurs to us forcibly that the very hope of being able in time to produce some work of an important character, ought to be a powerful inducement to the slave of the press to be diligent in his calling and prudent in his living, that he may the sooner emancipate himself from the toil which only gives a pecuniary reward. How much nobler to husband resources for this purpose, than to launch into the vanities of the world, and sell the whole soul for a wretched competition with the Common Rich!

While much is said of the calamities of authors, we never hear of the calamities of booksellers—of which class it is always assumed that they are not merely well off, but wallowing in wealth. Yet publishers, in the mass, are by no means an extravagantly successful class of men. Some acquire wealth, which is the case in all professions; but many fail miserably in their undertakings, and some of the greatest have died without a sovereign. It is a sad consideration that Archibald Constable, who had a truly generous feeling for authors, paid only half-a-crown in the pound. View the history of the late edition of the 'Encyclopædia Britannica'—a really creditable undertaking, carried on and finished in a most conscientious manner towards the public, yet leaving its proprietors at the present moment £19,000 minus! Sometimes we hear of a bookseller making what is called a hit. He gives one hundred pounds for a manuscript, and gains six or seven times his own money. Then there is sure to be a dreadful outcry about the poor author, as if he were a robbed man; the public never reflecting, that for one fortunate venture, the bookseller makes three or four by which he loses, and that he did not buy the article below its ascertained value, but speculated upon a contingency. We also lay out of account the many losses which publishers undergo by their advances to authors. There is a kind of Arabian feeling in the latter gentlemen with respect to 'the trade,' as if it were only justice to leave them losers. For instance, Goldsmith owes £111 to his publisher, Mr John Newbery, who had taken a kindly charge of his affairs, even to paying his landlady her weekly rent. Goldsmith is in difficulties for a sum, and his friend Johnson takes the manuscript of his 'Vicar of Wakefield' to be sold, but not to John Newbery—for 'with him,' in Mr Howitt's words, 'it would have gone to reduce the standing claim'—no, but to Francis Newbery, a nephew, and probably rival of John, who gives sixty pounds. This transaction is an example of the manner in which booksellers are treated at this day, even by men to whom they have behaved with the highest degree of generosity. Can we doubt that such treatment tends to the injury of booksellers, and helps to make them regard authors in the manner in which they were regarded by the person adverted to at the beginning of this paper?

To conclude. We would again earnestly commend to the attention of literary men the views which have been here unfolded regarding improved arrangements for the publication of their writings. Let them be no longer children, content with the first gewgaw offered them, but steady, earnest, and honourable men of the world. It is, meanwhile, possible, under the present arrangements, for a man of literary talent to realise a subsistence by his pen, and even, by its means alone, to raise himself in the social scale. For this, however, steady industry and unfailing fidelity are necessary. It was obviously the greatest folly to suppose that booksellers are to encourage men of a different character, or that society is to receive them with cordiality. The first lesson, therefore, to be learned by an aspirant for literary honours is—to be a good citizen. Where

this rule is observed, a fair share of literary merit is the undoubted passport to most of those worldly advantages which the generality of men are in search of: where it is disregarded, intellectual merit, of whatever degree, must go very much for nothing.

THE PATRONESS.

A TALE.

ON one of those densely foggy evenings so well known to the inhabitants of our great metropolis, when all who have comfortable parlours or drawing-rooms will shut out the unpleasant scene the windows present by closely drawing the curtains, and ringing for candles earlier than the wonted hour—when the link-boys tender the welcome auxiliary of light to the foot-passenger who can afford a trifling recompense, and none will venture out of doors who have not some very pressing call—on such an evening in the winter of 1835, a young and delicate pedestrian might have been seen threading the maze formed by the narrow streets of Whitechapel, without companion or protector, and almost sinking under the weight of a cumbersome parcel, which bore the appearance of needlework, from one of the warehouses with which that neighbourhood abounds. Her hurried and terrified manner attracted no attention, each individual being intent upon reaching his own fire-side; and the darkness was so intense, that it shielded her from the observation of the rude passer-by, who otherwise would have frequently stared beneath her coarse straw-bonnet to gaze upon a face of uncommon beauty. She stopped ever and anon to relieve herself for a few moments from her heavy burden, by resting it on a doorstep; and paused at every turn, passing her ungloved hand over her fair brow, as if recalling to remembrance the spot on which she stood. Her apprehensions lest she had mistaken her way, redoubled when she found herself in a place of which she had no recollection; and in a state of great excitement and alarm she now ventured to enter a chandler's shop, that she might make inquiries for the street in which her home was situated. Such a question from one on whom poverty has set its unmistakeable seal, is not always answered with civility, especially when it calls the shopkeeper, on a cold evening, from the snug parlour and blazing fire. Ruth Annesley, however, met with a courteous reply from the kind-hearted widow to whom her agitated appeal was addressed. She cheerfully set about a minute and somewhat lengthy explanation; but to the terrified and almost bewildered girl the frequent repetition of 'third turning to the right, second to the left,' &c. was like the jargon of an unknown tongue.

'You are a stranger in London?' the widow observed, looking compassionately upon her. Ruth replied in the affirmative, adding that she lived with an aged relative, who was anxiously awaiting her return.

'Well, don't be frightened, my poor girl,' she kindly rejoined; 'I'll promise you that you shall be at your own door in less than a quarter of an hour, if you don't mind trusting yourself to the care of my son. He is as steady and as good a lad as ever mother was blessed with,' she pursued, perceiving that her auditor started a little at the proposition, 'so you need not be a bit afraid to put yourself under his protection; and he knows the way so well, that he could go blindfold, having trodden it every day, Sundays excepted, for the last seven years. Then he will carry your load for you, for you seem well-nigh tired,' she feelingly added, and she lifted a stool from the other side of the counter as she spoke.

'You are very good ma'am,' was all Ruth could reply, as she sunk exhausted into the offered seat. The benevolent widow now hurried into her little parlour, in which the young man alluded to was sitting, too much absorbed by the perusal of a book to hear what had been passing between his parent and her fair companion. But no sooner was the communication made, than he started upon his feet, and taking his hat from its

accustomed peg, hastened to perform the part of a knight-errant to the distressed maiden. His precipitation was, however, checked by his good mother, who suggested that, on such a damp evening, a greatcoat was necessary, tenderly adding, that as he had suffered severely from a cold last winter, it would be well for him to wear her woollen shawl for a cravat. Andrew Crawford submitted to these precautions with something like impatience, but actually blushed for his appearance on beholding the slightly-clad figure of the frail delicate girl whom he was about to escort, and without uttering a word, he tore the shawl from his throat and wrapped it around her shoulders. Struck by this unlooked-for kindness, as well as by his frank and open countenance, Ruth now unhesitatingly yielded her burden and herself to his protection and guidance. During the period occupied by the walk, the youth drew from his gentle companion an artless recital of the events of her brief life. She and a twin brother, since dead, had, she said, been left orphans in infancy. Her father's relations were persons of property, but as they had refused to render them any pecuniary assistance, they must have been brought up in a workhouse, had not her mother's only surviving kinswoman—her grandaunt—taken the charge upon herself. 'This dear relative,' she added, 'worked for us when we were unable to work for ourselves, imparted to us all the knowledge she possessed, and was to us in every respect like a fond mother.' She then proceeded to state that fresh misfortunes had since assailed them; that her brother's long illness had reduced them to a sad condition of poverty; and that her kind friend, now very aged and infirm, had lately been bereft of sight. This circumstance had induced them to come from Sheffield to London, with the hope that the best medical aid, there afforded gratuitously, would effect a cure; but this hope had not been realised. She had, she further said, whilst residing in the country, gained some knowledge of the art of dressmaking, but had not been able to turn it to any account in London, because work in that department of female labour was not generally to be obtained at home, and she would endure any hardships rather than leave her aged and afflicted relative: they were, consequently, now residing together in a humble lodging, living on the little she could earn by making shirts for a neighbouring outfitting warehouse.

'Have you, then, no other friend in this great city?' the young man interrogated, in a tone which betrayed the deep interest he had taken in her simple tale.

'I have no other friend on earth,' she made answer. 'Now my brother is gone, I have no one else to love or to love me.'

'Yours is a sad case,' he added commiseratingly; 'but if you will call again upon my mother, she may be able to recommend you to something better than your present employment, which I fear is but ill paid for.'

'It is indeed,' Ruth replied. 'I labour fifteen hours every day, frequently many more, and after all, can scarcely provide the common necessities of life. Yet,' she quickly rejoined, 'I am thankful to get even this, for London is a sad, unsocial, selfish place, and we should otherwise have died for want.'

'Though you have not been so fortunate as to meet with them, London has many charitable people in it, and is full of benevolent institutions,' the young man returned, a little jealous for the credit of his native city. 'Yet,' he musingly added, 'I know not of any institution for the encouragement of female industry. But you will call on my mother—will you not? I think she can be of service to you.'

'Oh yes, I shall call on her to thank her for her goodness to me this night,' the maiden energetically exclaimed, as with a joyful heart she now recognised the little court which contained her home. 'A thousand thanks, too, for your kindness, sir,' she hurriedly added, returning the shawl, and taking the parcel from his hands. 'Good-night;' and as she spoke the last words,

she bounded up a flight of stone steps into a large but miserable-looking house, which stood at the entrance of the court.

A week elapsed ere the young seamstress completed her task, and proceeded again in the direction of the abode of her new-found friends. Her surprise was only exceeded by her gratitude, on finding that the widow had already interested a benevolent physician in her behalf. This gentleman had engaged to represent her unfortunate situation to some ladies of his acquaintance, who he knew could serve her by finding her better employment.

We will now, with the reader's permission, shift the scene a little, and take a peep into the richly-ornamented drawing-room of Mrs Mapleton, a young lady of fashion, who had recently become a bride. The mistress of the mansion, arrayed in an elegant dishabille, was reclining on one of the sofas. Her companions were her cousins, two ladies who had filled the important office of bridesmaids; and a more striking contrast could scarcely be conceived than the trio presented. Miss Bellington, the elder of the group, was a beautiful young woman of five-and-twenty, who for the last four years had been sole mistress of an immense fortune. Her bright black eye, and clear brunette complexion, bespoke a character of impassioned energy. Widely removed from these two extremes was the gentle Celia Howard. She possessed neither the insipid beauty of the one, nor the animated charms of the other, but her mild countenance bore the expression of good sense and modesty, which, though exciting less admiration, won for her more really attached friends.

Into this elegant scene a gentleman was introduced. This was Dr Penrose, the benevolent-minded physician who had undertaken to find some remunerative employment for the poor seamstress. Nor was he unsuccessful. His representations greatly affected the ladies; and Miss Bellington at once offered to give her some articles of dress to make, which she had in hand. 'Come, doctor, you will escort me in your carriage to the house of the young needlewoman,' gaily added the fair patroness.

'Gallantry forbids that I should disregard such a request from a lady,' the doctor returned with a smile; and the fair heiress quitted the room to equip herself for the visit.

'Adelaide is a spoiled child, and must always have her own way,' the bride remarked; and while Miss Bellington was employed in searching for the articles she spoke of, Miss Howard took the opportunity of slipping a small donation into the hands of the doctor. 'Will you become my almoner, dear sir?' she quietly said; adding in a still lower key, 'permit me to caution you not to trust wholly to the discretion of my cousin, Miss Bellington, with regard to the future movements of your interesting protégée. She is kindly-intentioned, but is apt to imagine that more can be effected by her patronage than experience proves. It is painful to make these remarks,' she hurriedly observed; 'but I feel it a duty to do so, lest your kind efforts to serve this young woman should be a source of evil instead of benefit.'

The re-entrance of the young heiress prevented the physician's reply, but his countenance expressed all his lips would have uttered.

'Mrs Mapleton is a subscriber to several charitable institutions,' Miss Bellington observed, addressing her venerable companion as they entered the densely-populated neighbourhood in which the home of the young seamstress was situated; 'and,' she pursued, 'as she has a great objection to anything like trouble, and fancies she is too sensitive to come in contact with distress of any kind, she imagines that to be the most efficient way of doing good. For my own part,' she continued, 'I like to find out worthy objects for private charity, and really feel obliged, Dr Penrose, by your mentioning this poor young creature to me.'

'Each in its turn has a claim upon us, my dear Miss Bellington,' the doctor made answer.

The interest Dr Penrose had excited in the breast of the fair heiress for Ruth Annesley rather augmented than decreased when that young lady entered her lodging, notwithstanding that she had to climb up three flights of dark and dirty stairs ere her curiosity was gratified. There was to her a charm in novelty which counterbalanced all difficulties, and the very wretchedness of the abode gave it an air of romance which highly delighted her. The little room occupied by the aunt and niece was, however, far from partaking of the character of the other parts of the house; it was meanly furnished and ill-lighted, but there was a certain something which bespoke it the residence of minds of a superior order. The young needlewoman was amazed and almost terrified at the sight of the elegant tissue which was unrolled before her. She was diffident in exercising her skill on such costly materials; and though grateful for the offered aid, would fain have declined it, but her visitor would not hear of a refusal. She was sure, she said, from the excellent fit of her own dress, simple as it was, that she could accomplish it to her satisfaction; and she proceeded to make an appointment for the next morning for her to take her pattern.

'We must transplant that sweet flower to a more genial soil, my good sir,' Miss Bellington energetically exclaimed when they re-entered the carriage; 'she must not be allowed to wither away in this polluted atmosphere. I have already formed a plan for her future support. She must have a well-furnished floor in the western suburbs, and I'll venture to promise her plenty of employment from my friends alone.'

'Your plan is good, my dear Miss Bellington,' the doctor returned; 'but we must not be too sanguine of success. If—'

'Oh, I will have no buts or ifs,' the lady interposed, 'nor will I allow you to thwart my schemes of benevolence by your prudent precaution. I assure you that I can fully calculate upon success, and I'll take the entire responsibility upon myself.'

'If you will do that, my fair friend, I can make no further opposition,' her companion quietly rejoined.

The result of the above-related conversation was, that Ruth and her aunt were removed from the obscure garret they had for the last six months inhabited, to a comfortable lodging, in the neighbourhood of Hyde Park. Miss Bellington found no difficulty in persuading her young protégée to make the exchange; for, trustful and guileless as she was, she never for a moment doubted whether her patroness would fulfil all her engagements. To her it appeared an almost miraculous deliverance from the bitter want she and her beloved relative had so long endured, and her grateful heart beat high with thankfulness to a merciful Providence who had directed her steps in the darkness to the abode of the widow, who had been the primary human instrument in bringing about her present happiness. To her more sage and experienced protectress, however, the scheme did not appear quite so desirable. She was less sanguine than Ruth of the success of her new undertaking, and doubtful of the continuance of Miss Bellington's patronage. She had seen too much of life to place implicit reliance in fluency of profession; yet as her niece was full of hope and delight at the proposal, and was, in their present circumstances, wasting her youth by incessant and ill-requited toil, she could not long withhold her consent to the change. Miss Bellington was so enraptured with the manner in which Ruth had accomplished the task she had assigned her, that she was more than usually energetic whilst appealing to her fair friends in her behalf. Her affecting relation of the trials the young seamstress had so recently endured drew tears from many a bright eye, and our ladies had not been many days in her new abode, ere she was supplied with more work than she knew how to perform. She thus found herself in such an awkward dilemma, that she was obliged to apply to her patroness for counsel. 'Oh, you must do it all, my dear; you must not think of such a thing as disobliging any of

your employers,' was that lady's unhesitating reply; and vain were the poor girl's representations that her health was sinking under the effort, which was even greater than that she had made at her former occupation. 'You have yet to learn,' Miss Bellington proceeded, 'that there is nothing about which a lady is so impatient as the fabrication of a new dress. She will bear the loss of a lover with a better grace than a disappointment of that sort; so I tell you, my good girl, that you *must* get them all done by the time specified by the owners, or you will ruin yourself in the onset.'

'And can these ladies be really desirous of serving me in giving me this employment?' Ruth could not help saying to herself; but she dared not ask so rude a question of her noble patroness. With great exertion, accompanied by no small amount of bodily pain, the young needlewoman at length effected the task; but her trials were not over when this was accomplished. One of the ladies who had been so keenly touched by Miss Bellington's affecting recital of her sufferings, and who was, to use her own words, 'quite anxious to patronise the poor young thing,' did not scruple to make a bargain by which she was a considerable gainer, excusing her avarice by saying that she could not of course pay a person whom she employed under such circumstances the same as she did one of the fashionable milliners; another thought it an excellent opportunity of getting credit, which had been refused by her late *modiste*; a third, supposing the obligation she conferred on Ruth by employing her entitled her to dictate even in her domestic affairs, withdrew her patronage on the plea of her base ingratitude, because the poor girl did not think proper to follow her advice in everything; and a fourth—a dashing widow, whom Miss Bellington had represented as a very paragon of benevolence—having a favourite notion that the working-classes are incapable of husbanding their earnings, doled out her payments in such small sums, and took up so much time in calls at her mansion in order to receive these sums, that the money was literally twice earned ere it reached the hands of the person who was so unfortunate as to be employed by her. To these were added several ladies who were really desirous of serving her, but who engrossed so much of her attention and time—the young needlewoman's only property—by trivial remarks and minute directions, that little profit could be derived from the work: they put into her hands. This latter evil arose from inconsiderateness, not wilful injustice, but it was not the less felt on that account. Thus, though our heroine had no lack of occupation, she was not so amply remunerated as she had been led to expect, and she was still frequently distressed for the means for providing the necessities of life. The lodgings Miss Bellington had engaged for their use were expensive; and notwithstanding the promise that lady had made to Dr Penrose, and that she had more than once intimated to Ruth herself, that she would take the entire responsibility, she never afterwards alluded to the subject.

The interest which had been excited for Ruth did not flag through the winter months. Many a beautiful lip spoke with seeming sympathy of the fair young seamstress who had fabricated the dress or mantle in which the lovely wearer was arrayed, and they doubtless flattered themselves into the belief that they had been really actuated by benevolence when finding her employment. The London season followed—the *busy* season, as it is emphatically denominated by the 'west end' milliner and dressmaker—the season when the jaded apprentice and journeywoman can get neither necessary bodily exercise by day nor rest by night; and during these months there was still no complaint of want of occupation, whatever there might be of pecuniary embarrassment. But when this season was over, and the metropolis emptied itself of its fashionable inhabitants, that they might seek the sea-side breezes, or ruralise in sylvan vales, the poor young needlewoman's interesting story was regarded as a bygone tale, and

her very name was in most instances forgotten. Miss Bellingdon was not yet among the number who had left town. For some reason she was a lingerer in its almost deserted fashionable places of resort. This reason was certainly not that she might further the interests of her protégée, for a new favourite had taken poor Ruth's place in that fickle young lady's regard. This was a youthful painter, whom she declared to be a second Rubens, and whom she was now using her utmost endeavours to bring into notice.

The sudden desertion of her patronesses, many of whom were in her debt, was not the only trial our heroine had at this time to endure, for she was, in consequence, unable to pay the arrears of rent for their furnished apartments. It was true this did not exceed five pounds, yet it was a larger sum than she would have been able to raise, even by disposing of all her wardrobe. She naturally looked to Miss Bellingdon to assist her at such a juncture, at least by advice; but that lady was now inaccessible to her. She called again and again at her mansion, but always received an answer that she was particularly engaged, or from home. Her situation was rendered more pitiable by the rapidly declining health of Mrs Jones, who stood in greater need than ever of those comforts Ruth had once fondly anticipated being able to provide from the fruits of her exertions. Constant toil and anxiety had blanched her own cheek, and further enfeebled a frame always delicate; but of herself she thought not; all her solicitude was called into exercise for that beloved relative who had been to her as a mother. A circumstance hitherto unmentioned also served to augment our heroine's distress; this was the absence of her humble friends, the Crawfords. An unlooked-for event in their family had caused them, a few weeks previously, to leave London for a residence in a distant part of the country; and as their departure had been somewhat sudden, Ruth was consequently deprived in this exigency of their sympathy and counsel. Her upright mind, however, suggested the most honourable course to be pursued; which was, she thought, for them to leave their little property as a security for their debt, engage a low-rented apartment in the neighbourhood in which they had before resided, and for her to endeavour to procure work from her former employer. This plan met with Mrs Jones's approbation, though it was with a sickening heart that she contemplated the entire blight of her niece's prospects. Ruth's application for the employment which had before yielded her such a miserable pittance was successful, and she recommenced her labours, though with a less hopeful spirit. Had the Crawfords been still in the vicinity, she would have felt her situation to be less lonely; for, to let the reader into a secret unacknowledged even by the parties most concerned, a mutual affection, based on the purest esteem, had sprung up between the young artisan and the orphan girl. Though neither had allowed a word to escape the lips which could express his or her feelings on the subject, there was a firm conviction in the breast of each that the regard was reciprocal, and this thought would sometimes impart a ray of joy to the breast of the maiden in the midst of her deepest distress. So entwined, however, were her tenderest affections around the aged friend with whom she had for so many years shared her griefs and pleasures, that life seemed to offer a blank in the event of her death.

The summer passed, but the young shirt-maker saw nothing of the green fields, of the flowers, and little even of the sun; for her dark attic, with its sloping roof, and narrow window overlooking the back of some smoky dwellings, admitted but few of his beams. She beheld not the golden grain ripe for the sickle, nor the clustering fruits of the autumnal season; and the month with which we commenced our narrative again returned—returned with sad forebodings to the sorrow-stricken girl; for the gentle and meek spirit of her aged companion seemed now about to quit its frail tenement for a more congenial and blessed abode. In this exigency

Ruth would have sought the aid of the kind physician who had before taken such a lively interest in their welfare, but she was unacquainted with his place of residence; and all her attempts to see Miss Bellingdon, and to obtain the information from her, had been fruitless. So fearful was Ruth that it might be supposed that she was vaguely soliciting pecuniary aid from the widow Crawford, that she would not, when writing to her, inform her of the extent of her distress.

The dense fog which had shrouded the streets during the day, making it necessary for the tradesman and artisan to use artificial lights even at noon, had given place to a steady continuous rain, when the unhappy girl, thinly clad, and without anything to shield her from the inclemency of the weather, set out with the intention of once more seeking Miss Bellingdon's mansion. The fair heiress was actually her debtor for the last dresses she had made for her; and though it was an unseasonable hour for calling on a lady of fashion on such business, Ruth, urged by despair, had formed the resolution to see her if possible, and even to force herself into her presence should her request be denied. None heeded the young pedestrian as she pursued her hurried course through the crowded streets of business, and she was equally unregarded and uncared for when she entered the aristocratic locality of the west. Her earnest intreaties that the footman would take up her name, received an answer that Miss Bellingdon was dressing for an evening party, and could not be spoken to, but that she would pass through the hall in her way to the carriage, if she chose to wait.

'I will thankfully accept the offer,' Ruth replied; and as she spoke, she seated herself upon one of the chairs.

The man had scarcely left the hall, when the light step of the fair heiress was heard descending from her dressing-room. She was giving directions to her lady's-maid as she proceeded, and was too much occupied to notice that any one was below, till she came into contact with the pale, emaciated figure of the young shirt-maker, who sat there shivering in her wet garments. A start of recognition followed.

'Ruth Annesley!' she exclaimed in astonishment.

'Ah, madam, I am indeed that wretched girl,' was the reply; and the tone of anguish in which it was uttered struck like a knell upon the ear of her auditor.

'You look ill, child; what could bring you out on such a night?'

'Despair has driven me from my home to seek you, madam; for I know not but that, on my return, I may find my only earthly friend a corpse.'

Miss Bellingdon shuddered. 'Is your aunt so much worse then?' she interrogated. 'Why did you not let me know this before?'

'I have sought you many times, madam, and sent you my little account, but all my appeals have been disregarded,' Ruth made answer.

'The fault then rests with my servants,' Miss Bellingdon interposed, whilst the flush upon her already rouged cheek revealed that she was giving utterance to falsehood. 'Don't be cast down, however,' she soothingly added. 'I will attend to the matter to-morrow; meanwhile, take this trifle, and get your poor aunt something to do her good. Call in a surgeon likewise, and I will pay his bill whatever it may be.'

Ruth looked in the face of her late patroness. 'Madam,' she said, 'you engaged to pay for our lodgings at Kensington; but I was obliged to deprive my dear aunt of necessities in order to raise it myself, and finally to leave our little all as a security for the debt. I accept of this,' she added, taking the offered coin, 'for it is justly my due; but I ask for nothing more than justice at your hands. This dress,' she pursued, taking up the skirt of a beautiful silvered muslin tunic in which the fair heiress was arrayed—'this very dress cost me a night and a day of unrequited labour. Could you wear it in the gay ball-room, and not think of one of your own sex whom your inconsiderateness, not to say injustice, has brought to the borders of the grave?'

'Your afflictions have made you neither humble nor grateful, Miss Annesley,' Miss Bellington contemptuously remarked, writhing bitterly under a question which she felt to be unanswerable.

'They have not made me *servile*, madam,' Ruth rejoined; 'but you are mistaken in supposing that they have blunted my sense of gratitude, for my heart was never so keenly alive to kindness. But I am detaining you from your evening amusement, where voices will whisper far different language in your ear,' she added, stepping aside as she spoke, to let the footman pass and open the door for his mistress. Miss Bellington drew more closely around her the rich Indian shawl which her lady's-maid had just placed upon her shoulders, to shield her from the cold night air, and then hurried into the carriage, whilst her fragile and exhausted companion set out unprotected, to walk a distance of more than three miles to her miserable home.

Ruth had, in the foregoing scene, acted in opposition to the natural gentleness of her character. Her feelings had been powerfully wrought upon by injustice, and the sufferings of one dearer to her than her own existence; but when again alone, she shed a torrent of tears, which in some measure relieved her overcharged heart.

We leave the inhabitants of the narrow garret—one of whom appeared to be on the confines of eternity—to accompany the fair heiress to an elegant party assembled at the mansion of Mrs Mapleton. The usual circle of admirers and flatterers attended her steps, and hung upon her smiles, but she was this evening abstracted and spiritless. The once musical but now hollow voice of the young seamstress seemed ever and anon to sound in her ear, and the form of her dying relative was present to her mental vision. She was selfish and inconsiderate, but not heartless, and bitterly did she now repent having neglected the young creature she had professed to serve. Her painful reminiscences were augmented by the presence of Celia Howard, whom she had not met since the day that Ruth had been first introduced to her.

Miss Howard had that morning arrived at the house of her cousin, Mrs Mapleton, with the intention of again making it her home for a few days. She had not forgotten the circumstance; and when alone with Miss Bellington for a few minutes, she asked, with much concern, what had become of the young needlewoman whom Dr Penrose had taken her to visit on the day on which she had left town. The question caused a flush of crimson to suffuse the cheek of the gay beauty, and she was for a few moments incapable of replying. Rallying, however, she murmured something about having lost sight of her for some time, of having met with her that very evening, and of an intention to call upon her on the morrow. 'Will you allow me to accompany you, Adelaide?' Miss Howard asked; 'I purposed spending the morning with you.' Miss Bellington would gladly have dispensed with her society on such an occasion, but as she could think of no pretext for preventing her, she was compelled to acquiesce.

The morning came, and the two ladies set out in Miss Bellington's carriage for the apartment Ruth and her aunt occupied at Whitechapel. Twelve months previously, the fair heiress had entered this neighbourhood with self-gratulations, now she felt like a culprit about to appear at the bar of justice; and had not her aunt been her companion, it is doubtful whether she would have proceeded on her errand, though she was now really desirous of making some reparation for the misery she had caused. Her inquiries for the young seamstress were answered by the mistress of the lodging-house, who, supposing that they were come to visit the sick woman, and feeling much for the orphan girl and her aged relative, politely said she would show them up into their room. The two ladies followed their guide up the stairs, till she stopped at a low door, at which she gently knocked. Supposing that Ruth was from home on business, and knowing that Mrs

Jones was not able to leave her bed, the good woman quietly lifted the latch; but the visitors drew back on beholding the scene which the chamber presented. The invalid lay stretched on her low pallet, to all appearance in the last stage of dissolution. Her sightless eyes were closed, and her livid lips were firmly compressed with strong convulsions; but there was no signs of terror in her aspect—her gentle spirit seemed ready for its departure. By her side, in a kneeling attitude, was the emaciated and almost broken-hearted Ruth, in earnest but mute devotion.

The scene was too sacred to be intruded upon, and the woman gently closed the door, unperceived by the occupants of the chamber. The ladies returned in silence to the carriage; and no sooner had they entered it, than Miss Bellington burst into a flood of penitential tears. Keenly alive to sudden impulses of feeling, she had been impressed in no small degree by the sight she had just witnessed. Had she, she mentally inquired, been the means of hastening the aged woman's death?—of further blanching the wan cheek of that fair girl who was but in the first blush of womanhood? And she now unhesitatingly related the whole affair to her cousin, who, seeing that she was already so deeply moved, strove to soothe and comfort her.

Next day the visitors returned, accompanied by Dr Penrose; but interference was now too late. Mrs Jones had died the preceding night, and Ruth was confined to bed, her disease a combination of low fever and consumption, brought on by cold, want, and neglect. Everything which skill could imagine was attempted, but in vain; and useless also was the almost incessant watching of Andrew Crawford by the bedside of the sufferer, from the day he had heard of her illness. In seventeen days from the death of her aunt, the body of poor Ruth Annesley was carried from the same obscure dwelling, and laid in the same obscure grave—her fate nothing uncommon, except in so far as it exemplified the hollow delusions of not an ill-meaning, but only an inconsistent and giddy PATRONESS.

'GATHERINGS FROM SPAIN.'

MR MURRAY'S 'Home and Colonial Library,' one of the best of the popular serials, has been enriched by no work of greater interest than that which has just appeared, 'Gatherings from Spain.' Abounding in much new matter, gleaned not from books, but from actual journeys over the country, and written in a lively and suitable style, the volume possesses an original merit, and may appropriately occupy a place in all those libraries now forming for general instruction and entertainment. A few odds and ends of sketches from its pages may amuse our readers.

Spain, as the author begs us to understand, is not one, but a collection of countries, differing very considerably from each other in social and physical features; and to this cause he ascribes their ruin from the beginning—'a bundle of small bodies, tied together with a rope of sand, and which, being without union, is also without strength, has been beaten in detail.' This, however, can only be a secondary cause of national disaster. A people with radically good faculties would surely have long since dropped petty distinctions, and united for the general benefit, had circumstances permitted such a course. At present, Spain may be said to be in a process of fusing down to one general whole. It is losing its separate individualities and its old usages, and it remains to be seen whether there be a sufficient leaven of intelligence to carry it forward in a new and respectable career. Our own impression is, that it must go through a furnace of long tribulation before it realises the ardent expectations of its admirers.

One thing remarkable about Spain, is its hatred of France, contiguity in this instance producing only jealousy and contempt. The Pyrenees, which form the dividing boundary, are inhabited by a race of highlanders as impracticable as their granite fastnesses.

'Here dwell the smuggler, the rifle sportsman, and all who defy the law: here is bred the hardy peasant, who, accustomed to scale mountains and fight wolves, becomes a ready raw material for the *guerrilleros*; and none were ever more formidable to Rome or France than those marshalled in these glens by Sertorius and Mina. When the tocsin bell rings out, a hornet-swarm of armed men—the weed of the hills—starts up from every rock and brake. The hatred of the Frenchman, which forms "part of a Spaniard's nature," seems to increase in intensity in proportion to vicinity, for as they touch, so they fret and rub each other: here it is the antipathy of an antithesis; the incompatibility of the saturnine and slow with the mercurial and rapid; of the proud, enduring, and ascetic, against the vain, the fickle, and sensual; of the enemy of innovation and change, to the lover of variety and novelty; and how-ever tyrants and tricksters may assert in the gilded galleries of Versailles that *Il n'y a plus de Pyrénées*, this party-wall of Alps, this barrier of snow and hurricane, does and will exist for ever. Placed there by Providence, as was said by the Gothic prelate Saint Isidore, they ever have forbidden, and ever will forbid, the banns of an unnatural alliance.'

Spanish authors, it appears, either dare not or cannot tell what is the cause of national ruin. They ascribe it to the depopulation of the country by the drain of adventurers for America. But colonisation never produced a vacuum of this sort. Our author's theory goes nearer the mark. 'The real permanent and standing cause of Spain's thinly-peopled state, want of cultivation, and abomination of desolation, is *bad government*, civil and religious; this all who run may read in her lonely land and silent towns. But Spain, if the anecdote which her children love to tell be true, will never be able to remove the incubus of this fertile origin of every evil. When Ferdinand III. captured Seville, and died, being a saint, he escaped purgatory, and Santiago presented him to the Virgin, who forthwith desired him to ask any favours for beloved Spain. The monarch petitioned for oil, wine, and corn—conceded; for sunny skies, brave men, and pretty women—allowed; for cigars, relics, garlic, and bulls—by all means; for a good government—"Nay, nay," said the Virgin; "that never can be granted; for were it bestowed, not an angel would remain a day longer in heaven." A nation which can console itself with a joke, is perhaps more to be pitied than if it were aware of its own infamy. Bad government is only a result of a cause. Universal dishonesty is at the root of the evil. From the first minister of the crown to the lowest official, every one is a born cheat. 'Where robbing and jobbing are the universal order of the day, one rascal keeps another in countenance. A man who does not feather his nest when in office, is not thought honest, but a fool. The magic influence of a bribe pervades a land where everything is venal, even to the scales of justice. Here men who have objects to gain begin to work from the bottom, not from the top, as we do in England. In order to insure success, no step in the official ladder must be left unanointed. A wise and prudent suitor bribes from the porter to the premier, taking care not to forget the under-secretary, the over-secretary, the private secretary, all in their order, and to regulate the *douceur* according to each man's rank and influence. If you omit the porter, he will not deliver your card. If you forget the chief clerk, he will mislay your petition, or poison his master's ear. In matters of political importance, the sovereign, him or herself, must have a share; and thus it was that Calomarde continued so long to manage the beloved Ferdinand and his counsels. He was the minister who laid the greatest bribe at the royal feet. "Sire, by strict attention and honesty, I have just been enabled to economise £50,000 on the sums allotted to my department, which I have now the honour and felicity to place at your majesty's disposal." "Well done, my faithful and good minister; here is a cigar for you!" Peculation

in collecting the taxes is universal, and there seems no possibility of making the revenue meet the national expenses. Recourse has therefore been had to usurious loans and wholesale confiscations. 'Public securities have been "repudiated," interest unpaid, and principal sponged out. No country in the old world, or even new drab-coated world, stands lower in financial discredit. Let all be aware how they embark in Spanish speculations!'

With the example of universal speculation before them, and favoured by the weakness of the police, highwaymen in Spain do not stand on trifles, and carry on a large and thriving trade. Travelling with an armed diligence, or in armed bands, seems a general precaution; Spaniards, with all their boasting, not liking to encounter firearms. When not well provided with these appliances, our author recommends submission with a good grace. 'Those who have a score or so of dollars (four or five pounds), the loss of which will ruin no man, are very rarely ill-used; a frank, confident, and good-humoured surrender not only prevents any bad treatment, but secures even civility during the disagreeable operation. Pistols and sabres are, after all, a poor defence compared to civil words, as Mr Cribb used to say. The Spaniard, by nature high-bred, and a *caballero*, responds to any appeal to qualities of which he thinks his nation has reason to be proud; he respects coolness of manner, in which bold men, although robbers, sympathise.'

There are, however, other kinds of robbing in Spain. One consists in the exaction of certain dues at city gates, similar to the *octroi* in France; and as these dues 'are generally farmed out, they are exacted from the peasantry with great severity and incivility. There is perhaps no single grievance among the many, in the mistaken system of Spanish political and fiscal economy, which tends to create and keep alive, by its daily retail worry and often wholesale injustice, so great a feeling of discontent and ill-will towards authority as this does: it obstructs both commerce and travellers. The officers are, however, seldom either strict or uncivil to the higher classes, and if courteously addressed by the stranger, and told that he is an English gentleman, the official *Cerberi* open the gates and let him pass unmolested, and still more if quieted by the Virgilian sop of a bribe. The idea of a bribe, however, must be carefully concealed; it shocks their dignity, their sense of honour. If, however, the money be given to the head person, as something for his people to drink, the delicate attention is sacked by the chief, properly appreciated, and works its due effect.' The worst of all robbers, however, are the lazy, do-nothing keepers of country inns or *ventas*. 'These *ventas* have, from time immemorial, been the subject of jests and pleasantries to Spanish and foreign wits. Quevedo and Cervantes indulge in endless diatribes against the rogues of the masters, and the misery of the accommodations, while Gongora compares them to Noah's ark; and in truth they do contain a variety of animals, from the big to the *small*, and more than a pair of more than one kind of the latter. . . . Many of these *ventas* have been built on a large scale by the noblemen or convent brethren to whom the village or adjoining territory belonged, and some have, at a distance, quite the air of a gentleman's mansion. Their walls, towers, and often elegant elevations, glitter in the sun, gay and promising, while all within is dark, dirty, and dilapidated, and no better than a whitened sepulchre.'

On arriving at one of these *ventas*, the inexperienced traveller is a little surprised to find that the host 'remains unmoved and imperturbable, as if he never had had an appetite, or had lost it, or had dined. Not that his genus ever are seen eating, except when invited to a guest's stew: air, the economical ration of the chameleon, seems to be his habitual sustenance; and still more as to his wife and womankind, who never will sit and eat even with the stranger; nay, in humbler Spanish families, they seem to dine with the cat in some corner,

and on scraps. This is a remnant of the Roman and Moorish treatment of women as inferiors. Their lord and husband, the innkeeper, cannot conceive why foreigners on their arrival are always so impatient, and is equally surprised at their inordinate appetite. An English landlord's first question, "Will you not like to take some refreshment?" is the very last which he would think of putting. Sometimes, by giving him a cigar, by coaxing his wife, flattering his daughter, and caressing Maritornes, you may get a couple of his *pollo*s or fowls, which run about the ground-floor, picking up anything, and ready to be picked up themselves and dressed. Travellers are therefore in the habit of taking a part in hastening things forward in the great open kitchen—"One eye to the pan, the other to the real cat," whose very existence in a *venta*, and among the pots, is a miracle. By the way, the naturalist will observe that their ears and tails are almost always cropped close to the stumps. All and each of the travellers, when their respective stews are ready, form clusters and groups round the frying-pan, which is moved from the fire hot and smoking, and placed on a low table or block of wood before them; or the unctuous contents are emptied into a huge earthen reddish dish, which in form and colour is the precise *paropsis*, the food platter, described by Martial and by other ancient authors. Chairs are a luxury. The lower classes sit on the ground, as in the East, or on low stools, and fall to in a most Oriental manner, with an un-European ignorance of forks, for which they substitute a short wooden or horn spoon, or dip their bread into the dish, or fish up morsels with their long-pointed knives. They eat copiously, but with gravity—with appetite, but without greediness; for none of any nation, as a mass, are better bred or mannered than the lower classes of Spaniards.

Whether by robbing, taking bribes, or plundering guests at inns, when a man has made a purse, the difficulty consists in knowing where to put it. Consequently there is much hoarding and hiding in secret places. The idea of finding hidden treasures, which prevails in Spain, as in the East, is based on some grounds; for in every country which has been much exposed to foreign invasions, civil wars, and domestic misrule, where there were no safe modes of investment, in moments of danger property was converted into gold or jewels, and concealed with singular ingenuity. The mistrust which Spaniards entertain of each other often extends, when cash is in the case, even to the nearest relations—to wife and children. Many a treasure is thus lost from the accidental death of the hider, who, dying without a sign, carries his secret to the grave, adding thereby to the sincere grief of his widow and heir. One of the old vulgar superstitions in Spain is an idea that those who were born on a Good-Friday, the day of mourning, were gifted with a power of seeing into the earth, and of discovering hidden treasures. One place of concealment has always been under the bodies in graves: the hidings have trusted to the dead to defend what the quick could not. This accounts for the universal desecration of tombs and churchyards during Bonaparte's invasion.

From all we can understand, there seems to be but one class of habitually honest men in Spain, and that is the muleteers. With a number of loaded mules marching slowly in single file, these men act as carriers all over the country. The muleteer either walks by the side of his animal, or sits aloft on the cargo, with his feet dangling on the neck, a seat which is by no means so uncomfortable as it would appear. A rude gun, loaded with slugs, hangs always in readiness by his side, and often with it a guitar. . . . The Spanish muleteer is a fine fellow: he is intelligent, active, and enduring; he braves hunger and thirst, heat and cold, wind and dust; he works as hard as his cattle, never takes or is robbed; and while his betters in this land put off everything till to-morrow except bankruptcy, he is economical and honest, his frame is wiry and sinewy, his costume peculiar. Many are the leagues, and long,

which we have ridden in his caravan, and longer his robber yarns, to which we paid no attention; and it must be admitted that these cavalcades are truly national and picturesque. Mingled with droves of mules and mounted horsemen, the zig-zag lines come threading down the mountain defiles, now tracking through the aromatic brushwood, now concealed amid rocks and olive-trees, now emerging bright and glittering into the sunshine, giving life and movement to lonely nature, and breaking the usual stillness by the tinkle of the bell and the sad ditty of the muleteer—sounds which, though unmusical in themselves, are in keeping with the scene, and associated with wild Spanish rambles, just as the harsh whetting of the scythe is mixed up with the sweet spring and newly-mown hay meadow.

Another oddity is the Spanish barber—the Figaro. The profession of this personage is one of great importance in all the towns of the peninsula. There is no mistaking his shop; for, independently of the external manifestations of the fine arts practised within, his threshold is the lounge of all idlers, as well as of those who are anxious to relieve their chins of the thick stubble of a three days' growth. Here is the mint of scandal; and all who have lived intimately with Spaniards, know how invariably every one stabs his neighbour behind his back with words—the lower orders occasionally using knives sharper even than their tongues. Here, again, resort gamblers, who, seated on the ground with cards more begrimed than the earth, pursue their fierce game as eager as if existence was at stake; for there is generally some well-known cock of the walk, a bully, or *guapo*, who will come up and lay his hand on the cards, and say, "No one shall play with any cards but with mine." If the parties are cowed, they give him a halfpenny each. If, however, one of the challenged be a spirited fellow, he defies him, and a fight is the consequence. The interior of the barber's shop is curious. France may boast to lead Europe in hairdressing and clipping poodles, but Figaro snaps his fingers at her civilisation, and no cat's ears and tail can be closer shaved than his ones are. The walls of his operating room are neatly lathered with whitewash; on a peg hangs his brown cloak and conical hat; his shelves are decorated with clay-painted figures of picturesque rascals, arrayed in all their Andalusian toggery—bandits, bull-fighters, and smugglers. The walls are enlivened with rude prints of fandango dances, miracles, and bull-fights, in which the Spanish vulgar delight, as ours do in racing and ring notabilities. The barber's implements of art are duly arranged in order; his glass, soap, towels, and leather strap, and guitar, which indeed, with the razor, constitutes the genus barber. Few Spaniards ever shave themselves; it is too mechanical; so they prefer, like the Orientals, a "razor that is hired;" and as that must be paid for, scarcely any go to the expensive luxury of an every-day shave. Indeed Don Quixote advised Sancho, when nominated a governor, to shave at least every other day if he wished to look like a gentleman. The peculiar sallowness of a Spaniard's face is heightened by the contrast of a sable bristle. Figaro himself is all tags, tassels, colour, and embroidery, quips and quirps: he is never still; always in a bustle; he is lying and lathering, cutting chins and capers, here, there, and everywhere. If he has a moment free from taking off beards and making paper cigars, he whips down his guitar, and sings the last seguidilla: thus he drives away dull care, who hates the sound of merry music: and no wonder; the operator performs his professional duties much more skillfully than the rival surgeon, nor does he bungle at any little extraneous amateur commissions; and there are more real performances enacted by the barbers in Seville itself, than in a dozen European opera-houses.

We may close our notice of this amusing volume with the author's account of Spanish dances and music. 'In Spain, whenever and wherever the siren sounds are

heard, a party is forthwith got up of all ages and sexes, who are attracted by the tinkling like swarming bees. The guitar is part and parcel of the Spaniard and his ballads; he slings it across his shoulder with a ribbon, as was depicted on the tombs of Egypt four thousand years ago. The performers seldom are very scientific musicians; they content themselves with striking the chords, sweeping the whole hand over the strings, or flourishing and tapping the board with the thumb, at which they are very expert. The multitude suit the tune to the song, both of which are frequently extemporaneous. The language comes in aid to the fertile mother-wit of the natives; rhymes are dispensed with at pleasure, or mixed, according to caprice, with assonants, which consist of the mere recurrence of the same vowels, without reference to that of consonants; and even these, which poorly fill a foreign ear, are not always observed. There is very little music ever printed in Spain; the songs and airs are generally sold in manuscript. Sometimes, for the very illiterate, the notes are expressed in numeral figures, which correspond with the number of the strings. The best guitars in the world were made appropriately in Cadiz by the Pajez family, father and son. Of course an instrument in so much vogue was always an object of most careful thought in fair Bætica; thus, in the seventh century, the Sevillian guitar was shaped like the human breast, because, as archbishops said, the chords signified the pulsations of the heart, *à corde*. The instruments of the Andalusian Moors were strung after these significant heartstrings. Zaryab remodelled the guitar by adding a fifth string of bright red, to represent blood, the treble or first being yellow, to indicate bile; and to this hour, on the banks of the Guadalquivir, when dusky eve calls forth the cloaked serenader, the ruby drops of the heart female are surely liquefied by a judicious manipulation of catgut. The Englishman who laughs at all this, and considers the Spanish love of dancing and guttaring to be a species of madness, certainly a cause of poverty, is thought by Spaniards to be habitually mad, from his everlasting working, and also from what is a less equivocal symptom of insanity, *lending Spaniards money*, and is accordingly laughed at in turn.

PLEASANTRIES OF THE BENCH.

'It seems difficult,' says the *Law Review* in its opening paragraph, 'in casting our eye over the map of the sciences, not to place jurisprudence in the highest rank, if we do not indeed allow it the first place. None requires more enlarged understandings, more sagacious minds, in its cultivators; none draws its materials from more various sources; none assumes for its successful study an ampler body of knowledge, whether of books or of men; but, above all, its importance to the interests of mankind is beyond that of every other branch of learning: it is more eminently practical than any; its concern is with the whole order, the peace, and the happiness of society.*' The object of the work which commences thus, is to promote all discussions connected with this department of science and literature; to extend the knowledge of sound principles; and to further the real improvement of the laws, while checking the mere reckless desire of change. The *Law Review* is published under the auspices of the Society for Promoting the Amendment of the Law; a body which has Lord Brougham at its head as president, with the Lord Chancellor, the Dukes of Richmond and Cleveland, Lords Devon, Radnor, Ashburton, Campbell, and Mr Lushington as vice-presidents. It includes among its ordinary and honorary members many of the most distinguished men of the day; and not a few of these have enriched with their contributions the pages of the

society's literary organ. So much we have thought it necessary to say of the *Law Review*; although, on the present occasion, we have no intention to meddle with its more serious labours and duties. We have already given our humble aid in the *Journal* to the cause of law reform, and shall do so again; but just now we mean to go on the Welsh circuit for our own amusement.

The 'Recollections of a Deceased Welsh Judge' form the most amusing of the lighter papers in this legal periodical; and no wonder; for a regular Welsh judge, before law reform 'let in the judges of England upon the Celtic countrymen of Howel-dha and King Arthur,' had little else to do than to look out for amusement. The courts indeed 'were more dull than can easily be described, from the excessive stupidity of the people, both witnesses and jurors—the difficulty of getting anything like English out of them, or putting anything like sense into them—the trifling nature of their endless disputes—the inextricable entanglement of their endless pedigrees: yet the assizes lasted but a couple of days at each place, for the most part; and there was great pleasure in their clear air and fine scenery, especially after the House of Commons and Westminster Hall had fatigued one, and made London intolerable. Their streams were pure and refreshing, to say nothing of their fish; and their hills were wild and sunny, without taking into account the good mutton they fed.' His honour, accordingly, was very sorry when he found himself abolished, with no other compensation than his pension; and it is not surprising that he should have employed the additional leisure thus forced upon him in recalling the circumstances and characters of so agreeable an official existence.

Among the first of his compeers he brings upon the scene is 'George Wood,' nicknamed the Wood Demon, from a melodrama then in vogue—a lawyer greatly quizzed for his ugliness, and highly esteemed for his profound knowledge of special pleading, accurate understanding, sound judgment, and inflexible honesty. He was famous for the extreme conciseness of his style, which followed him to the bench; and his brother judge gives us a specimen, 'a story which, it may well be said, "he used to tell," for I believe he never told any other, and that one he was constantly called upon to tell at the circuit table, and always told it in the same words, and always with the same unbounded applause. It was as follows, for having so often heard it, we knew it by heart:—"A man having stolen a fish, one saw him carrying it away, half under his coat, and said, 'Friend, when next you steal, take a shorter fish, or wear a longer coat.'" In this narrative—which certainly represents the scene perfectly, and gives an epigrammatic speech—there are not quite thirty words, parties included.'

These roystering lawyers had a grand court which took cognisance of the misdeeds of its members. One of them, for instance, was guilty of delivering a letter of introduction to an attorney; whereupon he was brought to trial, and forthwith appointed penny postman to the circuit. Another actually dined with one of these proscribed parties, and received the congratulations of the court upon his very select acquaintance, for which he paid so many gallons of claret to the circuit purse. 'J. Allan Park had somewhat puffed Richardson to an attorney or two as a young man of excellent promise, and stated that he had so high an opinion of him, that he had made him his executor. The attorney-general failed not to note this in his next speech at the grand court, which seriously alarmed Richardson, and drew from him a solemn declaration that he should consider any such recommendations as hostile, and not friendly acts. This, however, did not save him from the title of Executor; till some one, observing the testator's ruddy face of health, and the executor's very pale and emaciated appearance, made the two change places, and gave Richardson the name of the Defunct.' All this, it will be seen, under the guise of merriment, preserved the purity of the bar. 'Even the jests were subservient

* The *Law Review* and Quarterly Journal of British and Foreign Jurisprudence. Nos. 1 to 9. London: Richards.

—ancillary, as we say—to the same end. They kept us ever in mind of the serious visitations ready at any moment to come down upon real offences; they were like the crack of the wagoner's whip, to be followed by the stroke if the ear had been assailed in vain. Then to the mummery of the circuit all were forced to bow. Whoever appeared in coloured clothes, had to pay for it by a fine, following a lecture by the attorney-general, in which the propriety of mode and dressing of the person was the subject of discourse: the rich wardrobes of various leaders were gorgeously described; how Mr Sergeant Cockell might, if he chose, dazzle the astonished sight with whole yards of cloth of gold across his portly paunch; how Mr Law himself could revel in the most flowery satins; how the very crier could appear so bedizened in lace, that he might burn for hundreds of pounds. The sumptuary laws were intended to diminish the expense of the circuit to poorer men. The rest of the rules were meant to prevent malpractices in the profession. The constantly flowing jest about small matters was calculated to beget a habit of not taking offence on grave occurrences, a very necessary thing in a profession the constant practice of which exposes every one to hear things said, and tempts most men to say things, somewhat painful to the feelings. Now and then a man would appear among us who was either too high or too sore to bear with the rude pleasantry of the body. Wo betide him if he showed such feelings! He might, without intending it, be very unexpectedly created a Duke, or even a Grand Duke, for his loftiness; or mayhap an *Archdeacon*, for keeping slyly out of the way; or a Doctor of the *Sorebone*, if he testified sensitiveness of jokes. I forget which fate overtook a learned sergeant (Davenport) when he was wroth with Mr Solicitor-General for filing against him an indictment for manslaughter, because a man had fallen out of the gallery during his address to the jury. It set forth that he feloniously did kill and slay J—S—, being in the peace of our lord the king, with a certain blunt instrument, of no value, called a long speech. But I think my able, learned, and lamented friend, Ralph Carr, was raised to the doctorate (of the *Sorebone*), when he took occasion to remark, that “he perceived the whole of the circuit set against him, from Mr Attorney-General Law down to Professor Christian,” a joke eminently pleasing to Law, who held his cousin Christian in extreme contempt.

This Law (Ellenburgh) is highly praised by the judge both for his abilities and jokes. ‘I remember one of his chosen subjects (butts, as they might be called) was Sylvester Douglas (afterwards Lord Glenbervie). There was no end of the laugh ever ready to come at Law’s call, and at Douglas’s expense. Sometimes he would dub him the Solicitor-General, in allusion to his constant asking for everything that fell. Then he would swear that Douglas kept a Scotchman, at half-a-crown a-week, always on the look-out, and to sit up all night, that he might be called if any one died in place. He had a notion that Douglas’s age was extremely great—nay, that he believed he was the Wandering Jew; and one morning, when in court, some doubt arose whether a statute was made in the fifth or sixth of Elizabeth—“Send,” said Ned Law, “for Douglas in the coffee-house, he is likely to remember its passing.” Nor did this even cease on Douglas leaving the bar. I well remember, when the kingdom of Etruria was announced by Bonaparte, and no one for some time was named, we were speculating who was to have it, Ned Law told us in the morning at Frank’s, “Don’t you know? Glenbervie has asked for it, and has great hopes.”

Lawyers, it would seem, are not always literary men. ‘Sergeant Lens, an excellent scholar, and a very considerable mathematician, is said to have entirely given over reading since he came into business. A brother judge of mine, a crack scholar as far as longs and shorts can make one, is believed to have no book in his house, and, I will venture to say, never reads anything but a newspaper, nor every day even that. His evenings would

be spent in sleep, were there no chessmen and no backgammon. Sergeant Cockell of our circuit, in the vacation, used to stand fishing for hours, and catch nothing; but the time between his breakfast and his dinner seemed to him a foretaste of eternity, at least in point of duration. I believe Mr Justice Buller never was known to exercise his mind except upon whist, when he was neither judging nor reading in “the books.” Dampier, a good scholar, used to read a good deal, but I suspect it was chiefly old divinity. Gibbs notoriously had never read anything since he left Cambridge with a very good classical reputation.’ All lawyers, however, ‘even Topping,’ we are told, read a little of Shakspeare, at least as much as enables them to quote, while going upon circuit, ‘Thus far into the bowels of the land.’ ‘Topping was the most uxorious of human kind, and daily wrote a long letter to Mrs Topping. The subject of the correspondence we all knew as well as she did herself—it was made up of his grievances. Did a jury give a verdict against him, he wrote and complained to Mrs Topping; did any of the bar offend him, she was instantly informed. He never kept this to himself, but always told us—often threatened us—occasionally rewarded us with some such confidential disclosure as this, made most significantly, and as by one well aware of its value, “I’ll assure you I felt so much how kind you were, that I wrote to Mrs Topping.” But generally it went thus—“The vile fellow behaved very, very ill: I wrote to Mrs Topping.” Nor was the judge spared. I have heard him say that “Mrs Topping felt my lord’s behaviour so much, she said she never could forget it.” But then he, being perhaps mollified by some more favourable charge of his lordship, would tell us that “he had written to intreat she would think no more of it, and that he hoped he had prevailed.” Once, however, I heard him say at Carlisle, “that the sergeant had behaved so ill, that Mrs Topping vowed she never would speak to him again as long as she lived,” and this he uttered as if he were stating that sentence of death had been pronounced upon the sergeant, whom he then regarded as a fallen and lost man.’ Topping’s irritability of temper gave him frequent occasion to write to Mrs Topping. ‘I once entered the court at Durham when both he and the sergeant were standing with their backs voluntarily turned on the judge. I saw some screw was loose. The first words that I could distinguish was Baron Wood saying, “I think, on the whole, you are right, Mr Topping;” to which he was pleased to answer, “I am sure I was very far from asking what you thought.” Another judge of more penetrable stuff would have been very angry at this bearish growl; but old George, who well knew his man, only said, “Well, well; who do you call?” (call); so the cause went on, while there was heard an undergrowl on the other side from the sergeant, abusing Topping for his insolence and ingratitude, and the baron for his ignorance and partiality, and calling for his clerk to bring him some of the stomach tincture, which we knew would console him, as it was generally brandy with some water added, to give it a name, rather than materially alter its nature.’ Brandy and water was not the only cordial in requisition by the lights of the law. When Garrow retired from court after gaining a cause, ‘in about half an hour old Humphreys, his clerk, returned with Mr Garrow’s compliments, and begging to have a small wooden-cased flask which he had left. We had all seen the sergeant handling that bottle, and, while Garrow was going on before the wind, quietly transfer it under his own bag, into which he quickly put it. So when the clerk came, the sergeant said, “What wouldst have, man? Your case is disposed of. Mr Garrow is gone off to town.” Away went Humphreys; but Garrow would bear no rival in his own art, and he required his flask on account of his “exhausted frame.” So back came Humphreys, and he would not go till the sergeant, most reluctantly, had to make his bag disgorge the case—what he valued more than any of the others among which it had forced its way. His comfort was, that the

Madeira he had just tasted was "but sad poor stuff—about a match for Garrow's trashy speech."

The Welsh judge looks upon it as a sort of suicide for an undistinguished lawyer to enter parliament. 'Of all inferiority, the most marked is the disastrous lot of the barrister, who, failing in the law, quits his gown, and carries his tongue to market in parliament. Respectful as the House of Commons ever is to high station, to success at the bar, it is contemptuous in the extreme to the body of lawyers there who have failed under the wig. I remember some years ago, before I quitted parliament, an ingenious ruddy-looking young gentleman (he seemed only five-and-twenty, but proved much older) addressing the house in a maiden speech, clothed in a country gentleman's attire, of top-boots and leather breeches. He was listened to with the attention and even kindness which might be expected to attend such a performance, until he unhappily let fall the expression, "as I have had occasion to know on our circuit," when suddenly there burst forth a yell of indignation at the fraud under which he had obtained audience—the kind of false colours he had been sailing under, and sailing, too, before the wind. Such a chorus, such a concert, *concordia discors*, such a storm of coughing, of laughing, of scraping, of calls of question, of roars of scorn and disgust, never greeted mine ears. It was, indeed, over in a minute; but the speech, too, was over, and nothing could have appeased it but the termination of that speech which it had brought about.'

In the old Welsh circuits, 'the whole appearance of the court was different from an English court: the habits of the people, and even their dress, were distinct; and when, as in most cases, the witnesses could not talk English, and had to be examined by an interpreter, you might well fancy yourself in a foreign country. Indeed, in addressing the jury, whether by the bar or from the bench, it was but too obvious that the majority frequently understood but little of what was said to them. In the north, the dialect of the witnesses was occasionally puzzling enough. We used to hear people talk of the *house* or the *house-parts*—meaning the kitchen; of a *middestead* for a dunghill; of a *steer* for a ladder; of *lating* for reckoning; and *laking* for playing; nay, of *darroch* for day's work; and a *treuthain* for a three weeks since. But in Wales there was much less in common between the natives of the country and the professors of the law brought into the country to administer justice. This sometimes led to some odd mistakes: take, as an example, the jury, who, after hearing a trial for sheep-stealing, in which the facts were, that the sheep had been killed on the hill, and there skinned, the robber taking away the carcase, and leaving the skin for fear of detection—all this was proved in evidence, but the jury supposed it to relate, not to a sheep, but to a human being, and brought in, after some hesitation, what they considered a safe verdict of *manslaughter*! But the lawyers on these circuits were as comical in their way as the witnesses and juries. One of them, Clarke, 'all unintentionally to create a laugh, and not very fond of any such testimony to his powers, would now and then make his audience merry without meaning it. As when the opposite counsel had been pathetic on his orphan client's hard lot—"Gentlemen," said Clarke, "why, I am myself an orphan"—he was seventy odd years old—"people's fathers and mothers cannot live for ever." No one can doubt of the pathos raised before being suddenly dissipated by this unexpected sally—not of humour, but of mere anger at any pathos having been imported into the cause. So, when a witness whom he was pressing with his angry, and oftentimes scolding, cross-examination, suddenly dropped down in a fit, and some said it was apoplectic—but privately Clarke heard it was epileptic—"My lord," said he, "it's only epilepsy—she must answer the question," as if the courts had taken a distinction between apoplexy and epilepsy.' The first time 'old Raine,' an ex-schoolmaster, sat in judgment, a man

was tried before the sessions for robbing a hen-roost, and acquitted for want of evidence against him. The chairman was ordering him to be discharged as a matter of course; but Raine said, though he fully agreed, yet he conceived it would be well to have him first whipt. The other justices repressed this ebullition of professional zeal, and explained the difference between justices and schoolmasters in respect of whipping.

NEW MEDICAL DISCOVERY.

THE public journals for the last few weeks have been teeming with accounts of a new method of producing insensibility to pain. The discovery is of American origin, and seems to bid fair to become among the most eminent of the benefits yet bestowed upon suffering humanity. The inventors are Dr Charles J. Jackson, a distinguished chemist, and Dr Morton, a dentist of Boston. The process has been made the subject of a patent, principally, it is said, to prevent its abuse—a precaution which the singular properties of the remedy appear to justify. A considerable number of the gravest operations in surgery have been performed upon patients subject to its influence, and in most cases the result has been a complete freedom from suffering. We beg to present a short account of this remarkable process.

It consists in the inhalation of, as it is supposed, the vapour of pure sulphuric ether. It is administered by means of a simple but peculiar apparatus. The patient is seated in the operating chair, and is requested to breathe through a mouth-piece, which is connected with some appropriate apparatus for the vaporisation of the ether, and is supplied with valve-work, which prevents the return of vitiated air to the apparatus. The respiration is continued for a few minutes, until the patient has lost all sensation, and very generally all consciousness as well, and lies back apparently in a gentle slumber. The sleep lasts, if the mouth-piece is removed, for two or three minutes, and the inhaler awakes considerably exhilarated by the operation. The apparatus used by the inventors consisted simply of a two-necked bottle, like that known as Woolf's, partly filled with sponges saturated with ether; that which has been used in London is an adaptation of the well-known soda-water apparatus, North's. It has been taken for granted in England that the liquid used is simply and only sulphuric ether; but the inventors themselves have not yet disclosed the true composition of the anodyne they employ. The experiments with us have been made with ether alone, and their success warrants the conclusion that this is the agent which has been used in Boston. Almost invariably, the first result of the inhalation is to cause a little spasm of the glottis, and cough, but this commonly vanishes after two or three inspirations, and the new atmosphere appears to be inhaled almost with avidity. Some persons become highly excited under its influence, and are possessed with an irresistible desire to be in motion; but if the inhalation is continued, this excitement gives place to a condition of complete ethereal inebriation, and the patient becomes perfectly still and motionless. At this stage there is a complete loss of volition, the hand may be lifted up, but it falls down powerless by the side of the inebriate; and if the eyelid is raised, it will no longer close against a threatened blow: this is the moment for the operation. In this unconscious condition the patient will then remain for about three minutes; but it is at the option of the operator to prolong the narcotism to fifteen, twenty, or even thirty minutes, without inconvenience to the generality of patients. Thus the most tedious and severe operations of the surgeon, which seldom exceed twenty minutes, and are generally of a much shorter duration, are capable of being performed during the state of insensibility. The most curious circumstance perhaps is, that the patient awakes from his lethargy almost at once; but for some hours after, he experiences an unusual buoyancy of spirits, which only evaporates with the ethereal odour itself. In a con-

siderable number of experiments the loss of sensation seems general, but the effects of the vapour are very various. Dr Bigelow, in the *Boston Medical and Surgical Journal*, gives an account of the phenomena presented in several cases which came before him. A young man took his seat in the chair, and after inhaling for a short time, rejected the apparatus, and taking from his pocket a pencil and card, wrote and summed up figures. He was then asked if he would submit to the extraction of his tooth, and he assented. The tooth was extracted, and shortly after the young man recovered his senses. He was quite unconscious of any pain. Other patients manifested the activity of certain intellectual faculties; and some, while still insensible, will raise themselves in the chair if desired to do so. It is very general, at the moment when the instruments are used, to notice that there is an expression of pain upon the countenance of the intoxicated person: there is a frown, or a scowl, or even sometimes a moan is heard; but these appearances are entirely illusive; the patients have experienced no suffering whatever. One woman exclaimed on recovering, 'That it was beautiful: she dreamed of being at home; it seemed as if she had been gone a month.' A boy, who is likely to become famous, was so enchanted with his sensations while two of his teeth were removed, as to insist upon the extraction of a third. With only one or two exceptions has any pain been experienced, most of the patients expressing themselves as totally unconscious of anything unpleasant. It would almost seem probable that the cases of partial failure—and they seem more proportionately frequent in England than in America—have their explanation in some imperfections in the process of inhalation. A patient operated on in London by Mr Liston was not aware that his leg was removed until he was told so. A young lady had five teeth extracted without being sensible of the operation in the slightest degree. Tumours have been dissected out; the difficult, tedious, and painful operation of lithotomy has been successfully completed; and a number both of the capital and minor operations of surgery have been performed, with complete absence of pain, and without any unfavourable after-results. Nay, what is more marvellous still, and what we believe the inventors could have scarcely anticipated, the process has been adopted in the practice of midwifery—the first to try its efficacy in this department being Professor Simpson of Edinburgh, who has found it to succeed to admiration in relieving the patient from pain and consequent exhaustion, and this without obstructing in the least the ordinary efforts of nature. Such has been the prosperous commencement of the career of this new remedy—to which no man will deny one of the first places in the list of blessings bestowed by medical science upon mankind. Simple, obvious, free from all show of mystery—except so far as the physiological action of the ether is concerned—the discovery has, in the course of a few months, established itself in the faith of the public as thoroughly as the discoveries of Jenner, Harvey, and the other masters of medical science. It is true that different operators may meet with different success, according to the perfection of the apparatus employed, and the susceptibility of the patient; but this is no more than what attends the introduction of every new process—experience and certainty can only be acquired by an enlarged experience.

As the writer of this notice has undergone the official inebriation, and during that condition had two teeth removed, he can add his own personal experience to the entire credibility of the facts stated here. The sensations produced by the ether are extremely various, if his own are a fair specimen of them, as it appears probable they are. A general thrill pervades the body to its very extremities at first, and there comes a series of, as it were, electric discharges in the limbs—no better simile is at hand. These feelings give way to a dreamy state, in which external objects partly enter and partly appear excluded: to this follows an

utter forgetfulness of everything. The soul seems to have cast off its earthly clog, and to be wandering it knows not where: in a word, there is a complete loss of individuality, a feeling as if one were another person altogether. At this time the operation was performed—the first tooth being extracted without a trace of pain, though it appeared to disturb the lethargic state, so that a dull pain of a trifling nature accompanied the removal of the second. Shortly afterwards the writer awoke, discovering, to his complete amazement, two grim-looking teeth on the table at his side. No ill effects followed.

THE COUNT CONFALONIERI.

EVERY one who has read Silvio Pellico's affecting narrative of his imprisonment in Spielberg, the great state-prison of Austria, will recollect that one of his companions in misfortune was the Count Frederick Confalonieri or Gonfalonieri, as it is sometimes written. Pellico, blind, and otherwise injured in bodily health by his long confinement, still lives in northern Italy, but the newspapers have lately announced the death of his old friend Confalonieri.

Of the character of this now deceased victim of Austrian oppression, very different accounts are given, but all will allow that the penalty he paid for his errors was sufficiently severe. Some time ago, in speaking of his imprisonments and their effects, he gave in a few words the following impressive history:—

'I am an old man now; yet by fifteen years my soul is younger than my body! Fifteen years I existed, for I did not live—it was not life—in the self-same dungeon ten feet square! During six of those years I had a companion; during nine I was alone! I never could rightly distinguish the face of him who shared my captivity in the eternal twilight of our cell. The first year we talked incessantly together; we related our past lives, our joys for ever gone, over and over again. The next, we communicated to each other our thoughts and ideas on all subjects. The third year, we had no ideas to communicate; we were beginning to lose the power of reflection! The fourth, at the interval of a month or so, we would open our lips to ask each other if it were indeed possible that the world still went on as gay and bustling as when we formed a portion of mankind. The fifth, we were silent. The sixth, he was taken away, I never knew where, to execution or to liberty; but I was glad when he was gone; even solitude was better than the dim vision of that pale vacant face! After that I was alone, only one event broke in upon my nine years' vacancy. One day, it must have been a year or two after my companion left me, the dungeon door was opened, and a voice—whence proceeding I knew not—uttered these words: "By order of his imperial majesty, I intimate to you that your wife died a year ago." Then the door was shut, and I heard no more; they had but flung this great agony in upon me, and left me alone with it again.'

It is painful to think that the man who could speak thus should have died not without a stain on his memory—unmerited, for anything we know, and at this distance it is difficult to get at the truth. The following appears in the Parisian correspondence of the *Atlas* newspaper:—

'The death of Gonfalonieri, that former idol of our republican salons, has not created one single public expression of regret, nor given birth to a single "Ode to Liberty," or "Lament for the Brave," in any of the republican journals. He was among the few survivors of Spielberg tyranny. His history is a romance, not so much for his own adventures, as for the extraordinary affection and devotion he had inspired in his wife, who was one of the most lovely and accomplished women of her day. From the very hour of his arrest, which took place at a ball at Milan, she left him not, save to intercede with his persecutors. She spent her youth, her fortune, in her ceaseless endeavours to soften the hearts

of his enemies, and finally laid down life itself, worn out with her efforts, to save him from captivity and death. She followed, attired in her ball-dress, all through the night of horror which changed his existence from a powerful leader of a popular party to that of a miserable and neglected captive. She cared not for the cold nor the rain, which fell in torrents; but at each relay she descended from the carriage which conveyed her, to hover round that which contained her husband, heedless of the brutal jeers and rebuffs of the *gend'armes*, who repulsed her with drawn sabres. At length, when, after some days' journey, they reached the gates of Spielberg, she fell upon her knees in supplication for one last word—one single word—before the dungeon closed upon him perhaps for ever. She was refused; and then she gave the cushion on which her head had rested during that long and weary journey into the hands of the least ferocious-looking of his guards, bidding him deliver it to the count, and tell him that *she* had been in the carriage which had followed his so closely; that it was *her* voice which he *must* have heard at each relay in wailing supplication and lament; and the pillow she now sent to him to rest his head upon was wet with tears shed for him alone. The guard took the pillow, and, with a cruel laugh at so much ingenuity wasted, cut it open before her face, fully expecting to find some important papers, some clue to a conspiracy, within. And Gonfalonieri knew not for years that she had even thought of him once after he had left her side; nor that she had hovered, disguised in a peasant's dress, for months together, round the bleak hill of Spielberg; nor that, by the sacrifice of her fortune, she had at length obtained the promise of his liberty, and then died! What *must* have been his feelings when he learnt all this! What must have been his love, his gratitude, to her memory! And how did he prove it? you will say. Why, he married again! and has died, the victim of his avarice, at the foot of the Alps, overtaken by the cold, which neither his age nor his feeble health were made to encounter in the cheap conveyance which he had chosen. He has died enormously rich, his property not having been confiscated, but allowed to accumulate during his long imprisonment. He had outlived popularity, and leaves no regret behind; he had suffered his fellow-martyrs to languish in want, nor extended a kindly hand to aid them, in spite of his wealth; so that the utter silence of the partisans of his cause is but just, and conveys a strong impressive moral.'

DWELLINGS OF THE WORKING-CLASSES.

On this subject we have on divers occasions spoken. Nothing would afford us greater pleasure than to hear of any rational plan, on fair commercial principles, being set on foot for providing houses of a neat and salubrious kind for the operative classes generally. Schemes have been projected for erecting whole villages out of London for workmen, the conveyance to and from town being at a cheap rate by railway. All such projects are visionary. We want to see no expulsion of working-men's families to what would soon be called Pariah villages. It is our belief that, without building houses at all, but only leasing old properties in town, and arranging them on an economical footing, pretty nearly all good ends would be served.

Among the best schemes yet brought into operation, in regard to erecting new houses, is that at Birkenhead, the rising town opposite Liverpool. Some time ago the 'Times' presented an account of the visit of Mr Chadwick and other gentlemen to the dwellings erected for the working-classes in this place, from which we gather the following particulars:—

'Without drawings or plans, it would be difficult to give an accurate conception of the improvements. The buildings are four-storeyed, of red brick, with light sandstone window-sills and copings. Their external aspect would suggest to a Londoner the idea of a block of buildings constructed for professional persons, for an inn or court of Chancery, and, with little addition and variation of ornament, they might match with the new hall of Lincoln's Inn. They

are, in fact, flats or sets of chambers, consisting of two sets on each floor. Each set consists of one living-room and two sleeping-rooms. The floors are of arched brick. The living-room is floored with a hard Welsh fire-brick tile; the sleeping-room floors are boarded. The staircases are of stone, with iron balustrades. The flat brick arches of which the floors are constructed are tied together with iron ties, and the whole building is fireproof.

'The most important points of improvement are, however, those in which some principles of the sanitary report, in respect to the means of cleansing and ventilation for the working-classes, are carried out. Each set of rooms is furnished with a constant supply of water, and also with sinks for washing, and a water-closet, and means of communication with a dust shaft from the whole set of chambers, by which all dust and ashes might be removed at once from the apartments without the necessity of the inmates leaving them. The party entered the rooms which were inhabited, and questioned the inmates as to their experience of them. One nursing mother, in a neat and well-kept set of rooms, attested to the superior conveniences of this arrangement, as a most important relief from the fatigue and exposure to the weather in a common town dwelling. She had now no occasion to leave her child alone whilst she went to a distance to fetch water; neither had she to keep dirty or waste water, or dirt or ashes in the room, until she could find time to carry them away. "She had now scarcely ever to go down stairs and leave her child." Each set of rooms was provided with one conduit for the ingress of fresh air, and another for the egress of vitiated air. Those examined were newly inhabited, but the immediate sanitary effect of the arrangements was perceptible to those who have visited such abodes in the entire absence of offensive effluvia or of "close smells." This observation was extended to the whole range of buildings. The sinks in each room were trapped with bell-traps, as were all the openings to the drains and the gully-shoots in the paved courts and thoroughfares. A constant supply of water was secured, the house-drains were well flushed with water, and cesspools were entirely abolished. This range of buildings is perhaps the first practical example of the entire removal of one chief source of physical depression and pestilence common to all the existing dwellings of the working-classes in towns.

'The price at which these objects were attained was the next topic of inquiry. The rents charged were from 3s. 6d. to 5s. each set, according to its position. But this included a constant supply of water, and the use of one gas-burner in each set of rooms, and all rates and taxes, and, moreover, two iron bedsteads, and a grate with an oven, and convenient fixtures. Some of the inmates admitted that they had paid as high a rent in Liverpool and other towns for no larger apartments of the common inferior construction, but without any of the conveniences and additions. The directors stated that they conceived there would be little value in an example which was not fairly remunerative to the capitalist, and that for this class of town dwellings, considering the trouble and attention they required, a less return than eight per cent. on the outlay would not suffice as an inducement to their construction; and this return they should make. Those who have lived in chambers in London, would admit that they had in the essentials very inferior accommodation for double and treble, and much higher rents. Each set of rooms was perfectly "self-contained," and the arched brick floors gave them advantages in respect to quiet which few sets of chambers possess.

'The impression produced by the inspection of these dwellings was evidently one of satisfaction. Mr Chadwick, whilst expressing his warm concurrence as to the advance made, stated his opinion that an additional room was required, and submitted that further improvements might yet be achieved, especially in the mode of warming and ventilation. The ventilation was at present with cold air, which all experiments showed the inmates would in winter try to stop, and succeed in doing so. The egress of vitiated air was to some degree dependent on the perception and care of the inmates. He considered that the ventilation must be self-acting, and that in such a range of buildings it might be accomplished with air that was warm as well as fresh, of which practical instances were in progress. Tubular chimneys of fire-brick, which had been in use in various places, with a much smaller bore, would "draw" better, and, with a careful disposition of fire-brick over the fire-grates, would give greater warmth with less fuel. He pointed to marks of damp on the stairs, opposite

to the ornamental sandstone copings, as a defect incident to the use of so absorbent a material. The thickness of the walls diminished the damp or the expenditure of fuel to prevent it, from the use of so absorbent a material as the common brick. But by the use of a harder or machine-made brick, and by the construction of hollow walls, warmth or dryness might be obtained with a less expenditure of fuel. In all respects, however, they were far superior to the common dwellings erected by building societies. Wider thoroughfares, which would give more sunlight to the lower and interior dwellings, would be well purchased, in some instances, by an addition of rent for an addition of space. The quality of the water supplied must be deteriorated by its retention in the expensive tanks at the top of the building. This, however, was attributable to the common and pernicious system of intermittent supplies of water by the water companies, which the public health required should be abolished. The size of the chimneys, Mr Lang the architect pointed out, was due, with other errors, to ill-advised building regulations. The materials of construction were the best the district afforded. The directors also stated that their own experience had suggested to them further improvements in the details of construction.'

Column for Young People.

MARY'S PETS.

It was a bitter evening towards the end of January, when Farmer Wilson drew his arm-chair close to the clean-swept, blazing hearth, and seated his little daughter Mary on his knee, while his wife busied herself in preparing their snowy supper of bacon and eggs.

Farmer and Mrs Wilson were an honest, industrious couple, residing on a well-stocked farm in one of the midland counties of England. They had but two children: their son Edward, a fine active lad of fifteen, was already most useful to his father in the management of their land, and withal possessed a considerable share of book-learning, so that he could write a letter, and cast up an account, as well as the village schoolmaster. Better than all, he had a warm, affectionate heart, was obedient to his parents, and fondly attached to his little, gentle, blue-eyed sister Mary, who, though now arrived at the mature age of ten years, was still the pet and plaything of the family.

On the evening I have mentioned, they were all chatting happily together, the feeling of warmth and snug comfort being rather increased than diminished by the wild howling of the wind out of doors, and the pelting of sleet against the windows. Suddenly a low crying was heard outside, repeated at intervals.

'Hush!' said Edward; 'what is that?'

'Is some poor animal perishing in the cold,' replied his father. 'Bring it in, my boy, and we will see.'

Edward lighted a lantern, and closing the door after him, went out. Having searched in vain for some time, he heard the sound repeated near his foot; and stooping, he picked up a miserable little kitten, covered with mud. He brought it into the house, saying, 'Look, father; this was the little animal you heard. I suppose it must have strayed from a distance, for it seems half-dead.'

'Ah, give it me, brother: poor little thing!' said Mary; and, regardless of the injury sustained by her nice white pinafore, in its contact with the soiled fur of the poor kitten, she carried it hastily towards the fire.

'Gently, Mary,' said her mother; 'let me wash it in warm water, and then you shall get it some milk.'

Mary ran for a saucer, while Mrs Wilson washed and dried the little animal. They then saw that it was a beautiful tortoiseshell kitten, about three months old. To Mary's great delight, it lapped the warm milk most eagerly, and soon seemed quite at home on the hearth.

'Ah, mother,' cried the little girl, 'may I keep it, and have it for my own cat? I'm sure it will be very good, and get very fond of me; for you know poor old Tibby, that died last month, used to purr when I called her, and arch her tail, and rub herself against my frock; and you know, since we lost her, we have been without a cat.'

'Thou mayst indeed, my lass,' replied her father, 'unless some one should come to claim the little thing—which, as it is so handsome a tortoise, may happen belike. But if not, we will keep it: it would be a sin to turn it out.'

Before Mary went to bed that night, she established her

cat, which she called Lily, in an open basket, lined with soft hay, at the side of the fireplace. The first thing she did in the morning was to visit the little stranger, and feed her with warm milk. Indeed at first little Mary felt inclined to spend the whole day in playing with her cat; but her mother reminded her that her book and her work should not be neglected. So Mary, like a good child, went after breakfast, and accomplished her lessons, and afterwards assisted her mother in various household duties, before she indulged herself in a game of play with Miss Lily.

Some weeks passed, and no one having come to claim the kitten, her little mistress began to regard her as entirely her own, and loved her better every day. Towards the end of February there was a heavy fall of snow, and for several days the ground was deeply covered. Edward found time to assist Mary in building a snow-house, which, as she said, 'looked like a real palace.' But its glories were short-lived; for the skilful architects soon destroyed their own work by a pitiless pelting of snow-balls.

One bitterly cold morning, as Mary was warming her frozen hands by the fire, preparatory to hemming a handkerchief for her brother, he came in, holding something carefully under his jacket.

'Look, Mary,' he said, 'what I found just now in the turnip-field.'

He took his hand from under his jacket, and displayed a thrush, apparently frozen to death. Its little claws were stiff, and its eyes closed; but its heart still throbbed, and by not bringing it near the fire, but gently chafing it with his hands, Edward soon succeeded in restoring it to life. He and Mary then fed it; and great was their joy to see the poor little thing hopping about the floor.

'It would be a pity,' he said, 'to keep it in a cage; but it can sleep in a corner of the hencoop, and I daresay it will soon get as tame and saucy as Miss Lily herself.' A sudden thought struck him. 'What shall we do, Mary,' he said, 'if your cat should take it into her head to eat the poor bird?'

'Ah, brother, I'm sure she wouldn't be so wicked; see how gentle she is, and she always has plenty to eat. Poor little Bobby! I'll call you Bobby—shall I, little bird?'

'For all that,' said Edward, 'if she were a little older, I would not trust to her kindness. You know 'tis the nature of cats to devour birds, and they do it whether hungry or not. However, she is so young, that I daresay we shall be able to teach her that she must keep the peace towards Master Bobby.'

By constant watching and admonition, they did indeed succeed in establishing a perfectly good understanding between the two favourites, so that no encounter of a hostile nature ever took place between them.

Two years passed on, and Mary's attachment to her pets was rather increased than diminished. Lily had grown a beautiful cat—deep orange shaded into fawn mingled with velvet-black and pure white on her glossy coat; her whiskers would put to shame those of any German count; and her sharp polished claws, ever ready to exterminate her natural enemies—the rats and mice—were always most carefully drawn in, and covered with their furry sheath, before she ventured to bestow a playful pat on Master Bob. His appearance was also greatly improved: surely never thrush had a more beautifully-speckled breast, or warbled a more melodious song, at least in the opinion of his young mistress. He was never confined in a cage, but spent his time in hopping about the house and yard, and playing with his friend Lily. It was quite curious to see them together; the timidity of the bird and the ferocity of the cat being completely overcome. They would cat off the same plate, and Bobby's favourite resting-place during the day was on Pussy's back, as she lay before the fire, stretched in luxurious comfort. At night, he constantly reposed in a corner of her warm basket, while she would purr, and seem quite pleased to have her little friend so near.

One fine morning in July, Mrs Wilson and the maid went out to milk the cows, leaving no one in the house but Mary, who was busily employed in finishing a shirt for her brother. Miss Lily had gone off on her own devices, so the little girl's sole companion was Master Bobby, who was as busy as his mistress, picking up some crumbs which she had scattered for him on the floor.

'You must give me a song, little birdie,' said Mary, 'as soon as you have finished your breakfast; and then you

shall perch on my shoulder, and we will go out to the hay-field to see what Edward is doing.'

While she was speaking, Lily ran into the house, not with her usual gliding motion and well-pleased 'fair round face,' but with raised back, thickened tail, and fiercely-gleaming eyes. She darted at poor Bobby, seized him in her mouth, and in a moment climbed to the top of a very high dresser that stood at one end of the kitchen. Mary gave a cry of horror, and was running instinctively to look for a long stick with which to dislodge her, when she was checked by the sudden entrance of another cat, a stranger, and a large ugly animal, which ran about the house smelling the ground, and mewing in a most disagreeable manner. Mary took the sweeping-brush, and soon succeeded in turning out the intruder, and shutting the door. Hardly did she dare to raise her eyes to look at her now hated cat, whose jaws she expected to see covered with the blood of her hapless bird. What was then her delighted astonishment to see Lily come cautiously down from her elevated position, and opening her mouth, lay Bobby on the floor. Mary ran to take him up, and perceived that, although frightened, and his feathers a little ruffled, he was perfectly uninjured. Then she knew the truth. The sagacious cat seeing the approach of her strange sister, and knowing well that she would have no mercy on Bob, had rushed in just in time to save him. She had caught him by the wings, and held them over his back in such a way as not to hurt him; and now she purred and waved her tail, and seemed quite ready to receive the joyous thanks and caresses of her mistress. What a wonderful tale had Mary to tell her friends that day when they came in; and we can almost agree in its rapturous conclusion. 'Indeed, father, I'm quite sure there never was such a cat in the whole world as Lily, nor such a bird as Bobby.'

I wish my young readers could have seen the saucer of rich sweet cream with which Miss Pussy was regaled that evening: I am certain they would have thought she deserved it well.

HISTORY OF PANTALOONS.

There is a tradition in Corsica, that when St Pantaleon was beheaded, the executioner's sword was converted into a wax taper, and the weapons of all his attendants into snuffers, and that the head rose from the block and sung. In honour of this miracle, the Corsicans, as late as the year 1775, used to have their swords consecrated, or charmed, by laying them on the altar while a mass was performed to St Pantaleon. But what have I, who am writing in January instead of July, and who am no Papist, and who have the happiness of living in a Protestant country, and was baptised, moreover, by a right old English name—what have I to do with St Pantaleon? Simply this: My new pantaloons are just come home, and that they derive their name from the aforesaid saint, is as certain as that it was high time I should have a new pair. St Pantaleon, though the tutelary saint of Oporto (which city boasteth of his relics), was in more especial fashion at Venice; and so many of the grave Venetians were in consequence named after him, that the other Italians called them generally Pantaloni in derision, as an Irishman is called Pat, and as Sawney is with us synonymous for a Scotchman, or Taffy for a son of Cadwallader and votary of St David and his leek. Now the Venetians wore long small-clothes; these, as being the national dress, were called Pantaloni also; and when the trunkhose of Elizabeth's days went out of fashion, we received them from France with the name of pantaloons. Pantaloons, then, as of Venetian and magnifico parentage, and under the patronage of an eminent saint, are doubtless an honourable garb. They are also of honourable extraction, being clearly of the Braccas family; for it is this part of our dress by which we are more particularly distinguished from the Oriental and inferior nations, and also from the abominable Romans, whom our ancestors—Heaven be praised!—subdued. Under the miserable reign of Honorius and Arcadius, these lords of the world thought proper to expel the Braccarii, or breeches-makers, from their capitals, and to prohibit the use of this garment, thinking it a thing unworthy that the Romans should wear the habit of barbarians; and truly it was not fit that so effeminate a race should wear the breeches. The pantaloons are of this good Gothic family. The fashion having been disused for more than a century, was reintroduced some five-and-twenty years ago.—*Posthumous volume of Southey's 'Doctor.'*

STANZAS.

THERE'S not a bird that charms the air,
There's not a flower that scents the gale,
There's not a bee that wantons where
The wild-rose gems the vale;
But each has some secluded shrine,
The leafy tree, or fragrant fold
Of blossoms, that in clusters shine
Its happy guest to hold.
There's not a heart whose pulses tell
How calm or wild the wish within,
But there is yet some secret cell
No stranger eye can win.
There records sweet of banished hours,
And tristful pangs of hope deferred,
As light and shade upon the flowers
Are felt, but never heard.
For many a sigh, and many a tear,
And many a grief are buried there,
While love's pale image lingers near,
The picture of despair.

—RUFUS DAWES.

THE FIRST STRIKING CLOCK.

In the time of Alfred the Great, the Persians imported into Europe a machine which presented the first rudiments of a striking clock. It was brought as a present to Charlemagne from Abdallah, king of Persia, by two monks of Jerusalem, in the year 800. Among other presents, says Eginhart, was a horologe of brass, wonderfully constructed by some mechanical artifice, in which the course of the twelve hours *ad clepsidram vertebatur*, with as many little brazen balls, which, at the close of each hour, dropped down on a sort of bells underneath, and sounded the end of the hour. There were also twelve figures of horsemen, who, when the twelve hours were completed, issued out at twelve windows, which till then stood open, and returning again, shut the windows after them. It is to be remembered that Eginhart was an eye-witness of what is here described; and that he was an abbot, a skilful architect, and very learned in the sciences.—*Watson's Dissertation on the Introduction of Learning in England.*

PRIDE AND HUMILITY.

I never yet found pride in a noble nature, nor humility in an unworthy mind. Of all trees, I observe that God hath chosen the vine—a low plant, that creeps upon the helpful wall; of all beasts, the soft and patient lamb; of all fowls, the mild and guileless dove. When God appeared to Moses, it was not in the lofty cedar, nor the sturdy oak, nor the spreading plane, but in a bush—a humble, slender, abject bush. As if He would, by these elections, check the conceited arrogance of man. Nothing procureth love like humility; nothing hate like pride.—*Feltham's Resolves.*

W. AND R. CHAMBERS

Have just added a small work to their Educational Course, entitled the PRIMER ATLAS. It consists of quarto maps of the Hemispheres, Europe, the British Islands, Asia, Palestine, Africa, North America, and South America, coloured in outline, and done up in a strong cloth cover. As the object of the publishers has been to give a humble class of scholars the means of acquiring a useful amount of geographical knowledge, this Atlas has been issued at the barely remunerative price of Half-a-crown. The Geographical Primer, formerly published, price 8d., will serve as a companion to this Atlas.

The second volume of the Select Writings of Robert Chambers, post 8vo., boards, with vignette title, is now published, price 4s.

As the stock of odd numbers of the INFORMATION FOR THE PEOPLE is now nearly exhausted, W. and R. Chambers beg to intimate, that they cannot insure a supply of any separate numbers of that work after the 1st of May; and would therefore recommend early application by those who wish to complete their sets. The work will always remain on sale, complete in 2 vols. 8vo., boards, price 16s.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 98 Miller Street, Glasgow; W. & S. ORR, 147 Strand, and Amen Corner, London; and J. M'GLASSAN, 31 D'Olier Street, Dublin.—Printed by W. and R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 166. NEW SERIES.

SATURDAY, MARCH 6, 1847.

PRICE 1½d.

THE MYSTERIOUS LEG.

THREE modern times, with their steam trips to Richmond, and railway rushings to Windsor—what are they to my younger days, when the Thames was haunted every holiday with six-oared gigs, which skimmed along the water in the midst of the songs and laughter of the rowers? This Age of Fun is only funny in print. In the steamboat, we are as grave and abstracted as if we were counting the revolutions of the wheels; and in the railway carriage, we could not hear ourselves speak, even if we were not too dull and grave to open our lips. Let me recall in imagination a single day of that olden time, when as yet there was not an equivocal hair in my whiskers—and, to say the truth, but few hairs of any colour; let me call up, for the benefit of this wise and solemn generation, a few of those roystering spirits which have long been laid—some of them in the grave, and some smothered and overwhelmed in gowns, coifs, ermined robes, and powdered wigs.

But I must be permitted to tell my story in my own way. Before lugging the reader into the gig, head and shoulders, among half-a-dozen law students—crazy young fellows, without a guinea among the whole set, and with fun and mischief in their heads instead of brains—I must conduct him to the place which is to be the scene of our operations. It is true I only learned afterwards what I am now about to relate; but you are very welcome to the anachronism—all I want to do, is to tell a story about a Leg as plainly and intelligibly as I can.

The leg I allude to at present was a leg of mutton; and how it came to occupy the important place now assigned to it was in this wise. The Boat-House at Putney was kept at the time by an old widower and an old maid, brother and sister, good-tempered old souls enough, but with one standing cause of disagreement—*siddut*, the Dinner. Not that their tastes were naturally different, either as regarded the viands or the cookery: it was all a question of time. What the brother liked one day the sister liked the next, and *vice versa*. But 'liked' is an improper word to use, for they never liked anything of this sort. They either loved to passion, or hated to excess. Such a thing Mr Brown held in perfect horror on that day of all the days in the week; and the very thoughts of the other thing proposed by him were enough to make Miss Brown sick.

'Had we not this very dish,' she demanded indignantly on the present occasion, 'last Tuesday was a week?'

'I will give in to its being roasted instead of boiled!' said Mr Brown with a sigh.

'Of course, of course—because you know I cannot stand roasting to-day in my state of health. But this is my thanks for slaving for you and your family

all my life, and being a mother to your motherless children, and putting every penny of my fortune into your till——'

'Hold, hold,' cried Mr Brown; 'draw it mild, or I will——'

'Yes, yes, you will; I know you will! What will you?'

'Emigrate! My mind is made up: I will stand this no longer. You have driven me out of house and home; you have banished me from my country: it is all over!' and Mr Brown put up his hands desperately, and settled his hat upon his head, as if he would have gone to New South Wales that moment.

'And all about a leg of pork!' said Miss Brown, cooling gradually down. 'Well, if I was a man! But it's no use talking: my life has been a sacrifice from the beginning; I have been a slave to you and your family all my days; I have been a mother to your motherless children; I have put every penny of my fortune into your till—and now it is to be a leg of mutton after all!'

'With caper-sauce, Molly!' added Mr Brown.

This stroke of policy had a prodigious effect. If Miss Molly Brown had a weakness in this world, it was a weakness for caper-sauce; and the very mention of the condiment inveigled to her lips the moisture which had begun to rise into her eyes. Still, it was only by degrees she allowed herself to be subdued. She had a passion for self-sacrifice, and offered herself up to the leg of mutton, willingly, it is true, but with a full sense of the immensity of the oblation. As the day wore on, however, her feelings insensibly changed. As the pot went on boiling steadily—thanks to her care—she imbibed a sort of maternal affection for its contents. She waxed proud of the leg of mutton, which she at length pronounced to be by far the most beautiful leg she had ever seen in her life. She, in fact, considered it a perfect curiosity, and denied emphatically that there could be such another in all creation. It was now well on to one o'clock. The snowy table-cloth was laid in the bar-room. Mr Brown fidgetted out and in, waiting for the moment to draw the beer; but the moment advanced as slowly as if it had a whole tun on its shoulders, and the landlord more than once looked sternly at the clock, suspecting it had some hand in it. As for Miss Brown, she was in the kitchen, watching the lid of the saucepan heaving gently, and opening its lips every now and then to let out a fragrant sigh and a musical murmur. The caper-sauce was all ready to be poured over the rich and smoking leg the very instant it was dished. It waited on the dresser in a willow-pattern boat—just as our boat arrived at the pier below the house.

Now, you can know little of the era I am treating of, if you are not aware of the importance we had all attached to the duty of providing stores for the voyage.

Even still, I admit, we can eat, but at that time we devoured. At present we are hungry once, or, it may be, twice a day; but at that time all young fellows, without exception, had a perpetual appetite, which was ready on every possible and impossible occasion. In a pull up the Thames more especially, it was in constant requisition; and I never heard of any one who was mad enough to trust to chance in such an expedition. For our part we had three different meetings before we could determine on what should be the principal feature of the basket; and it was not without considerable opposition from the minority that at length a leg of boiled pork carried the day. But this was a leg of pork! It hit curiously the precise medium between salt and fresh; being just pickled enough to tell you by a relish on the tongue that it was neither one nor other, and make you exclaim with the elegant and sensitive poet—

'Oh no, it is something more exquisite still!'

Well, we arrived, as I was saying, below the Boat-House—not to dine, however, but merely to refresh ourselves with a draught of beer on our way. Mooring our gig to the pier, we proceeded to the house, burthened of course with the all-important basket. We were not so green as to leave that behind us, even for the few minutes we meant to be absent. There were too many young lawyers, like ourselves, afloat that day, and we knew well the extent of the appetite of such gentry both for fun and pickled pork! We entered the Boat-House at the critical minute, just when Miss Brown was thinking to herself, as she peeped into the saucepan, that the time was come; and it was with some ill-humour, shared in by the impatient landlord himself, that she found herself called upon to carry in the tankard to the new customers.

Our basket was at the time in the custody of Tom Pope, sometimes called (for we had all *aliases*) Long Tom, and sometimes Peeping Tom, on account of his unreasonable length, and a strange habit he had of prying and tiptoeing wherever he went. It was surprising how quietly a fellow of his inches was able to set about his investigations; but he really seemed to move from corner to corner like a shadow, and as he was preceded by a nose of uncommon sharpness and lengthiness, he usually smelt out more mischief for us than all the rest of the party together. As Miss Brown came into the room with the tankard, Tom saw at once, by her portentous physiognomy, that she had left some interesting work behind, and we missed him from the room for a minute or two; during which I need hardly say, although quite ignorant of his whereabouts or whatabout, we kept the spinster under cross-examination as to the distances of divers places. When at length she turned to leave the room, Tom was standing listlessly, leaning his elbow upon the wall, and spelling a document over the door, indicating that the landlord was a grand archdeacon of some right-worshipful lodge, to the meetings of which that room was to be supposed consecrated and set apart for ever. As she vanished, Tom winked at us in a way which told plainly that we had better be off as quickly as might be consistent with perfect calmness and unconcern; and accordingly we emptied our tankard, lounged down to the boat, and were once more afloat, with our head up the river.

Glad was Miss Molly Brown to see our backs; and while the grand archdeacon drew the dinner beer, with an energy which sent the froth dancing over the sides of the pewter, she released her cherished curiosity from the saucepan, instantaneously deluged it with the caper-sauce, and bore it in triumph into the bar-room.

'Isn't it a beauty?' said Miss Molly, as she settled herself in her chair opposite her brother. The brother

looked critically at the leg, raised it a little with his fork, sniffed the caper-sauce, and then looked at his sister with an expression of doubt almost amounting to disagreement.

'Then it is not to be a beauty after all!' cried Miss Molly, taking fire: 'and why not, I wonder? Have I been a slave to you and your family—have I been a mother to your motherless children—have I put my fortune into your till—have I sacrificed myself to your leg of mutton—' But Mr Brown's look was at this moment so serious, so abstracted from anything like pettishness—nay, so dignified, I may say, that the virgin could get no farther. She bent towards the mystic dish, and the odour of the caper-sauce had the unwonted effect of diffusing an expression of dismay over her features. Mr Brown bent down upon the object of his scrutiny, cut a little, a very little—only just enough to raise the skin—and then, laying down his knife and fork, said to his sister with dreadful calmness,

'Miss Brown, this is a leg of pork!' The worshipful member was right. It was our leg of pork, which Tom had exchanged in the twinkling of an eye for their leg of mutton; but Mr Brown would have gone that moment before any justice of the peace in the kingdom, and made oath that there never had been any other leg in the saucepan—that his audacious sister had determined to gratify at once her taste and her stubbornness at the expense of everything great and sacred in human society. On her part, Miss Brown met the charge like a tigress. She had been sacrificed all her life, and would be a sacrifice no longer. The leg was none of hers, but his. She had bought it by his desire, not her own; she had put it into the saucepan with her own hands, as beautiful a leg of mutton as ever ran; she had watched it ever since as a cat watches a mouse; no human being had entered the kitchen that day but herself; she had skimmed it, and turned it again and again; not two minutes before it was dished she had raised the lid, and saw that it was the true leg of mutton it had been all along; she had poured the caper-sauce over it when it came out, just as if it had been an infant of a day old; and there it was!

'But I tell you it is a leg of pork!' said Mr Brown bitterly.

'Let it be what leg it will,' replied Miss Molly, 'I have told you all I know about it.'

'Who ever heard of caper-sauce with pork?' said the brother. 'I could have forgiven anything but that. That is downright horrible!' Here Miss Brown could hold no longer, but burst into tears, and wrung her hands at such a rate that Mr Brown was almost staggered in his idea of her criminality. After the mysterious dish was put away in the larder, and they had dined on bread and cheese, tranquillity was in some degree restored; but several times throughout the day, as the recollection recurred to Mr Brown, he looked sternly at his sister, and was heard to mutter between his teeth, 'Pickled pork and caper-sauce!'

While this scene was passing, we were getting up the river at a prodigious rate. Never was there a finer day, never did the sun flash so brightly upon the water, and never did the water break into such radiant smiles in reply. As for us, we were young, hearty fellows at any rate; but on this occasion, the elation of success, the consciousness of having done our work cleverly, gave additional vigour to our arms; and in the midst of songs and wild laughter—that still ring in this cold, dull ear—we pursued our way, making the skiff leap along the water like a race-horse over a plain. We dined early, and found that the mutton fully justified the eulogium of Miss Molly Brown. Being provided, however, with other *vivres*, we did not completely finish it; and being aware that we should all get as hungry as ever by and by, we put away into our basket the bone, which still boasted some tolerable pickings, and in due time took our way down the river again.

By the time we neared the Boat-House of Putney, we had become so voracious, that Long Tom suggested the propriety of casting lots for a victim; and this brought back feebly to our recollection our own leg of pork, which we had given away in the morning. Perhaps, thought we, these two curmudgeons may have left enough on the bone to stay our appetite—with the addition of the remains of their mutton—till we get home; and this idea was strengthened by a natural curiosity we felt to know what effect the exchange had produced on the economy of the Boat-House. In short, we landed, and were once more in the lodge of the worshipful brotherhood. Mr Brown was still sulky and suspicious. He walked about as if he had an air-pickled leg of pork continually marshalling him the way that he was going; but the wan and scared look of Miss Molly was still more gratifying to our pride. She was like a heroine entangled in an inextricable network of fate, and seemed to feel that in her own person she was a whole holocaust.

'We want something to eat,' said the spokesman of our party. 'What have you got in the house?'

'Nothing!' said Miss Brown, hastily interposing, for her brother was about to speak, and a taint tinge of colour rose into her waxen cheek with the feeling of woman's pity which prompted the denial.

'Have you nothing at all?' persisted our friend, addressing the masculine. 'No cold meat?'

'Nothing,' replied the host, 'but a leg of—hem!' (catching his breath).

'A leg of what?'

'Pork.'

'That is capital—I like pork. What say you, Tom?'

'By all means let us have it. Were it mutton, the case would be different; for cold mutton does not agree with me in the afternoon. What say you, gentlemen?'

'Perhaps,' interposed Miss Molly compassionately, 'the gentlemen would prefer cheese? It is a perfect miracle of cheese ours is!' But the notion was scouted indignantly, and 'A pork—a pork!' was the general cry.

The table accordingly was prepared; and you may guess our surprise when at length our own leg of pork made its appearance entire! This was beyond our hopes; and many a fond imagination we gave way to, as we saw the spot where the skin had been cautiously raised, and endeavoured to picture to ourselves the feelings of the dinner-party on discovering the nature of the metamorphosed mutton.

The mirth of our second dinner was as keen, but not as loud, as that of the first. We would not attract our host's attention in any way; for, in point of fact, we all knew that the thing could not end where it was, though each of us might have been uncertain as to the next move it would be proper to make. The affair, however, was settled in due time by Long Tom; who, at the conclusion of the repast, extricated his mutton-bone from the basket, and in a cool and business-like manner exchanged it for the pork-bone upon the table. We then gave the bell a pull—a short, stern, but dignified pull; and Miss Molly came into the room full of expectation, but with the undaunted air of an Indian widow consenting to the *sati*.

Now, our chairman was a fellow who made his fortune afterwards on the northern circuit merely by his eyes. Not that there was any expression in them, but the very reverse. They were large, full, dark, meaningless orbs, which looked at you without winking for minutes at a time, till you were lost and drowned in a profundity that seemed to have neither surface, nor sides, nor bottom. What fascination there could be in such eyes no one could ever imagine; but the mystery did not affect the fact; and although our friend was the mildest-spoken man on earth, I never knew a witness in his hands who did not complain that he was browbeaten!

'We do not want you, mem!' said he with chilling politeness. 'Be so good as to send the landlord.'

'It's all the same concern,' said Miss Molly, coming forward with her mind made up. 'What do you please to want?'

'What is to pay?'

'A shilling a-head, beer and everything included; and I hope you are satisfied that the cheese is a miracle.'

'There is the money: now send the landlord.'

'The landlord is at the bar, where he ought to be. He is not to wait upon the parlour, I hope? That is my department, and has been ever since I was born in this life of slavery and sacrifice; and I humbly expect—'

'Mem! we would rather see him, if you have no objection: we do not want to say anything harsh to you.'

'Oh never mind me. Not a bit! I will thank you to speak out for three weeks if you please; and pray be as harsh as ever you can, for I am used to be offered up!'

'What is all this?' said Mr Brown gruffly, as he entered the room. 'Nobody is to be offered up in my house: it is not in my license.' He had evidently been listening at the door. Our chairman fixed his eyes upon the culprit, and a dead silence prevailed for some time in the room.

'Sir,' said he at length, 'our covenant was for a leg of pork—and we have paid for it.'

'Well, sir?'

'It is not well, sir. Do you call this a respectable house? Do you call yourself a respectable licensed victualler? And do you presume to treat a respectable party in so improper a manner? We could see the landlord struggle hard, but in vain, to extricate his eyes from their captivity, that he might glance, if only for one moment, upon the dish. Miss Brown, however, who was in no such durance, was by this time bending a look upon the mutton bone, of such helpless dismay, that we wished ourselves well out of the house.'

'Sir,' concluded the chairman, rising in dignified disgust, 'your imposition was discreditable, and your effrontery has made it worse. We compassionate you—we despise you—and we wish you a particularly good afternoon!' and so saying, he clapped his hat on his head, and strode out of the room, all of us following in imitation, and taking leave of the criminal as we passed with a look of indignant scorn.

When we got to our boat, one of us was missing: it was Long Tom, and we waited impatiently for his arrival, that we might get out far enough into the river to indulge, without discovery, in the laughter that was smothering us. Poor Mr Brown had not turned his eyes upon the dish while we were in the room. He seemed to be under a spell, which compelled his endurance of our parting glances, as we glided away like so many spectre-kings; and all the while he could have had nothing more than an indistinct impression of something dreadful connected with the leg. We wished we could have seen him afterwards; we wished we could have heard the colloquy which must have ensued between him and his sister; but all we were ever after able to ascertain was, that his perplexity ended in downright fury, which discharged itself upon bone and dish alike.

When Long Tom at length rejoined us, we found that, loath to leave the scene of his triumphs, he had been peeping about the court for fresh mischief, when all on a sudden a window opened, and some missive whirled over his head, smashed against the opposite wall, and fell into the dust-bin. Curious to know the nature of the article, Tom tiptoed over the way, and to his great gratification found the bewitched leg, and the fragments of the dish that had held it. He immediately whipped up, unperceived, the mutton bone, exchanged it once more for the pork bone, and took his leave of the Boat-House, well satisfied with his day's work.

I need not say that we rowed merrily home that afternoon. It was so long before we could make another holiday on the river, that the impression made on the brother and sister by the above incident appeared to be in some measure worn out. Not, however, to be accused of shabbiness, we made up by our reckoning what the unfortunate victualler may be supposed to

have lost by our stratagem; and thus our consciences were relieved. The affair, however, was kept a profound secret from the brother and sister, who had been both materially improved in temper, and were never afterwards heard to quarrel about what they should have for dinner.

SKETCHES IN NATURAL HISTORY.

THE LARK.

'To the last point of vision, and beyond,
Mount, daring warbler! that love-prompted strain
(Twixt thee and thine a never-falling bond)
Thrills not the less the bosom of the plain.
Yet mightst thou seem, proud privilege! to sing
All independent of the leafy spring.
Leave to the nightingale her shady wood;
A privacy of glorious light is thine;
Whence thou dost pour upon the world a flood
Of harmony, with rapture more divine;
Type of the wise, who soar, but never roam;
True to the kindred points of heaven and home.'

WORDSWORTH.

THE well-known habits of the skylark, as here alluded to by the poet, have made it an object of much popular interest. There is hardly anything in nature more cheerfully beautiful than the song of this bird, as he soars high above his nest on a sunny morning. It has been appreciated in all ages, and the poets, from Theocritus downwards, have been eager to pour out their feelings on the subject. Old Chaucer expresses himself thus beautifully:—

'The merry lark, messenger of day,
Saleweth in her song the morrow gray,
And fiery Phœbus riseth up so bright,
That all the orient laugheth at the sight.'

With Shakespeare the lark is the 'herald of the morn,' which is a term strictly true to nature, as the bird rises in the air and commences his song before day. He has been heard so early as two o'clock of a spring morning. Milton, who likewise calls him the herald lark, brings him into a series of the most beautiful images anywhere to be met with in poetry, where, in *L'Allegro*, he describes himself in a situation

'To hear the lark begin his flight,
And singing, startle the dull night,
From his watch-tower in the skies,
Till the dappled dawn doth rise;
Then to come, in spite of sorrow,
And at my window bid good-morrow,
Through the sweet-brier or the vine,
Or the twisted eglantine.'

These words kindle up the flush and sparkle of summer dawn in our minds, in whatever circumstances we may hear them.

The larks are a family of many species, widely scattered over the globe. To Britain belong only two species—the skylark and the woodlark. The families nearest to them in character are the pipits, buntings, and tits, all of them, like the larks, field-birds. The skylark is a handsome bird, of about seven inches in length, of a gravelly colour, with a pointed conical beak, and long toes spreading out from one point, the hinder one being furnished with an unusually long claw. It is a creature of innocent habits, supported chiefly on grain and seeds, though it feeds its young exclusively with insects and larvae. The destination of the bird is to a life on the ground, where it builds in any little recess it can find, such as that between two clods, making its nest of dry grass and herbs. Grahame says justly in his *Birds of Scotland*—

'Thou, simple bird, dwellest in a home
The humblest; yet thy morning song ascends
Nearest to heaven.'

Generally, it has four eggs at a time, but it will breed twice or even thrice in one season. The length of the toe is an arrangement of nature, to enable it to walk over grass. It is decidedly the most peculiar feature of the external figure, and, as such, has excited the wonder of the rustic people, among whom a fancy prevails that, if

you wish to know what the lark says, you must lie down on your back in the field and listen, when the following discourse will reach you:—

'Up in the lift we go,
Te-hee, te-hee, te-hee, te-hee!
There's not a shoemaker on the earth
Can make a shoe to me!
Why so, why so, why so?
Because my heel is as long as my toe!'

The situation of the nest exposes the young to many accidents; but the attachment of the mother is ever ready to repair these as far as possible. A mower having cut off the top of a skylark's nest, leaving her sitting on her young, she speedily set herself to forming a kind of dome of dry grass over their heads, with a hole at the side for herself to go out and in at.* The mother lark, according to Jease, will even, when alarmed, remove her eggs or young to a new and safer situation. Buffon tells an interesting story of the instinctive philoprogenitiveness of a female skylark, which had as yet no offspring of her own. 'In the month of May,' he says, 'a young hen-bird was brought to me, which was not able to feed without assistance. She was hardly fledged, when I received a nest of three or four unfledged skylarks. She took a strong liking to the newcomers, which were scarcely younger than herself. She tended them night and day, cherished them beneath her wings, and fed them with her bill. Nothing could interrupt her tender offices. If the young ones were taken from her, she flew to them as soon as liberated, and would not attempt to effect her own escape, which she might have done a hundred times. Her affection grew upon her; she neglected food and drink; she now required the same support as her adopted offspring, and expired at last, consumed with maternal anxiety. None of the young ones survived, so essential were her cares, which were equally tender and judicious.'

The singing of birds, it is now well known, bears reference to the feelings of the breeding season. In the United States of America the lark is mute, and the force of a whole host of allusions in English poetry is lost, in consequence of the bird resorting to grounds farther north to breed.† With us, the male bird is ever ready, under the genial influence of the sun, or even at its approach, to spring up from the nest and pour forth his song, while the female, directly below, sits upon her young, perhaps enjoying the melody. Mr Mudie has described the mode of this serenade more minutely than any other writer. 'The lark rises,' he says, 'not like most birds, which climb the air upon one alope, by a succession of leaps, as if a heavy body were raised by a succession of efforts, or steps, with pauses between: it twines upward like a vapour, borne lightly on the atmosphere, and yielding to the motions of that as other vapours do. Its course is a spiral, gradually enlarging; and, seen on the side, it is as if it were keeping the boundary of a pillar of ascending smoke, always on the surface of that logarithmic column (or funnel rather), which is the only figure that, on a narrow base, and spreading as it ascends, satisfies the eye with its stability and self-balancing in the thin and invisible fluid. Nor can it seem otherwise, for it is true to nature. In the case of smoke or vapour, it diffuses itself in the exact proportion as the density or power of support in the air diminishes; and the lark widens the volutions of its spiral in the very same proportion: of course it does so only when perfectly free from disturbance or alarm, because either of these is a new element in the cause, and as such it must modify the effect. When equally undisturbed, the descent is by a reversal of the same spiral; and when that is the case, the song is continued during the whole time that the bird is in the air.'

'The accordance of the song with the mode of the ascent and descent is also worthy of notice. When the

* Edward Blyth, in the *Naturalist*, quoted by Mr Yarrell.
† Wilson's *American Ornithology*.

vibrations of the spiral are narrow, and the bird changing its attitude rapidly in proportion to the whole quantity of flight, the song is partially suppressed, and it swells as the spiral widens, and sinks as it contracts; so that though the notes may be the same, it is only when the lark sings poised at the same height that it sings in a uniform key. It gives a swelling song as it ascends, and a sinking one as it comes down; and even if it take but one wheel in the air, as that wheel always includes either an ascent or a descent, it varies the pitch of the song.

'The song of the lark, besides being a most accessible and delightful subject for common observation, is a very curious one for the physiologist. Every one in the least conversant with the structure of birds must be aware that, with them, the organs of intonation and modulation are *inward*, deriving little assistance from the tongue, and none, or next to none, from the mandibles of the bill. The windpipe is the musical organ, and it is often very curiously formed. Birds require that organ less for breathing than other animals having a windpipe and lungs, because of the air-cells and breathing-tubes with which all parts of their bodies (even the bones) are furnished. But those diffused breathing organs must act with least freedom when the bird is making the greatest efforts in motion—that is, when ascending or descending; and in proportion as these cease to act, the trachea is the more required for the purposes of breathing. The skylark thus converts the atmosphere into a musical instrument of many stops, and so produces an exceedingly wild and varied song—a song which is perhaps not equal either in power or compass, in the single stave, to that of many of the warblers, but one which is more varied in the whole succession. All birds that sing ascending or descending, have similar power, but the skylark has it in a degree superior to any other.'

At the sight of the hawk, the lark descends in an instant like a stone to the ground. On such occasions, and at any time when apprehensive of danger to its young, it alights a little way from the nest, and gets home in as stealthy a manner as possible. A change of weather has an effect on the disposition to sing. Warton beautifully says—

'Fraught with a transient frozen shower,
If a cloud should haply lower,
Sailing o'er the landscape dark,
Mute on a sudden is the lark;
But when gleams the sun again
O'er the pearl-be sprinkled plain,
And from behind his watery veil
Looks through the thin descending hail;
She mounts, and, lessening to the sight,
Salutes the blithe return of light,
And high her tuneful track pursues,
Mid the dim rainbow's scattered hues.'

The song of the lark is of a merry character, and individuals who are highly susceptible of external influences usually feel cheered by it. This is expressed in the following extract from the *Paradis d'Amour*:—

'The livelong night, as was my wonted lot,
In tears had passed, nor yet day's orb was hot,
When forth I walked my sorrows to beguile,
Where freshly smelling fields with dewdrops smile.

Already with his shrilling carol gay
The vaulting skylark hailed the sun from far;
And with so sweet a music seemed to play
My heart-strings round, as some propitious star
Had chased whate'er might fullest joyance mar:
Bathed in delicious dews that morning bright,
Thus strove my voice to speak my soul's delight:—

Hark—hark!
Thou merry lark!
Reckless thou how I may pine;
Would but love my vows befriend,
To my warm embraces send
That sweet fair one,
Brightest, dear one,
Then my joy might equal thine.

Hark—hark!
Thou merry lark!
Reckless thou how I may pine;
Let love, tyrant, work his will,
Plunging me in anguish still:
Whatso'er
May be my care,
True shall bide this heart of mine.

Hark—hark!
Thou merry lark!
Reckless thou what griefs are mine;
Come, relieve my heart's distress,
Though in truth the pain is less,
That she frown,
Than if unknown
She for whom I ceaseless pine.
Hark—hark!
Thou merry lark!
Reckless thou how I may pine.'

The lark is in esteem for the table, and when fat, as it is sure to be at certain seasons, it is very good eating. At Dunstable, where the animal is said to be in perfection, in consequence of the dry chalky soil on which it lives, they make lark-pies, which are sent all over England as delicacies. The immensity of the number of skylarks insures that 'larking' may be carried on to a great extent, with no danger to the preservation of the species. So great are the flocks in which the bird is found in Germany, that a tax of about a halfpenny a dozen, paid upon them at Leipsic, amounted, a number of years ago, to twelve thousand crowns, implying an annual take of seventeen millions of birds. From Michaelmas to Martinmas, the grounds in that quarter are said to be literally covered with them.*

The common mode of catching larks in England is by a large net, which the people draw over the fields. There is, however, a variety in this mode of 'larking,' which is practised in a few places, and which takes advantage of a curious disposition or weakness of the bird. A curved piece of wood, with bits of looking-glass stuck over it, is fixed across the top of a pole in the ground, with a string and a reel to cause it to revolve. A person sitting at a distance holds the string, which he pulls occasionally, so as to produce the revolution of the piece of wood. The birds are attracted in great numbers over the place: the common notion is, that they come to see themselves in the bits of mirror; but probably they are only fascinated by the dazzle of the sun's rays reflected therein. The men then bring a net over the spot, and catch great numbers of birds. In France, when other sporting is intermitted, the country gentlemen set up the twirling *miroir* in the charge of a boy, and amuse themselves by shooting the assembled larks. Sometimes half a dozen parties will be seen thus engaged on a field of no great extent; even ladies attend to behold the sport. There is something unaccountable in the behaviour of the birds on these occasions, for they flutter round the *miroir* without any regard to the deaths of their companions, as if insensible to danger. A French gentleman will thus bag six dozen larks before breakfast.†

The lark, like several other of the conirostral tribes, is occasionally found of an extraordinary colour, either black, or almost pure white. They are often reared from the nest in England, and sold as song-birds, in which character good specimens are so highly esteemed as to bring fifteen shillings a-piece. Not long since, a gentleman residing at Hackney, near London, kept twelve or fifteen pairs in an aviary connected with one of his windows, 'where they appeared in excellent health and plumage, repaying the care and attention bestowed upon them by pursuing the round of their various interesting habits—the song, the courtship, the nest-building, and feeding their young.'‡

The woodlark is smaller than the skylark: it builds under the shelter of bushes, and perches on trees, and is more insectivorous than its ally. It sings while

sitting, but more generally while sustaining itself on the wing above its mate, swelling its notes as it ascends, and sinking them as it descends, like the skylark. It is not a settled point whether the skylark or the woodlark has the finest song. That of the latter is universally admitted to be very beautiful, but not so powerful and prolonged as that of the former. 'When the bird takes the top of its flight,' says Mr Mudie, 'it sends down a volume of song which is inexpressibly sweet, though there is a feeling of desolation in it.' Burns, addressing it as a hapless lover, courts its 'soothing fond complaining,' and adds—

'Sure nought but love and sorrow joined
Such notes of woe could waken.'

'To hear the woodlark,' pursues Mr Mudie, 'on a wild and lone hillside, where there is nothing to give accompaniment save the bleating of a flock and the tinkle of a sheep-bell, so distant, as hardly to be audible, is certainly equal to the hearing even of those more mellow songs which are poured forth in richer situations.'

ANTOINE GALLAND.

ABRIDGED FROM THE FRENCH OF MADAME FOA.

On the 3d of July 1660, a young boy, about fourteen years of age, was passing with a light firm step along the broad and dusty road which led from Noyon to Bollot, a little village near Montdidier in Picardy. The costume of the youth was of a simplicity approaching to poverty, and a studious paleness had banished the freshness of early years from his brow, which wore an expression of the deepest uneasiness. At times his large black eyes sparkled with a flash of momentary joy, as he passed some little manor-houses, whose constantly lowered draw-bridges bore testimony to the good-natured hospitality of their inhabitants. Sometimes, also, the sight of one of the little white houses which arose out of the midst of a green meadow, drew to the lips of the traveller one of those languid smiles which rather resemble a nervous contraction than an expression of pleasure. But more frequently his downcast eyes and abstracted air denoted that he had some engrossing subject of thought.

The young traveller now struck off into a little rough by-way, bordered on each side by a row of apple-trees, behind which the sun was at this moment setting. Some paces before him trotted an ass loaded with grass and shrubs, and led by a young woman, who was forcing it to quicken its pace, by beating it now and then with a willow branch which she held in her hand. The names of Annette and Antoine escaped at the same time from the lips of both as she turned her head; and the lad forgot his troubles for a moment in greeting his sister.

These troubles were neither few nor light. Brought up from childhood at the college of Noyon, through the benevolence of the principal and a canon of the cathedral, he had now lost both his patrons by death, and after having made considerable advances in learning for his age, was sent back to his poor little village to be a burthen upon his widowed mother.

'Oh, Annette,' said he, as he concluded the recital of his griefs, 'imagine what I felt when, the very day after the death of the good canon, the new principal who had succeeded my first patron called me to his room and said, "As he who used always to pay your pension has just died, have you any one else interested about you who would continue the charitable work begun by the Canon Fernon?" "Alas! sir," said I, "I have only my mother, and she has barely sufficient for her own subsistence and that of her six other children." "I am sorry for it," replied he; "but the college cannot keep you for nothing: you must go back to your mother." You see, sister, after that, I could not remain another hour in the college. I set out without even bidding farewell to my companions. I had not courage. I set out, bringing nothing but some of my clothes on my back, a couple of crown-pieces—the last gift of the canon some days before his death—and the few books of which I had, by degrees,

become the happy possessor. But I have talked enough of myself. What is my mother doing? What has become of my brothers and my other sisters?'

'My poor mother is still a mantuamaker; but as she works only for the poor, it does not bring in much. James is a farmer's boy at M. Perrin's. The curé has taken John to his house as a choir boy, feeds, clothes, and teaches him reading, writing, and Latin. Mary works at Martin's the washerwoman's; and Frances and Genevieve are too young to do anything yet.' The speaker herself was the wife of the village apothecary.

Thus conversing while they walked by the side of the ass, the brother and sister arrived at a small white house at the entrance of the village of Bollot. An aged woman was seated on a stone in front of the door, busily occupied in sewing, who, on raising her eyes, uttered a cry of joy, and her work fell from her as she opened her arms to receive the new-comer.

'My son!'

'My mother!'

Some moments passed in tears and kisses.

'Mother,' said the youth sorrowfully, 'here am I again, come to be a burden on you!' And he related to his mother what is already known to the reader.

'God is good, my son,' replied the pious woman sadly but submissively. 'He will not abandon us. Besides, you are tall and strong. What can you do?'

'Alas! my poor mother, all I know, all I can do, is of little use in a village,' replied Antoine. 'I know a little Greek, a good deal of Latin, and have a tolerable knowledge of Hebrew.'

'And is that all you learned at college?' exclaimed the simple woman in a tone of regret.

Galland spoke of hope—perseverance—trust in God; but the old woman shook her head; and it was not till her son-in-law, the apothecary, came to offer to take Antoine for his shop-boy, that she was reconciled to his learning.

'You say nothing, Antoine,' replied Madame Galland, uneasy at the silence of her son.

'I say that Picard is very kind,' replied Antoine in embarrassment.

'Very kind!' repeated the old woman; 'why, he is generous, munificent! I never dreamt of half so much for you. Get up and thank your brother-in-law! Tell him that you accept—tell him that you will work hard—that you will be quiet, steady, and obedient.'

'Yes, mother,' replied Antoine in desperation.

When he entered the druggist's shop, and saw all the herbs piled on one side, the pots, jars of leeches, and vials on the other—when he saw the back-shop, dignified by the name of laboratory, a dark, dirty receptacle, reeking with all kinds of smells—when he saw the small loft over the laboratory, with a little straw laid down for a bed in one corner, and which showed him it was to be his room—when he saw the place where his life was to be passed—his heart sunk within him. But what were the feelings of the young and studious collegian when his brother-in-law, pointing out to him several caldrons smeared with ointments and cosmetics, said in a tone of gaiety, 'Come, my boy, off with your coat and clean these caldrons a little!'

Though Antoine felt his heart die within him, he said nothing, but threw off his coat, turned up his shirt sleeves, took the mixture which his brother-in-law gave him to clean the caldrons, and began to rub away as if he had never done anything else in his life.

'Bravo—bravo!' exclaimed the enchanted druggist, taking the desperation of the youth for zeal and activity. 'Bravo! Go easy, my boy. In a few days these little white hands will be as hard as mine, and these beautiful little nails will be as black as my own. Bravo—bravo! If you continue this way, you will become a capital druggist.'

'Is this to be the result of my ten years' study?' said the collegian to himself, with difficulty restraining his tears. He continued to work, however, and work hard too; but his heart was not in his occupation, and it did him no good. He grew pale and thin; he lost his spirits and his appetite; and his affectionate sister began to fear that her brother would die.

'Antoine,' said she one day, 'tell me what is weighing on your mind! My husband has often said we ought not to be above our situation. You are above yours, Antoine: is it not so? You were not born for mixing drugs, but to be a learned man: am I not right? Oh, you need not shake your head. I have received no education; I hardly know how to read; and I know no more of writing than suffices to sign my name; and, in comparison with you, who know so much, I am a fool. But I see clearly that here, at Bollogt, there is only one person with whom you enjoy yourself, and who brings brightness to your eye or a smile to your lip. It is the curé; because with him you can speak all your jargons of Greek and Latin that you learned at college, and many other languages besides. My poor brother! Let us put our heads together, and devise something to make you happy. Tell me what can I do for you!'

'Nothing, my dear sister—nothing. But listen to me, answer me frankly, but say nothing to any one else.'

'Well, what is it, Antoine!'

'Tell me, Annette, have I dreamt it, or did I not hear it said when quite a child, that we had an old relation in Paris? Whenever I ask my mother, instead of answering me, she bursts into tears. "You want to leave us," she exclaims; "you are not happy here." Happy here!' added the youth bitterly; 'how can I be so, after having passed ten years of my life in study! And delighting in it, how can I resign myself to scouring and cleaning children, to boiling herbs, and compounding drugs; for this is the extent of my employment with your husband! Annette! I have drunk of the stream of knowledge; and now, with parched lips, I am left to die. I want for air, for motion, for life. I will leave Bollogt; I will go to—'

'To Paris!' added Annette; for her brother, alarmed at having let his secret escape him, suddenly stopped.

'You are right, sister,' replied he sadly; 'and even you perhaps may blame me!'

'No—quite the contrary,' said his sister; 'for I, too, have some ambition for you. I should like to see you rich and happy, and I see clearly that it is not in my husband's shop you will find happiness. You will go to Paris—is it not so? Well, do not be uneasy as to the means of getting there. I have a few crowns which my husband knows nothing about; I kept them to buy books for you to-day at Montdidier. Here they are: but why do you not take them! Do not go standing on ceremony with me, your sister; besides, you can return them to me when you make your fortune,' added the kind Annette, putting into her brother's hand, who yielded to the last suggestion, a small leathern purse, but little swelled, alas! by the savings of the druggist's wife.

'It is not much,' replied she, as if ashamed of offering so little; 'but, however, it is enough to support you for ten days, and before that time you will reach Paris. Once arrived in the town, you can inquire for the Abbé Lecœur.'

'The Abbé Lecœur!' interrupted Antoine; 'he was a friend of the principal of the college at Noyon. I know him well: but he, will he remember the poor little collegian Antoine!'

'Our Aunt Margaret, our poor father's eldest sister, has been in his service these twenty years,' replied Annette.

'And what is her address at Paris!'

'No. 16, Cloisters, Notre-Dame.'

'And you say she is in service!'

'Yes; with the Abbé Lecœur.'

'What a sorry patronage!'

'Oh, the servant of an abbé is not such a bad relation to have,' said Annette; and with this assurance the thing was settled.

Two days after the conversation just related, Antoine, with his mother's blessing, and a little money (for an addition had been made to Annette's savings by the generosity of her husband), entered Paris on a Sunday, in the month of July in the year 1661. The first inquiry he made on setting his foot on the pavement of the capital of France was for the Cloisters of Notre-Dame. He was directed to them; and the two towers which rise above the city were given him as a clue through the labyrinth

of streets which he must traverse before reaching them. Aided by this kind of compass, he soon found himself in the court of Notre-Dame, just as the bell rang for prayers.

'My first visit ought to be to God,' said Antoine, whose heart beat audibly with doubt of his reception elsewhere. Then mingling with the crowd of worshippers who were thronging the gate, he entered the church at the same moment with an old woman, whose costume, that of his native Picardy, attracted his attention. But soon the sound of the organ, the harmony of the singing, the spacious edifice itself, the solemnity of the ceremonies, the multitude of assembled worshippers, the crowd of officiating clergy, the whole imposing scene, so new to him who, for a long time, had seen nothing but a miserable village chapel with its one solitary priest, so entirely absorbed him, that, plunged in devotional ecstasy, he forgot that he was not alone: his eyes fixed on the vaulted ceiling of the building, and his hands clasped, he breathed forth his desires, his prayers, his hopes.

When his devotions were over, he looked again at the old Picard woman, and she at him; and presently they fell into conversation, drawn together by some mysterious instinct, as some might say, but more probably by the consanguinity of their provincial dress. This old woman turned out to be his veritable aunt; and Antoine was hardly released from her embraces, before he found himself in her mistress's drawing-room, formally announced as the servant's nephew.

Madame Lecœur looked kindly at the young boy, who remained standing before her, modest and respectful, but unembarrassed. She asked him 'when he had arrived in Paris!'

'This morning, madame.'

'How did you come here from your own country!'

'On foot, madame.'

'On foot!' cried Madame Lecœur. 'Margaret, bring a chair for your nephew. You must be much fatigued!' added she kindly.

'Not very much, madame,' replied Antoine, sitting down.

'And for what are you come to Paris, my child?' again inquired Margaret's mistress.

'To try to continue my studies, madame,' said Antoine, casting down his eyes.

'You have been studying, then!' said Madame Lecœur in surprise.

'I was brought up at Noyon by the principal of the college, and by the almoner of the cathedral, M. Tempier.'

'My son knew the almoner very well,' said the lady.

'Yes, I have seen the Abbé Lecœur at my patron's,' said Antoine.

'That was my son. He knows you, then!' said Madame Lecœur.

'He has seen me, madame; but I think he can scarcely know me from among the crowd of boys that saluted him at his entrance and departure.'

'No matter, my child, I will speak to him about you,' replied the old lady. 'Tell me what you wish—tell me your plans. Your answers please me—your manners are good; but indeed I should feel interested in you, were it only that you are the nephew of my good old Margaret. I would gladly be useful to you, so speak freely to me. What was your plan, what were your intentions, in leaving home, and coming to Paris on foot, to find your aunt!'

'I hoped, madame,' said Antoine, 'that, with the recommendation of my aunt to your son, I might succeed in getting into some college; no matter upon what footing—even upon that of a servant.'

'And why a servant in a college, rather than elsewhere!' demanded Madame Lecœur.

'Because there are books in a college,' said Antoine hesitatingly, 'and masters, and lectures, and pupils.'

'Well, my child!' said Madame Lecœur, whose curiosity was raised.

Emboldened by the almost maternal kindness of her manner, Antoine replied—'For my services, I should receive some recompense either from the masters or pupils.'

From the former I should ask permission to listen; from the others—youth are kind to each other—I could borrow themes and books.

'But, my child,' replied Madame Lecœur, scarcely able to conceal the emotion which the answers of Antoine excited, 'you do not remember that your time would not be your own; your whole day would be occupied.'

'But I should have my nights, madame,' replied Antoine quickly.

'Charming—charming, child!' cried Margaret's mistress. 'Yes, you well deserve that we should interest ourselves for you. My son is well acquainted with M. Petitpied, doctor of the Sorbonne; and through the interest of this friend, I hope you will get a better place than that of a servant. Go, my child—go with your aunt. You have perhaps eaten nothing, and I have thoughtlessly kept you here. Go, give your nephew some refreshment, and prepare the little room opposite yours for him; and as soon as my son comes in, let me know; I myself wish to present Antoine to him.'

Accordingly, M. Petitpied, delighted and interested with the enthusiasm and perseverance of Antoine, was of great service to the little native of Picardy. Thanks to this learned professor, Antoine increased his knowledge of Hebrew and the other Eastern languages. He went through the usual course of the Royal College, and even began the catalogue of the Oriental manuscripts of the Sorbonne. In 1670, he had just entered the house of M. Godvin, principal of the Mazarin College, when M. de Mointel was setting out on his embassy to Constantinople. Having heard of young Galland, who was already beginning to be known for his industry and talent, he took him with him, and employed him in copying, from the Greek churches, formal attestations of the articles of their faith—a great subject of dispute between Arnaud and the minister Claude. Galland accompanied M. de Mointel in his voyage to Jerusalem, and took advantage of it to copy numerous inscriptions. From Syria he went direct to the Levant, with the intention of collecting some new medals. In 1679 he was intrusted with a commission to the Indies, for the purpose of making a collection that might enrich the cabinet of Colbert, the minister of Louis XIV.; and again he undertook a third voyage. Colbert being dead, Louvois, his successor, commanded him to continue his researches, and nominated him to the post of royal antiquarian.

About this time, being still in Smyrna, but on the point of returning to France, he was near being buried alive by an earthquake, which shook the whole town, and even threw down several of the houses, and among others that in which Galland resided. His life was saved by some beams providentially falling crosswise above his head, and thus leaving him room to breathe. He was extricated the next day, though with great difficulty.

On his return to France, living in an easy situation, with a fine library at his command, and a numerous collection of coins, and well versed as he was in Arabic and the Persian and Turkish languages, with which he had become familiar during his sojourn in the East, Antoine made use of his retirement to complete several works; among others, 'The Thousand and One Nights,' better known in England as the 'Arabian Nights' Entertainments.' He had his nephew, Julien Galland, with him, whom he brought up, and to whom he communicated his taste for the Oriental languages. In 1709 he was made professor of Arabic in the Royal College of France. Galland laboured unceasingly in whatever situation he found himself, paying little regard to his wants, and none at all to conveniences. His whole study in his lectures was to come direct to the point, without any regard to encumbering ornament. Simple in his habits and manners, as in his compositions, he would all his life have taught his children the rudiments of grammar with the same pleasure he took in exercising his erudition. He carried his integrity, as every truly honest man will do, even into the most trifling matters; and his accuracy was so great, that, when settling with his employers for his expenses in the Levant, he sometimes only charged them a penny or twopence, and sometimes nothing at all, for days in which, by some

accident, or even by involuntary abstinence, he had not spent more.

Though the author of many learned and important works, that which has made him popular is 'The Thousand and One Nights.' On the appearance of the two first volumes of this work, a singular hoax was played off on the author. One very cold night, in the middle of winter, Antoine Galland was suddenly awakened by several knocks at the street-door. He got up, threw his dressing-gown hastily around him, ran to the window, opened it, and, in spite of the darkness, perceived several persons assembled at his door. 'Who is there?' said he.

Several voices instantly answered, 'Is this Monsieur Galland's!'

'Yes,' replied he.

'Are you sure?' inquired they again.

'Quite sure,' said Galland.

'Take notice,' said one of the persons below, 'that what we have got to say can only be said to himself.'

'Then you may speak freely, for I am Antoine Galland; but speak quickly, for the wind is blowing in my face in no very agreeable manner.'

'Do you speak,' said one of the interlocutors to his neighbour.

'Speak yourself,' rejoined he.

'No, I must speak,' said a third.

'Ah, gentlemen, you must let me have a word,' exclaimed a fourth.

'For the love of Heaven, gentlemen,' cried Galland, who was perishing with cold, 'make haste: I am freezing!'

The same colloquy recommenced, and Galland, who had been listening with wondrous patience, again exclaimed, still shivering, 'For the love of Heaven, gentlemen, make haste, for the cold is piercing!'

At last all the young people who had disturbed the sleep of the Orientalist joined in one chorus, 'Ah, Monsieur Galland, if you are not asleep, tell us one of those stories which you tell so well!'

This was in allusion to the two first volumes of 'The Thousand and One Nights,' in which every chapter begins thus—'My dear sister, if you are not asleep, tell us one of those stories which you tell so well.'

Antoine Galland had too much sense to be angry at this sally; he began to laugh, and replying, 'Gentlemen, *au revoir!*' he closed the window, and returned to his bed, where he was not long, before he regained some of the calorific which he had lost at the window. He, however, profited by the lesson, and published all his other volumes without this exordium. Antoine Galland died at the age of sixty-nine, on the 14th of February 1715.

PROGRESS OF THE NATION.

THE social progress of individuals, families, neighbourhoods, is familiar to us all, and usually forms one of the most common subjects for our inquiries; but when such details as come within the scope of our own personal observation are multiplied, extended, and classified by mathematical minds, so as to embrace the great aggregate of the nation, the result must be a picture of the highest imaginable interest and importance. But it is a picture which comparatively few have leisure, and fewer still are qualified, to examine or enjoy in detail. The salient points are all on which the mind of the many will desire to dwell; and for this reason, we think we shall perform an acceptable service, if we take advantage of the republication of a valuable work to direct attention to the great landmarks of the national progress.* Such a service, too, will be well-timed; for in the ten years just expired, greater advances have been made than in any preceding tenth of a century. The elements of prosperity, commercial and educational, are daily taking new and more active combinations; and it is no longer heresy to consider

* The Progress of the Nation, in its various Social and Economical Relations, from the beginning of the Nineteenth Century. By G. R. Porter. A new edition. London: Murray. 1847.

the welfare of the many as better worth attention than inert and antiquated theories.

Now that the people are not regarded as the material of war—food for cannon; mere hewers of wood and drawers of water—we find them estimated at their true value in all calculations of power and advancement. A hundred years ago, wars and epidemic diseases were considered to be the natural means whereby Providence kept the human race within reasonable limits—a sort of predestinated check to undue increase. It is only from the commencement of the present century that anything like correct population returns have been obtained. The increase in the first half of last century was—omitting fractions—not more than 17 per cent.; in the second half it rose to 52 per cent. The number added to the population of the kingdom from 1801 to 1841, was 10,700,000, but in 1846, this had risen to 12,000,000; nearly as much as the whole number of inhabitants in 1811. This increase is in a ratio 3 to 1 greater than that of France, which country doubles her population but once in a century, while England doubles hers in fifty years.

In 1801, the number of marriages was 67,288; in 1840, 115,548. The number of houses in the first year of the century was 1,467,870, but in 1841 it had increased to 2,753,295, or nearly double in the space of forty years; the yearly value at the latter period was £23,386,401, in 1815 it amounted to £14,290,889. To meet the wants of the rapidly increasing population, an addition of house accommodation to the amount of £10,000,000, and 1,000,000 tons of shipping, are required annually.

With an increasing population we have a decreasing rate of mortality. In 1700, 1 in 39 died; in 1800, 1 in 47. 'This effect,' observes Mr Porter, 'so strongly indicative of amendment in the condition of the people, must be attributed to the coincidence of various causes. Among these may be mentioned the less crowded state of our dwellings, the command of better kinds of food, the superiority and cheapness of clothing, and probably also more temperate habits and greater personal cleanliness.' A large proportion of births, it is shown, is not always to be taken as an evidence of prosperity. Late inquiries have made us aware of the prodigious waste of life, particularly in large towns, which more than counterbalances the numerous births. 'Population does not so much increase because many are born, as because few die.'

The number of persons employed in agriculture has diminished, and in manufactures increased. Where formerly the labour of seven families was required to produce a certain amount of food, the same quantity is now raised by five: an instructive fact, showing that the present rate of progress in manufacturing industry may be kept up, as the tendency is to improve agriculture and augment the supply of food. Between the years 1811 and 1831, the agricultural class increased 7 per cent., and the trading and manufacturing class 34 per cent. The greatest proportion of the latter is found in the counties of Cheshire, Derby, Lancaster, Middlesex, Stafford, and Warwick: the former in Cambridge, Essex, Huntingdon, and Rutland. Mr Porter justly exposes the absurdity and injustice of the old poor-law. 'Under such a system,' he says, 'a labourer in an agricultural district was inevitably rendered a pauper; he was deprived of all means for exercising the virtue of prudence, and became almost necessarily improvident; he was brought to look upon the parish allowance as his freehold, and if, under such circumstances, any spark of independence remained unextinguished in his breast, it should have been received as evidence of a degree of innate virtue deserving of the highest admiration.'

Public opinion has now declared so decidedly against a rigid adherence to the 'workhouse test,' that we are bound to suppose there must be something in that adherence either absolutely wrong, or which jars with existing circumstances. Yet we should not be too ready to

forget the great evil of which the test was the corrector. Mr Woolley says—'Let any man see the straightforward walk, the upright look of the labourer, as contrasted with what was before seen at every step in these counties (Kent and Sussex). The sturdy and idle nuisance has already become the useful, industrious member of society. No man who has not looked well into human nature, and the practical working of the wretched system of pauperism, can form an idea how different is sixpence earned by honest industry, and sixpence wrung from the pay-table of a parish officer. I am fully convinced that the measure has doubled the value of property in many parts of the kingdom.' The saving in the expenditure for the relief of the poor in 1841, as compared with 1811, was 53 per cent. The assessments are highest in Berks, Bucks, Dorset, and Wilts; and lowest in Cumberland, Monmouth, Lancaster, and Stafford.

Among several comparative statements of the means adopted for the relief of the poor in other countries, we find returns from the pauper colonies of Holland. A few years ago, a great deal of interest was felt in these establishments; they have not, however, realised the expectations of their projectors, partly owing to the very inferior quality of the soil on which they are placed, and the great expense attendant on the first settlement of poor families; neither have they sensibly diminished the amount of pauperism with which Holland is oppressed more than any other country in Europe. According to a report published in 1827, paupers comprised one-fifth of the population of the United Netherlands. The effect of isolated pauper communities is said to be bad. 'Without the example of the better conditions of society, there can be no hope of such a community gradually acquiring those qualities that would fit the members of it for a better condition also.' Every statement shows that English labourers earn nearly double wages to those of other European countries.

Under the head of consumption, we learn that, since the beginning of the reign of George III., 7,076,610 acres have been brought under cultivation; and although the proportion has somewhat diminished in the last forty years, yet such is the improvement in agriculture, that 10,000 acres of land which, on the old method of cultivation, supported but 3810 individuals, now maintain 5997. Mr Porter considers that, for a long period, population is not likely to increase in a greater ratio than the supply of food. 'It has been affirmed,' he observes, 'that in Wales the land does not produce half of what it is capable of producing; and that if all England were as well-cultivated as Northumberland and Lincoln, it would produce more than double the quantity that is now obtained . . . and when at length the increase of population shall have passed the utmost limit of production, there can be no reason to doubt that we shall still obtain, in full sufficiency, the food that we shall require.'

The greatest progress is seen in manufactures: the exports of woollen goods, which in 1829 were between four and five millions, now exceed £8,000,000 annually. Between the years 1835 and 1839, one hundred and thirty-two woollen and worsted factories were built in addition to those already existing, and the increase of operatives in those branches of industry for the same period was 15,137. It is well known that the population of some of the Yorkshire towns, the principal seat of the woollen trade, has more than doubled since the commencement of the century.

During the last forty years, a great improvement has taken place in the growth of wool. Sheep which produce long or combing wool have been almost everywhere introduced, while short-wooled sheep have correspondingly declined in numbers. Much of the short wool, it appears, could find no market, but for the importation of long foreign wool to mix with it; there is, however, a still more remarkable importation for this purpose. 'A curious trade,' says Mr Porter, 'has of late years been introduced, that of importing foreign

woollen rags into England for the purpose of re-manufacture. These are assorted, torn up, and mixed with English, or more commonly with Scotch wool of low quality, and inferior cloth is made from the mixture, at a price sufficiently moderate to command a sale for exportation. By this means a market is found for wool of a very low quality, which otherwise would be left on the hands of the growers.

In 1801, 54,303,433 pounds of cotton were imported; but so unparalleled has been the increase in this branch of trade, that the quantity entered in 1844 was 554,196,602 pounds. In the same year the value of cotton goods exported was £25,805,348, having increased from £16,516,748 in 1820. Two pieces of calico per week was the utmost a hand-loom weaver could produce; but the steam-loom weaver of the present day produces, with an assistant, twenty-two such pieces in the same space of time. The article of bobbin-net employs nearly two hundred thousand persons in its manufacture, at an annual expenditure in wages of £2,500,000. The linen trade of Ireland has shared in the general expansion; the value of linen goods exported having advanced in the first quarter of the century from £34,000,000 to £55,000,000.

A glance at the tabular statements sufficiently proves that peace is essential to national prosperity. No sooner do we approach a war season, than disturbance and diminution at once appear in the aggregates of quantity and value. Even if no higher motives existed, this alone should be treated with due consideration ere the expensive injustice of war is adopted. Increased production necessarily leads to an abatement of prices; but glass was for many years an exception to this rule. The trade was so overloaded with duties, as to be a virtual monopoly; and the manufacturers were hampered and harassed in every way by absurd excise regulations. An ingenious proprietor, 'who had succeeded in making great improvements in the quality of bottle-glass, was stopped in his operations by the excise officers, on the plea that the articles which he produced were so good in quality, as not to be readily distinguished from flint-glass.' Not the least pleasing, however, among the signs of progress, is the removal of such restrictions. The abolition of the glass duties by the legislature in 1845 has done everything for the relief of the trade, which will doubtless expand in proportion to those we have above enumerated.

Travelling, roads, and the iron trade, occupy an interesting section of the work; the benefits they confer are seen to be gradually diffusing themselves through every class of society. Something yet remains to be done for greater cheapness in the carrying of passengers and goods: with respect to the latter, we read that 'the charge made for the cartage of a puncheon of rum from the West India Docks to Westminster, exceeds the charge that would be made for conveying the same puncheon from those docks to Hamburgh!' Among the various schemes for expediting and cheapening the delivery of parcels in the metropolis and the provinces, it is to be hoped that less expensive transport of heavy goods will not be lost sight of. The progress of steam-navigation is striking. In 1814, the United Kingdom and colonies owned but 2 steam vessels; in 1815, they had 10; in 1820, 43; in 1830, 315; and in 1844, 988. Scotland, which took the lead in steam navigation, has ever since shown a large proportional list of vessels. Of the above 988, England had 679, Scotland 137, Ireland 81, Guernsey, &c. 3; and the colonies 88. The total burden was 125,675 tons. The number of steam vessels in all the world besides, is stated in another table at 719, of which the United States had 261, and France 119. It thus appears that Scotland has more steam vessels than all France. Mr Porter discusses the questions of finance, carriage, public income and expenditure, wages, taxes, &c. taking occasion to show the great improvement that has taken place in the physical condition of the people, and the disappearance of some of many unfortunate inequalities among the

classes. 'This improvement,' he says, 'is by no means confined to those who are called, by a somewhat arbitrary distinction, the working-classes, but is enjoyed in some degree or other by tradesmen, shopkeepers, and farmers; in short, by every class of men whose personal and family comforts admitted of material increase.'

Less than fifty years ago, some of the tradesmen in the chief thoroughfares of London had no carpets to their floors—no books or pictures—none of those useful or ornamental objects which add so materially to the charm of domestic life. Sheffield is noted for the comfortable manner in which the houses of the industrial population are furnished, although the town itself is not better built or laid out than others. From whatever cause this attention to in-door arrangements may arise, it is one that should be encouraged; and a disposition that way may be classed among the evidences of progress. In connection with household reports, it may be mentioned that the expenses incurred for domestic servants in 1841 amounted to £38,222,620.

The author goes on to treat of all excisable articles: every year's experience confirms the fact, that increased consumption follows diminished price. The true policy of government, he contends, should be to collect no other custom duties than what are required for revenue. Turning to the details respecting crime, we find it intimated that although our disposition is to magnify every present evil, yet we are not proportionately worse off in this respect than our forefathers were. The exploits of highwaymen are within the recollection of persons now living: merchants who lived in the suburbs of London dared not go home from their counting-houses in the evening alone. A certain place was fixed on as a rendezvous where they met, and whence, for mutual protection, they returned in a body to their residence. Individuals were knocked down in the streets, and robbed in broad daylight; no one could ride on the roads in any direction unless well prepared to repel the attack of robbers, or to run his chance of being murdered. However strange it may seem, there are fewer offences against property now than in the days of our forefathers. More perfect police arrangements, better lighting of streets, readier means of communication, have done more towards the repression of crime than all the sanguinary laws of the last century. The diminution in the number of capital punishments is perhaps the most hopeful indication of moral progress. Not more than twenty-five years ago, it was not at all uncommon to hang one hundred criminals in the course of twelve months. From 1805 to 1825 there were one thousand six hundred and fourteen executions; from 1825 to 1845 six hundred and twenty-six. Of the latter, one hundred and eleven have been hanged in the last ten years—less than the number executed in 1813 alone.

The ameliorating effect of education is shown in a series of tables, and the value of good instruction insisted on as the best preventive of crime. But, as Mr Porter observes, there must be something beyond the mere ordinary branches of school learning 'to render our prisons useless, and shut up our courts of justice. In communities where the great mass of the people are left in ignorance, and only a few comparatively instructed, those few will find themselves in a far better position than the mass for obtaining honest employment, and thus will have fewer temptations to withstand. If all were equally instructed, this condition of course could not exist, and then we might be better able to estimate at its true value the moral influence of instruction. Knowing what we know of the quality of education, as it has usually been imparted to the youth of this country, dare we hope that its restraining influence would be great? It is true we might even then expect to put an end to much of the violence and fraud, by which the community is now disgraced. Merely instructed persons would better calculate the worldly advantages and disadvantages of right and wrong con-

duct; and who can estimate how much of crime, and consequent misery in the world, result from miscalculation! But further—is it not certain that an instructed community would be able to apply its energies more beneficially for the whole than is possible where general ignorance prevails? that employments would be more certain and more profitable, and temptations to dishonesty fewer and weaker?’

The general spread of intelligence has contributed powerfully to the improvement of manners. The brutal sports and disgusting conversation of former days would not now be tolerated. And although we are far from disguising the evils that yet remain, we cannot but see that education has produced something like general enlightenment. In its further advances, the population will learn to discriminate between real and imaginary evils, and the authority of fallacies will disappear. Mr Porter contends that there is no cause for alarm in increase of numbers, and inquires—Why, then, shall we not go forward to double, and again to double, our population, to safety, and even to advantage, if, instead of rearing millions of human *clods*, whose lives are passed in consuming the scanty supplies which is all that their lack of intelligence enables them to produce, the universal people shall have their minds cultivated to a degree that will enable each to add his proportion to the general store?’

These are sound views, and we gladly assist in giving them wider diffusion, feeling that they must assist the progressive movement. We commend Mr Porter's book to all interested in national progress, and who regard our present activity as an earnest of yet better things. His official position enables him to give correct information on the multifarious topics brought under consideration.

THE NEMESIS AND CHINESE WAR.

On the 25th of November 1840, an extraordinary visitor was seen approaching the town of Macao, in the Canton river. This was a large two-masted steamer of 630 tons burden, long, sharp, and narrow at the beams, rising only a few feet above the water's edge, and with a pair of staring eyes painted on her bows. The inhabitants came down in crowds to the esplanade to gaze at this singular specimen of naval architecture, and did not wonder the less when they saw, by the salute of the Portuguese flag, that she was a personage of consequence. The stranger dashed through the Typa anchorage without any apparent intention to bring to, and the startled governor at length sent off a messenger to warn her that the water nearer the town was only deep enough for trading boats. But this was nothing to the demon ship, as she was afterwards named by the Chinese; and flashing through the shallows, she ran almost close under his excellency's house, and while gliding past like a spirit, thundered a salute, which was echoed by the screams of the ladies who crowded the windows. Such was the first appearance of the *Nemesis* in the Chinese waters. It may be considered somewhat late in the day for us to notice her exploits, the book which chronicles them having already reached its third edition;* but in doing so we have ulterior views, desiring, by means of the surprise and interest excited by the ship, to lead the attention of our readers to the war, the prospect of which had called her, like a bird of prey, to the scene.

The Chinese war, of which the appearance of this vessel may be said to have formed the commencement, was, as everybody knows, the result of gross cupidity in European nations. The indignities to which they habitually submitted, for the sake of a trade which was still more important to the Chinese than to themselves, led the Celestial people to suppose them to be really the barbarians they were called in the imperial edicts; and when

it was finally determined by the former to stop the contraband importation of opium, they managed the affair in so haughty and tyrannical a manner, that European patience gave way all on a sudden. The pretence was a moral one; but, in reality, opium had become the article of foreign produce which turned the balance of trade against the Chinese, and seemed to impoverish the country by draining it of its silver. The Chinese government, instead of legalising and taxing a traffic which it could not prevent, and which was shared in by its own functionaries from the highest to the lowest, seized arbitrarily upon the persons of the English officers and merchants at Canton, and compelled them to surrender the whole of the opium in the Chinese waters, to the amount of 20,283 chests, and of the estimated value of two millions and a-half sterling. This was the true cause of what will be stigmatised in history as the Opium War.

When the conflict fairly commenced, the iron steamer *Nemesis* with her redoubted captain—Hall—dashed into the thickest of it. She was called, it will be observed, after the vengeful daughter of Jupiter and *Necessitas*, whose ire was chiefly provoked by the proud and boastful. And well did she vindicate her claim to the name! After astonishing the upper fort of Chuenpee with her shells—which appeared to the unhappy Chinese as very fit missiles to come from such a quarter—she ran close up to the sea battery, and poured through the embrasures destructive rounds of grape as she passed, and then looked round for some mode of service not accessible to ships of ordinary mould. The enemy's fleet was anchored in concealment within the entrance of a little river, where the shallowness of the water (little more than five feet) seemed to secure them from our vessels; but no sooner did the *Nemesis* get an inkling of their hiding-place, than she sprang towards it, and with such headlong haste, that she struck upon a reef of rocks as she passed. But this was nothing to her, since she managed to get over in any way; and coming bounce upon the junks, she sent a rocket into one of the largest of them, which blew her up, says our author, 'with a terrific explosion, launching into eternity every soul on board, and pouring forth its blaze like the mighty rush of fire from a volcano. The instantaneous destruction of the huge body seemed appalling to both sides engaged. The smoke, and flame, and thunder of the explosion, with the fragments falling round, and even portions of dismembered bodies scattering as they fell, were enough to strike with awe, if not with fear, the stoutest heart that looked upon it.' A momentary pause ensued, and no wonder; but this did not last long. The junks made off as fast as they could, some of them bumping ashore, some vanishing in creeks, but all pursued by the demon ship, clawing them out with her grappling-irons, and setting fire to them; while their shotted guns, as they burned, went off, and added to the strangeness of the scene. She then hastened up the river for three miles in successful pursuit of additional prey; the inhabitants scouring off in all directions, till they gained the summits of the neighbouring hills, whence they looked down in terror upon the progress of this destructive engine. Some notion of the astonishment of the junks may be obtained from the fact, that they were provided with nets to catch our small boats, the only visitors they expected in such a place!

The next appearance of the *Nemesis* is when passing through the Bogue, during a truce, and saluted by the forts on both sides; the Chinese, with their silken flags and strange costumes, looking down upon her from the crowded battlements. But even here she could not refrain from a little piece of devilry; for as she neared Tiger Island, she sheered in close alongside the battery till her yards touched the stones, as if admonishing the garrison, with an impudent leer, that she could batter the walls to pieces if she chose, while their guns would thunder harmlessly over her head. The hint was taken afterwards, and the useless fort abandoned. The security arising from this light draught of water was strikingly exemplified at the celebrated attack of these same Bogue

* The *Nemesis* in China, comprising a History of the Late War in that Country; with a Complete Account of the Colony of Hong-Kong. From the Notes of Captain W. H. Hall, R.N., and the Personal Observations of W. D. Bernard, Esq. A.M. Oxon. Third Edition, revised and improved. London: Colburn.

forts; the *Nemesis*, in order to save herself from the shot of the batteries, running ashore, and thus hanging with her head completely out of water, and her stern deep in the river.

But the voyage of the *Nemesis* up the back passage from Macao towards Canton, by what is called the Broadway, is the most remarkable, as well as the most useful of her exploits. The Broadway, though sometimes mentioned as a distinct stream, appears in reality to be merely a narrow, tortuous, and shallow channel of the Canton river. In addition to its natural protections from everything but small craft, it was strongly fortified throughout its whole length; and the idea of forcing such a passage, in the heart of a hostile country, by means of a single steamer and two ships' boats, was one of the most daring that can be conceived. But on went the *Nemesis*, 'nothing daunted by mud, sand, or water, or even by the shallowness of the river,' till she reached a fort, which she captured and burned. Another fort, and likewise a military depot higher up, met the same fate. 'They had ascended a very little way further up the river, when, to the joy of every one, they espied nine war-junks under weigh, a considerable distance ahead, and chase was given at full speed, in spite of all obstacles of the navigation. The interest and excitement momentarily increased, as every mile they advanced served to lead them to the conclusion that the Chinese were better prepared for defence than had been at all expected. Indeed it was not a little remarkable that a passage never before explored by foreigners should have been found in a state of preparation against attack, by forts of old-standing and solid construction, as well as by works of recent and temporary formation.'

On went the *Nemesis*, till she had the satisfaction to see the runaway junks at a stand-still, determined to dispute the passage. It is true they were protected by a considerable fort on one side, a field-work on the other, and a fence of stakes across the river in the middle; but all this was nothing to the demon ship. The stakes were quickly passed, the batteries destroyed, and seven of the junks set on fire and blown up. It was necessary to pursue the remaining two; and in process of time the invaders found themselves quietly passing through a large and populous town. 'The people crowded upon the banks of the river; the house-tops and the surrounding hills were covered with curious gazers, wondering what strange event would happen next. Hundreds of trading-junks, and boats of various kinds, most of them the sole home of their owners, were crowded together on both sides of the river throughout the town, and even above and below it. The river was narrow, and so densely were the boats packed, that the only passage left was directly in the centre of the stream, where, as if by mutual consent, a clear way had been left, only just broad enough to allow the steamer to pass, and requiring some dexterity to avoid running foul of the junks on either side.'

On went the *Nemesis*; and by and by one of the fugitive junks was overtaken and burned, and a masked battery stormed and destroyed. She had been at work ever since three o'clock in the morning, and it was now getting dark, and the river becoming more and more shallow: she therefore anchored for the night—in a stream so narrow, that it was impossible to turn her head round—with devastation behind, unknown enemies before, and surrounded by a mighty population, into whose bosom she had carried insult and death. The next day 'she had seldom more than six feet water, and in many places only five, so that she was frequently forced through the mud itself. There was not room to turn her fairly round, and the only mode in which she could be managed was by sometimes driving her bows as far as possible into the river's bank, sometimes her stern, while at other times it was hard to say whether she was proceeding over a flooded paddy-field, or in the channel of a water-course. This gave occasion to a facetious remark, in which sailors sometimes delight, that this "would be a new way of going overland to England." New forts, new fighting, new burning; and, worst of all, new stakes, with sunken junks between their lines. These were surmounted with difficulty; and it 'was only

accomplished after four hours' hard work, in which, oddly enough, the Chinese peasantry bore an active part, voluntarily coming forward to assist, and even venturing to come on board the steamer itself.' In the course of this day a large mandarin station was destroyed, and she came to anchor for the night. The next morning she arrived at another large town, where she set fire to the custom-house, and blew up the object of her pursuit—the remaining junk. Beyond this the river became still more narrow and shallow; and the *Nemesis*, at length turning into a lateral passage, threaded her way to the main Canton river, where she emerged just below the second bar.

Her intrusions with the fire rafts of the Chinese, it may well be supposed, were quite in her own way. These rafts were composed of boats filled with all kinds of combustible materials, and connected by long chains, so that, in drifting down the river, they might hang across the bows of our ships. The business of the *Nemesis* was to tow these away, or otherwise frustrate their intentions; and it 'was a grand spectacle, in the sullen darkness of the night, to see these floating masses of fire drifting about the river, and showing, by their own reflected light, the panic-stricken parties of Chinese who had charge of them trying to escape towards the shore, which few of them were destined to reach. Some threw themselves overboard, were carried down the stream, and their struggles were soon ended; others were shot at random by our musketry the moment they were discovered by our men, betrayed by the light of the fires they had themselves kindled.' Another extraordinary towing service was performed when she moved up to Canton with the whole of our troops at her tail. 'The enormous flotilla of boats, including of course those belonging to the men-of-war, necessarily retarded the progress of the steamer very much, particularly in the more intricate parts of the river. As she advanced, numerous boats from our ships were picked up, until their number could not have been less than from seventy to eighty; hanging on behind each other, and following in the wake of the long low steamer.'

But the adventures of the *Nemesis*, we are grieved to say, form almost the only portion of the war that is capable of being represented in such a light as ought to inspire any other feeling than horror and indignation. After the very first serious collision, there was no room for the boast of 'valour' which is expected to cover so many sins. The Chinese, with all their might of numbers, were found to be no match for us; and the struggle from first to last resembled that of a handful of determined men with a crowd of poor little boys. The unwieldy junk, opposed to vessels like ours, was merely a machine for caging helplessly up a certain number of human beings to be shot at, drowned, and burned alive at the pleasure of their enemies. 'In some of the junks,' says the author of the *Nemesis* in China, 'which were not yet quite abandoned by their crews, the poor Chinamen, as the English sailors boarded them on one side, rushed wildly over on the other, or let themselves down by the stern chains, clinging to the ship's rudder. Others, as the fire gained upon their junk, retreated before it, and continued hanging to the yet untouched portions, until, the flames advancing upon them rapidly, they were obliged to throw water over their own bodies to enable them to bear the intense heat, still desperately clinging to their fate, more from fear of ill treatment if they should be taken prisoners, than from any rational hope of being saved. In many instances they *would not* be saved; in others they *could not*, and were destroyed as their junk blew up.' Bad powder, bad gunnery, and almost entire ignorance of the art of fortification, in other cases completely neutralised all apparent advantages.

The Chinese, not accepting quarter, though attempting to escape, were cut up by the fire of our advancing troops; others, in the faint hope of escaping what to them appeared certain death at the hands of their victors, precipitated themselves recklessly from the top of the battlements; numbers were now swimming in the river, and not a few vainly trying to swim, and sinking in that effort; some few, perhaps a hundred, surrendered them-

selves to our troops, and were soon afterwards released. Many of the poor fellows were unavoidably shot by our troops, who were not only warned with the previous fighting, but exasperated because the Chinese had fired their matchlocks at them first, and then thrown them away, as if to ask for quarter; under these circumstances, it could not be wondered at that they suffered. Some of them, again, barricaded themselves within the houses of the fort—a last and desperate effort; and as several of our soldiers were wounded by their spears, death and destruction were the consequence.* This may serve as a general picture. A few wounds were the excuse for the sacrifice of hundreds of lives! On the same occasion (at Chuenpee), we are told by Ouchterlony that 'about four hundred dead and dying lay in and about the fort when the firing ceased. In one particular spot, where the rock rose with a steep slope behind some military buildings, the corpses of the slain were found literally three and four deep—the Chinese having been shot while trying to escape up the hill, and having rolled over, until this ghastly pile was formed.'* The loss of the British amounted to thirty-eight men wounded—many of them by the accidental explosion of a field magazine after the struggle!

At the capture of the famous Bogue forts the British had five men slightly wounded, and the Chinese five *hundreds* killed and wounded! The British force under arms before Canton amounted to 2200 men; while within the city, defended by its hitherto inviolate ramparts, were, at the lowest calculation, 20,000 Chinese. Of the former, the loss in killed, wounded, and missing, during the whole series of operations, fell short of 130 men; while some accounts—though supposed by Ouchterlony to be exaggerated—state that of the Chinese at 6000! In the expedition of the *Nemesis* up the Broadway, no mention is made of the number of the enemy killed; but the following is the other result:—'The whole loss on our side during this adventurous trip was only three men wounded. Altogether, one hundred and fifteen guns were destroyed, together with nine war-junks, and several armed mandarin-boats; six batteries, and three government chop-houses or military stations, together with barracks and magazines, were also taken and set on fire.' At a fort near the Brunswick Rock, below Whampoa, the Chinese lost three hundred in killed and wounded; the British eight wounded and one killed!

The butchery at Chinhae furnishes a specimen of meaningless ferocity which is perhaps unparalleled in the annals of war. The city was taken by escalade without resistance, and the only legitimate object, therefore, was to disperse the Chinese troops that were posted in the neighbourhood. These fled before a column of the British, and made for a bridge of boats, with the view of escaping over the river; but in doing so, came suddenly upon another column. 'It is not difficult,' says Ouchterlony, 'to conceive the scene which ensued. Hemmed in on all sides, and crushed and overwhelmed by the fire of a complete semicircle of musketry, the hapless Chinese rushed by hundreds into the water; and while some attempted to escape the tempest of death which roared around them, by consigning themselves to the stream, and floating out beyond the range of fire, others appeared to drown themselves in despair. Every effort was made by the general and his officers to stop the butchery; but the bugles had to sound the "cease firing" long and often before the fury of our men could be restrained. The 55th regiment and Madras rifles having observed that a large body of the enemy were escaping from this scene of indiscriminate slaughter along the opposite bank of the river, from the citadel and batteries which the naval brigade had stormed, separated themselves, and pushing across the bridge of boats, severed the retreating column in two; and before the Chinese could be prevailed upon to surrender themselves prisoners, a great number were shot down, or driven into the water and drowned.'

In the attempt of the Chinese to recapture Ningpo,

they lost from five to six hundred men, while on our side only a few were wounded, and not a single man killed. Yet the English were so much 'exasperated,' that they pursued the flying enemy for seven or eight miles—not to take prisoners, but to slay! At Tscke, the English had three men killed and eighteen wounded; the Chinese, including killed, drowned, and wounded, nearly a thousand! At Chapoo, the English had ten killed and fifty wounded; while 'of the enemy,' says Ouchterlony, 'the number left dead, or to die, on the field could not have been less than five to six hundred; and many more perished after the close of the action by suicide, or from the effects of their undressed wounds.' We could carry these instances much farther: we could show that, throughout the war, the Chinese were slaughtered by our countrymen as cattle are slaughtered by butchers, not as men are slain in equal conflict by men; and that in various instances, when the panic-struck wretches fled in helpless crowds to the shore, they were there met by the guns of our 'gallant tars,' who, without the excuse even of the brutal excitement of the pursuit, poured murder into the unresisting mass! But we have space for only one more incident of this sickening war.

At the attack on the town of Chapoo, the Tartar garrison, in order to give themselves a chance of preserving the sanctity of their homes, came out to meet the assailants, and posted themselves upon the heights in the neighbourhood. From this position they were scattered like chaff—too easily to admit of much slaughter; but the fugitives were 'fortunately' met in the hollow by another division of the British troops, and thinned to some purpose! A party of them, however, amounting to three or four hundred, could not be said to fly. When all was lost on the heights, they marched towards the town in good order; and when they saw their retreat cut off, took refuge in a building which had only a single entrance, conducting, as usual, to the square court round which the apartments of Chinese houses are ranged. A screen of masonry in the interior, before the entrance, prevented a view of the court from the outside; and here, therefore, the Tartars awaited, silent and unsees, the attack of their enemies.

The English entered the building with their customary gallantry, but were repulsed by the ambushed Tartars with some loss of blood, and the death of one officer. They withdrew to the outside, and threw rockets over the walls into the court; but these were received with cheers of defiance. A field-piece was then brought to bear upon the house; and at length a fifty-pound bag of powder, placed at the bottom of the wall, opened a wide breach by its explosion. The assaulting party, however, were driven back with loss by the courageous Tartars, who had now, under such accumulated horrors, sustained a siege of three hours. But by degrees they lost hope, and some of them took advantage of the retreat of the storming party to endeavour to escape. These were shot down like wild beasts. We give the conclusion in the words of Ouchterlony:—

'It was now resolved to set fire to the building, and a second breach having been blown in the opposite side, some wood was collected, and a fire kindled, which soon spread to the roof, composed of dry, light pine-rafters and beams, and in a short time the house was reduced to ruins. Some fifteen or sixteen of the enemy, who became exposed by the throwing down of a portion of the outer wall, were destroyed by a volley from without, and on our troops being at length suffered to enter within the smoking and shattered walls, they found that all resistance had ceased. But few of the Tartars were bayoneted after the joss-house had been carried, and the survivors, most of whom were found crouching on the ground, with their arms folded, and their matchlocks and swords laid aside, in evident expectation of a violent death, and with a manifest resolution to meet it as became men, were taken out, and shortly after set at liberty. Of the whole body, however, who had originally taken post in the fatal joss-house, only sixty were made prisoners, many of them wounded, all the rest having been shot, bayoneted, or burned in the fire which consumed the building: the last

* The Chinese War: an Account of all the Operations of the British Forces from the Commencement to the Treaty of Nanking. By Lieutenant John Ouchterlony, F.G.S. Saunders and Otley.

must have been the fate of many of the wounded, whose forms, writhing in the agonies of so frightful a death, were seen by the troops outside, who were unable to afford them succour.'

We might close this catalogue of terror by a picture of what took place at Chapoo and other towns, where the conquered slaughtered their wives and children to prevent their falling into the hands of the victors. But the guilt or frenzy of the Tartars has nothing to do with our present purpose, which tends merely to strip this truly diabolical conflict of the false lustre which has been thrown around it, and to awaken the people of Great Britain to a sense not only of the sin and horror, but of the foul disgrace of war.

But although the carnage we have described cannot be defended on moral grounds, it had at least this political advantage, that it abridged the conflict. By the time the British had penetrated to the Imperial Canal, the grand artery of the internal traffic of the country (which they ought to have done long before), there was no army to oppose to them. Many thousands of the Tartar troops had been butchered in detail, and the remainder had no stomach for an enemy so irresistible and so ruthless. When the Fanqui, therefore—the 'wandering demons' of Europe—had severed the empire in two, by grasping the canal, which is the medium of communication between the centre and the capital, they found that a nation which comprehends one-third part of mankind had absolutely no troops to meet them in the field! The last place they had captured, Chin-keang-foo, was a city of the dead—an abode of unimaginable horrors, where the air was poisoned with the swollen and blackened corpses of its inhabitants, and from which even the gorged plunderers, Christian and heathen alike, fled aghast, leaving the wild dogs to their hideous banquet. Nanking, the second city of the empire, was the next object of the conquerors; but here the courage of the Chinese at length gave way. Matters were easily arranged, for the English as yet wanted no territory of special importance. They had an eye, however, to what *might come*, and demanded one little island, large enough to hold their foot—which was conceded: By a treaty dated the 29th August 1842, Hong-Kong was ceded to the crown of Great Britain, five other ports were thrown open to trade, and twenty-one million dollars were agreed to be paid. The indelicate subject of opium was not alluded to at all!

STURROCK ON LIFE-ASSURANCE.

WITHIN the compass of a small pamphlet,* Mr Sturrock discusses very ably the principles and practice of life-assurance, using such terms as all can understand.

Observing the ignorance generally displayed by individuals who apply at life-assurance offices, he very properly sets out with explanations. 'The person applying to any office to get his life insured, must, as a preliminary and indispensable step, satisfy the company that his life is, in common phrase, a good one—or, in other words, that the state of his health and constitution is such as to make the company believe that he will live to the average age—that is, to the age which persons at his time of life generally attain. For this purpose he is required to sign a proposal to assure, and to give a reference to his medical attendant and to an intimate friend, who have known his state of health and habits of life for a number of years, and who must report thereon to the assurance office. In addition to the evidence thus required to be furnished by the person proposing to effect the insurance, the company, for their further security, employ a medical officer to make inquiries, and use such other means as they deem proper, that they may completely satisfy themselves of the goodness of the life offered for insurance. If the result of the inquiry is unsatisfactory, the assurance is rejected; but if it be in every respect satisfactory, and

lead to the conclusion that the life of the applicant is really a good one, the assurance is accepted. The assured then agrees, on the one hand, to pay to the company, according to his age at the time of entry, a certain fixed sum (or premium) during every year of his life; and the company, on the other hand, bind themselves to pay to his representatives, on the occasion of his death, at whatever time it may happen, another much larger fixed sum. These are the usual terms of the assurance contract; but they may be varied to suit the views of the different assurers.'

In the middle ranks of life, few have much capital to stand for the benefit of their families, in the event of their early decease; but most have incomes. By devoting a portion of the latter in the way of life-assurance, the head of a family can make sure that, die when he may, even were it the day after his first annual payment, his widow and children will be endowed with a certain amount of means. Life-assurance is therefore one of the humane agencies attendant upon our present system of civilisation, and it ought to be encouraged by all philanthropic persons. There are, however, many modes of conducting this business, some half-obsolete and bad, others more fair and advantageous, and it may therefore be of much importance to an individual that he chooses a right office.

Mr Sturrock, like ourselves, condemns the proprietary companies. In the infancy of the system, capital was necessary, and a remuneration for its risk was fair. Now, the absence of all risk being ascertained, life-assurance is no fit subject for mercantile speculation. 'When such companies,' says Mr Sturrock, 'are announced to the public (and the principle applies equally to pure or mixed proprietary companies), the greedy capitalist is eagerly invited to become a partner, by showing the universally large profits such companies make, and that the stocks of similar societies are selling in the public market at profits from one to some hundreds per cent. As soon as the company is established, such public announcements of profit immediately stop. It is no longer how profitable are such investments, but the constant tale to the public is, see what a large capital we are risking for your benefit. Such a procedure is, to say the least of it, an outrage upon common sense. Will not the public see that the large profits these companies announce, and pay to the shareholders, is just the measure of the gain taken out of their pockets—it is not too strong to say, upon false pretences?' What use of mincing terms? A proprietary life-assurance office is a mercantile lie, and nothing else. Let such, we say, be avoided. Even those called Mixed Offices, which admit assurers to a share of benefits, are only reprehensible in a less degree. It is the more necessary to speak strongly, because the keenness of a trading interest makes these companies extremely active, and they usually secure a proportion of business in the inverse ratio of their deserts.

The purely Mutual Offices—those which divide the whole surpluses amongst the assured—are alone entitled to encouragement. Mr Sturrock discusses with much acumen the various arrangements of these offices with regard to rates and bonuses. He places the true nature of bonuses in a clear light—not as the result of profits, as is generally said, but of an over-high system of rates, arising from the employment of tables which give unfavourable views of human life. To insure £1000 in some of the old mutual offices, the sum demanded from a person of thirty years of age is £35, 10s. 10d.; other offices, which are flourishing, demand only £20, 15s.; while the experience of many shows that the sum rigidly required, under existing circumstances, is no more than £16, 19s. 5d. Of course, when an assurer gets a bonus, he only gets back what he had paid more than enough, minus the expenses of business. It is necessary, however, for the sake of caution, to exact rates which leave something for contingencies; and hence it were wrong to expect the £1000 to be insured at thirty for £16, 19s. 5d. Granting that some moderate sur-

* The Principles and Practice of Life-Assurance. By John Sturrock, Junr. Dundee: 1846.

phage should be taken, the question arises, In what way should this be disposed of?

This Mr Sturrock calls an unsolved problem. We must say, with deference, that we can see no objection to periodical divisions among the assured, according to the usual methods. The bonus, indeed, if allowed to lie in the society's hands, becomes virtually the basis of a new assurance, whether the member be then eligible in point of health or not: he may be ineligible; but it is a contingency open to all from the beginning, and therefore unfair to none. An office of which Mr Sturrock speaks favourably, and which we ourselves regard with respect, reserves all surpluses for those who have lived so long as to pay in as much as they are assured for. But this we think objectionable, for more than one reason. In the first place, the member who dies before he has paid in so much, is, in reality, no source of loss to the society, as is assumed. All took their chance on the strength of the annual payment. If that be in excess even to a shilling, the shilling belonged to the assurer, and he is entitled to get it back, whenever the whole contingencies of the year, or whatever other period may be agreed upon, are discharged. To speak of loss from a short-lived member, is to depart entirely from the principle of life-assurance, and pass into that of a bank deposit, which is quite a different thing. In the second place, the remote postponement of bonus is discouraging. A certain moderate indefiniteness of prospect is agreeable to our nature, and it is a pity not to take advantage of this feeling as an inducement to make men insure. We venture to say that this plan will not be extensively adopted, nor will it be endured beyond the first experiences of the enormous, and, as we think, unjust advantages which it will throw into the hands of the long-lived few.

FORTUNES MADE BY ADVERTISING.

On this subject we find the following amusing particulars in a late number of the 'Pictorial Times.' For obvious reasons, we suppress the name of the quack alluded to:—

'From a small pamphlet, entitled "The Art of Making Money," an extract has been taken, and is going the round of the provincial press, pointing out the facility of making immense sums by the simple process of continuous advertising. Doubtless large sums have been, are, and will be made by such a system by certain persons of ability, who no doubt would make their way in the world if called upon to play different parts on the great stage of life; but to suppose that men in general must, as a matter of course, acquire wealth by such means, is as absurd as to imagine that all the penniless and shoeless of London are capable of rising to the dignity and wealth of an alderman or the lord mayor of London simply by reading the "Young Man's Best Companion." Money is not so easily made as the writer of the article referred to would lead people to suppose: if it be so, few need be poor. But to our text: fortunes made by advertising. Undoubtedly the greatest man of the day as an advertiser is —, who expends the enormous sum of twenty thousand pounds annually in advertisements alone: his name is not only to be seen in nearly every paper and periodical published in the British Isles, but, as if this country was too small for this individual's exploits, he stretches over the whole of India, having agents in all the different parts of the upper, central, and lower provinces of that immense country, publishing his medicines in the Hindoo, Oordoo, Goozratee, Persian, and other native languages, so that the Indian public can take the pills, and use his ointment, according to general directions, as a Cockney would do within the sound of Bow-bells. We find him again at Hong-Kong and Canton, making his medicines known to the Celestials by means of a Chinese translation. We trace him from thence to the Philippine islands, where he is circulating his preparations in the native languages. At Singapore he has a large dépôt: his agents there supply all the islands in the Indian seas. His advertisements are published in most of the papers at Sydney, Hobart Town, Launceston, Adelaide, Port-Philip, and indeed in almost every town of that vast portion of the British empire. Returning homewards, we find his pills and ointment selling at Valparaiso, Lima,

Callao, and other ports in the Pacific. Doubling the Horn, we track him in the Atlantic: at Monte Video, Buenos Ayres, Santos, Rio de Janeiro, Bahia, and Pernambuco, he is advertising in those parts in Spanish and Portuguese. In all the British West Indian islands, as also in the Upper and Lower Canadas, and the neighbouring provinces of Nova Scotia and New Brunswick, his medicines are as familiarly known, and sold by every druggist, as they are at home. In the Mediterranean, we find them selling at Malta, Corfu, Athens, and Alexandria, besides at Tunis, and other portions of the Barbary states. Any one taking the trouble to look at the "Journal" and "Courier" of Constantinople, may find in these, as well as other papers, that —'s medicines are regularly advertised and selling throughout the Turkish empire; and even in Russia, where an almost insurmountable barrier exists, the laws there prohibiting the entrée of patent medicines, —'s ingenuity has been at work, and obviates this difficulty by forwarding supplies to his agent at Odessa, a port situated on the Black Sea, where they filter themselves surreptitiously by various channels into the very heart of the empire. Africa has not been forgotten by this indefatigable man, who has an agent on the river Gambia; also at Sierra Leone, the plague spot of the world, the inhabitants readily avail themselves of the ointment and pills. Thus we can show our readers that — has made the complete circuit of the globe, commencing with India, and ending, as we now do, with the Cape of Good Hope, where his medicines are published in the Dutch and English languages; and while speaking of Dutch, we have heard that he has made large shipments to Holland, and is about advertising in every paper or periodical published in that kingdom. We might add that he has also started his medicines in some parts of France: in some portions of Germany: as also in some of the Italian states. We have been at some little trouble to collect all these facts, because we fear that the article before alluded to, "The Art of Making Money," is calculated to lead people to spend their means in the hope, as the author states, of making a hundred thousand pounds in six years for his pains, by holding up as an easy example to follow such a man as —, who is really a Napoleon in his way. Many may have the means, but have they the knowledge, ability, energy, judgment, and prudence necessary? Failing in any one of these requisites, a total loss is certain. — is a man calculated to undertake any enterprise requiring immense energies of body and mind. No doubt he has been well repaid for all his labours; and is, we should suppose, in a fair way of making a large fortune. Of course it is not to our interest to deter the public from advertising; but, as guardians of their interest, we think it our incumbent duty to place a lighthouse upon what we consider a dangerous shoal, which may, perhaps, sooner or later prevent shipwreck and ruin to the sanguine and inexperienced about to navigate in such waters. The editor of the "Edinburgh Review," in a number published about three years ago, stated that he considered he was making a desirable bequest to posterity, by handing down to them the amount of talent and ability required by the present class of large advertisers. At that period, —'s mode of advertising was most prominently set forth: and if these remarks, conjointly with his, should descend to a generation to come, it will be known to what extent the subject of this article was able to carry out his views, together with the consequent expenditure in making known the merits of his preparations to nearly the whole world.'

To the foregoing we only add the hope, that a higher consideration of what is due to the feelings of readers will soon induce the publishers of newspapers to exclude all advertisements which, like those of —, are a pollution to their pages.

BEET BREAD.

A discovery has been recently made in Germany—namely, the production of an excellent nutritious bread from beet-root and flour mixed in equal proportions—which is likely to be followed by important results. The present condition of Europe as to food, in consequence of the late potato failures, has drawn the attention of several authorities to the subject; among others, Dr Lindley, who thus delivers his opinion in the 'Gardeners' Chronicle':—'We have had the experiment tried, by rasping down a red beet-root, and mixing with it an equal quantity of flour; and we find that the dough

risers well, bakes well, and forms a loaf very similar to good brown bread in taste and appearance. We regard this as an important discovery, because there is no crop which can be so readily introduced into Irish cultivation as the beet, and its varieties; because no crop will yield a larger return; and because an abundant supply of seed may be had of it from France. We have long since shown the great value of a beet crop in point of nutrition; that, in fact, it ranks higher than any known plant which is cultivable. But there was always the difficulty of how to consume it, for men would find it a poor diet by itself, and the present circumstances of Ireland are not such as to justify the introduction of produce which can become food for man only after having been transformed into pigs and oxen. The discovery, however, in Germany, of the facility with which it may be combined with bread, removes the difficulty, and places beet incontestably at the head of the new articles which should be introduced into Irish husbandry. In its relation to potatoes, beet stands as 1020 to 433, if its nutritive quality is considered; and as 8330 to 3480 in regard to utilisable produce of all kinds. It is still to be determined what kind of beet could be best cultivated for this purpose. Red beet produces brown bread; white sugar beet would probably yield a white bread, and of still better quality; mangold wurzel we have ascertained to form a bread of inferior quality, but still eatable enough. It is suggested, too, that carrots and parsnips might be employed in the same manner as beet. That, too, we have tried, and we find that parsnips are excellent, but carrots much less palatable. All these substances combine readily with flour, but they are rather unwilling to part with their water, and will probably be best in cakes, like oatmeal. This is valuable testimony, to which we may add, that mashed beet and rasped bread, well-dried, and slightly browned, form an admirable substitute for table potatoes.

MYSTERIOUS CANINE INSTINCT.

Mr Justice Williams' death was extremely sudden. He had passed the shooting season with his valued friends, Mr and Lady Augusta Milbanke, at the Yorkshire Moors, a family with which he had long been connected, having sat for some years for a borough of the Duke of Cleveland, her ladyship's father. From thence he went to pass a week with Lord Brougham in Westmoreland. While there, he felt a sharp pain in the chest, but this was only mentioned afterwards, for he never spoke of it to Brougham. On his way through London to his residence in Suffolk he consulted his physicians, who considered it as connected with the liver, and of no grave importance. On his arrival at his seat he was seemingly quite well, and went out daily to shoot. After a week or ten days, he was, on the 14th of September, somewhat indisposed, but had been out riding before breakfast. He did not dine at table, there being some visitors there. Lady Williams left him pretty well in the drawing-room, and returned after dinner, but before the company retired from table. She found him apparently well, and playing with her lap-dog. She went to the dining-room, and came back for the dog in three, or, at the most, four minutes after she had left him well. No sooner did she open the drawing-room door than the animal set up a loud bark, and rushed past her violently, barking and howling all the way. She asked him what ailed the dog, but received no answer. She repeated the question, and seeing him, as she thought, asleep, called his servant to see if his head was not too low. The man said, 'No; he is sleeping comfortably.' She approached him, and again asked him to speak. She observed one eye nearly open, the other half closed, but his colour as usual. The servant and another thought still that he slept, but her ladyship felt sure he was gone. So it proved, for he speedily became cold and pale, nor could any of the remedies that were applied restore him. He had complained, when he awoke just before dinner, that he had in his sleep dreamed of a sword piercing his breast. The examination of the body proved only that all the nobler parts—both head, chest, and abdomen—were in a state of perfect health, except a very slight enlargement of the spleen and liver, of no moment. He never had gout, nor had any of his family. We have entered into this detail on account of the very remarkable circumstance of the dog's instinct. It is quite clear that

the poor animal was aware of the fatal change some time before any observer of our own species could discover that the spirit of its master had passed from this world. Many stories have been told of such an instinctive sense, but it has never before, we believe, been established on such irrefragable evidence as the facts above detailed constitute.—*Law Review*.

NONSENSE.

WRITTEN IN THE ALBUM OF AN UNKNOWN LADY.

I KNOW thee not: my wearied eyes
Ne'er rested in fond hope on thine;
Enchained by no kindred ties,
Thy soul hath never answered mine.

There mingles not one thought of thee
With the deep musings of my breast;
I look not o'er life's stormy sea
For harbour in thy bower of rest.

A vacant pedestal doth stand
In this lone heart—an empty throne:
That seat thou never canst demand,
Thy very name is there unknown.

And yet, as strays my wayward pen
O'er this fair page, a face I see,
A vision flits across my brain—
A shade—a thought—a dream of thee!

I will not ask what name to call
That beauteous image, and far less
Would I dethrone it, even for all
The charms of living loveliness.

Still let us, then, like strangers here,
Unseen, unknown, unknowing be;
And still be thou—most fair, most dear—
A dream, a mystery to me!

L. R.

THE NEEDLE.

How often have I blessed my needle for rescuing me from the temptations which assail the other sex! Bright and innocent little implement, whether plied over tasteful luxuries, or gaining the poor pittance of a day, thou art equally the friend of her whose visions tend to wander amid the regions of higher abstractions, and of her whose thoughts are pinned down to the tread-mill of thy minute progress! Quiet rescuer from clubs and midnight revels, amid the minor blessings of woman's lot, thou shalt not be forgotten! Still come, and let thy fairy wand shine on her; still lend an ambitious joy to the playthings of the girl; still move unconsciously under the glittering smile of the maiden planning thy triumphant results; still beguile the mother whose thought roves to her boy on the distant ocean, or the daughter watching by the sick-bed of one who has heretofore toiled for her; still soothe the long, dreary moments of faithful love; and though a tear sometimes fall on thy shining point, it shall not gather the rust of despair, since employment is thy dower.—*Mrs Gilman's Recollections of a Southern Matron*.

DISLOCATED METAPHOR.

If an individual can break down any of those safeguards which the constitution has so wisely and so cautiously erected, by poisoning the minds of the jury at a time when they are called upon to decide, he will stab the administration of justice in its most vital parts.—*Lord Kenyon*.

VALUE OF THE REFUSE OF TOWNS.

Taking a general view of the subject, we may assume a clear revenue from the sewer water of all towns of one pound for each inhabitant, either in a direct money return, or partly to the inhabitants in a reduced price, from the increased abundance of produce.—*Evidence of J. Smith, Esq. of Deanston, before the Health of Towns' Commission*.

TWO DAYS IN DUNDEE.

THE east coast of Scotland, as is well known, is jagged in a very provoking way with several arms of the sea, which push inconveniently up into the country, and are the pest of that fastidious class of travellers who dislike exchanging their seat in a carriage for the less easy deck of a steamer, to heave and flounder, as it may be, on the surface of those great salt-water lakes. On the northern shore of one of these estuaries stands Dundee, a town many centuries old, but vastly increased in size during recent years; and to this ancient, and now busy hive of population I found myself on my way from Edinburgh, one morning lately, at a very early hour. Fortunately, on this occasion, the two firths to be crossed were in fair voyageable condition; and even had they been otherwise, the drive across the intermediate peninsula of Fife would have been ample compensation.

It was a crisp Monday morning in January. The air was clear and exhilarating; the well-cultured fields were already assuming a greenish hue from the rising crops of winter wheat; and trim barnyards, choked with grain, gave token that there was still, to say the least, nothing like positive scarcity in the land. To these and other rural objects of attraction were added some social features of not less interest. The day was the great annual holiday of this part of Scotland—the first Monday of the year, old style, locally known as 'Auld Handseel Monday.' No working in Fife on Auld Handseel Monday. Coal-miners, ploughmen, domestic servants, and bonnet lairds, of which there are great numbers hereabouts, still hold rigorously by this ancient festival. The roads, accordingly, were thronged with parties bound on expeditions to the houses of relatives and friends; some carrying what I presumed to be small presents, and all dressed in their best attire, orderly, and respectable. Strange to find that, after the lapse of a century since the change in the calendar, a holiday according to the old style of reckoning is still kept over a considerable district of country! There are some things which acts of parliament cannot reach, and Auld Handseel Monday is one of them.

But leaving Fife behind, we must get on to Dundee, which, enveloped in a cloud of smoke, issuing from a crowd of lofty chimneys, did not make itself visible till I was actually landed on its quays. The Dundee folks, however, as I am well informed, care little about the smoke; the great thing with them being plenty of orders for the products of their foundries, spinning-mills, and factories. A sagacious, enterprising set of people, with an indomitable spirit of industry, are the inhabitants of Dundee. I like to see a town take up a branch of manufacture in earnest, and stick to it so pertinaciously as to gain from it a name; and a name

in manufactures is a fortune. It would be a long story to tell how Dundee struggled into a name for its trade in the coarser species of linens; but this name it finally attained; its celebrity and its population increasing with equal rapidity. Some centuries ago, during the old Scottish monarchy, the only ports of any consequence in this quarter of the kingdom were situated along the southern shore of Fife. In progress of time, down most of these sunk almost to annihilation, and out of the wreck of their trade, with a new trade of its own, arose the port of Dundee. Such, some will say, are the strange vicissitudes of commerce; such, I imagine, are the triumphs of energy over indolence. Good luck has always a good foundation. The way the Dundee folks earn their bread is instructive. A fibrous vegetable grows in Pomerania, and other countries adjoining the Baltic. With soil to grow, the people of these regions possess neither the skill nor the capital to fashion the raw vegetable product into the articles for which it is adapted. In this emergency up rise a handful of Scotsmen on the banks of the Tay, who import the fibrous material in great quantities, hackle, spin, twine, weave, bleach, calender it, and lo and behold! half the ships which speck the wide ocean are provided with sails, and half the planter population of America furnished with a clothing suitable to their burning climate! As in the case of the cotton manufacture, there is something interesting in this process of bringing home a rude, and sending away a finished material. In the course of last year, about forty thousand tons of flax, hemp, and kindred substances were imported at Dundee, and pretty nearly eight hundred thousand pieces of cloth of various sorts exported.

I did not visit the banks of the Tay to see manufactories, but the opportunity was too good to be lost; and by the kindness of those on whom I had occasion to throw myself, I obtained an idea of how a bale of flax may be made to assume the character of a web of sail-cloth. What a spectacle of automatic and human industry is exhibited in the extensive mills of Messrs Baxter Brothers and Company. Here everything is done, from the dressing of the flax to the dismission of the cloth. Six magnificent steam-engines give motion to the apparatus of spinning and weaving, arranged in different edifices within a neatly-kept courtyard. Fourteen hundred individuals are employed in the establishment. Formerly, the process of hackling, or cleansing the fibres of the flax, was performed by hand-labour; but a strike of the persons employed in this department has led to the substitution of machinery, which, from its simplicity and efficiency, appeared to be not the least interesting part of the works. By this ingenious apparatus, a few boys and girls, acting as attendants, execute what was at one time the labour of a hundred and fifty men. Another interesting department comprises

the various large apartments full of spinning frames, superintended almost entirely by young girls, who at certain hours, and in relays, attend a school within the premises. But the most curious sight of all is a large apartment, lighted from the roof, containing two hundred and eighty power-looms (the number shortly to be increased to four hundred), the whole superintended by young women, each of whom has two looms under her charge. These power-looms are made of iron, and of considerable strength, having to perform much heavier work than the weaving apparatus in cotton factories. At the time of my visit, the cloth in most of the looms was a stout fabric, of which bags were to be formed for the importation of flour and grain. A glance at the rapid manner in which the looms went through their operations, showed the folly of attempting to compete with them by hand-weaving. Each girl, I was told, can produce, from the two power-looms which she superintends, as much as four hundred yards of cloth weekly, while no man with a hand-loom, according to the ancient process, could turn out in the same space of time more than one hundred and twenty yards. The struggle at competition, therefore, is melancholy and hopeless: it is a vain battle against the united powers of art and nature. Painful, however, as the spectacle may be in reference to the expiring efforts of the hand-loom weavers, we must not allow humanity to blind us to the fact, that by means of the power-loom the material is not only greatly reduced in price, but is produced quickly, and in abundance, when it is required. Perhaps it could be shown that the present dearth might have been somewhat aggravated but for the services of this useful piece of machinery. It was, at all events, pleasing to see the order, propriety, and diligence that prevailed throughout these extensive mills; regulated, as they appeared to be, by that blending of discipline and benevolence which is desirable in the largest as in the smallest establishment.

I was also conducted over one of the principal calendering concerns in Dundee, a sight which should not be omitted by any one desirous of having a thorough idea of the linen manufacture. At the Trades' Lane Calendering Company, cloth is received in a rough state from the factories, and is subjected to a process of smoothing between a series of heavy iron rollers, moved by steam-power. After this, it is cut in pieces of a certain length, and having received the appropriate marks, and been tied up, is then packed into massive square bales for exportation. The packing is effected by means of monster hydraulic machines, communicating an enormous pressure.

The last scene of manufacturing industry to which I was obligingly admitted, was the extensive engineering establishment of Messrs Kinmonds, Hutton, and Steel, where machines of various kinds and locomotive engines were in the course of preparation by a great number of hands. The principal operations, however, were on locomotives, which I saw in every stage of progress, and which it is impossible to get ready with sufficient speed for the demand. A railway between Dundee and Perth, to be opened in the course of the summer, will absorb not a few of these huge, handsome-looking machines, the price of which, I believe, is about £2000 each.

It was a curious transition—like the magic shift in a pantomime—to find myself, in the space of an hour, transferred from the tumult of roaring furnaces and clanging hammers to the perfect repose of a gorgeous apartment in one of the finest mansions in the Carse

of Gowrie—the sun in its declining splendour tinging with glory the distant hills of Fife, and lighting up with its parting rays a foreground of the most beautiful park scenery in Scotland. A day spent at Rosie Priory with Lord Kinnaird formed a charming interlude in my northern excursion; for to all the usual graces of a person in his rank, his lordship adds an earnest desire to be useful in the great cause of social amelioration; and not only so, but possesses the energy to execute what is with too many a matter of mere sentiment or fruitless talk. Of what Lord Kinnaird has done within his own domains, in the way of moral and physical improvement, it would be presumptuous in me to speak. A wider field of operations has engaged his attention in Dundee—a town, with all its industry and intelligence, requiring the services of men disposed to carry out the purposes of an enlightened philanthropy. For many years his lordship has acted as president of the Watt Institution of Dundee. This is an establishment resembling the Athenæum of Manchester, though on a smaller scale, and is named after the illustrious James Watt—a somewhat more rational plan of honouring a great man than that of erecting a pillar, or any other useless piece of masonry, to his memory.* The Watt Institution was now to have its annual festival; and having been invited to attend on the occasion, I went in company with Lord Kinnaird, its president. The meeting, in the form of a *soirée*, enlivened by speakers on matters of moral and social advancement, was felt, I believe, to be a somewhat more than usually happy one: to me at least it afforded all the pleasure which I had been led to anticipate.

My visit to Dundee for the purpose of attending this festive meeting, afforded an opportunity, too good to be lost, for seeing a school for beggar and vagrant children, that had been established little more than a month in the town, and in the success of which I felt some considerable interest. What an object of attraction! But every man has his crotchet, and mine is pretty much to this effect—that prisons and police-offices might almost be brought to the agreeable climax of shutting up shop, if wandering destitute children were captured, and forthwith marched off to school. It may perhaps be recollected that, in November 1845, I gave an account in these pages of a visit to Aberdeen, where juvenile vagrancy and crime had been almost annihilated by the establishment of certain Schools of Industry. The narrative would appear to have created some sensation. Humanity was roused to the importance of schools of this nature; and to the credit of two or three places in England, they made an effort to establish institutions on the Aberdeen model. What, however, has been a very amusing consequence of the article in question, is the great amount of talk it elicited without anything being actually undertaken or done. In Edinburgh, Glasgow, and numberless other populous towns, in which you can scarcely move a dozen yards without being beset by a child in tatters begging for halfpence, and who lives as much by stealing as mendicancy—in such towns, I say, the talk about getting up Schools of Industry has

* In the museum of the institution I was shown a drawing of an arch, proposed to be erected on one of the quays in honour of her Majesty's landing at the spot a year or two ago. Besides being discreditable in point of architectural taste, this piece of masonry, I feel assured, could be productive of nothing but ridicule, on account of its utter uselessness, and also inappropriateness, to the locality; and I would therefore humbly suggest a reconsideration of the subject before any serious expenses are incurred.

been an uninterrupted clatter during the last fifteen months. Men in authority have gone about half-frantic, talking of what they would do in the way of rescuing poor houseless infants from a life of crime and wretchedness. But the misfortune is, they never do it. Not a child is ever rescued; the police calendar is just as heavy as ever. The thing is all a delusion—a monomania. And yet I would not speak too severely of these benevolent projectors. Connected as they usually are with parochial boards, they would appear to possess neither sufficient influence to move such inert bodies, nor the courage to break away and organise schools on an independent footing. In Aberdeen, and also in Dundee, the error of depending on these bodies has fortunately been avoided. No parochial authority has there been consulted. Private benevolence and enterprise have done it all; and with these agents, what may not be anywhere, and on any matter of social concern, accomplished? However unpleasant comparisons may be, it is worthy of observation that, in point of general zeal and benevolence, Dundee, in the present instance, has gone considerably beyond Aberdeen. In the latter town, the institution of Industrial Schools was the work of comparatively few individuals, inspired by the persevering efforts of Sheriff Watson; and the support of the schools has always been a matter of some difficulty. In Dundee, on the other hand, there has been a surprising activity and unanimity in the whole undertaking. Without regard to sect or party, almost every person possessing the means has entered warmly into the enterprise, and subscribed for its support. Already the annual subscriptions amount to £500.

Nowhere have I ever seen so healthy a tone of feeling with respect to Industrial Schools as in Dundee—the practical value of such institutions appealing, as it were, to a class of faculties only found in activity among a manufacturing and commercial population. During my stay in Dundee, I visited the Industrial School twice, in order to see it under different aspects. It is situated at the remote extremity of a somewhat obscure lane, and is entirely what such an establishment ought to be—an old house fitted up in a plain way, with a species of courtyard in front. The building, it seems, was an old warehouse, which has been obtained on lease; and the fittings-up consist of only partitions of rough planks, with a suitable number of forms and tables, and a few kitchen utensils for preparing food in one of the apartments. The directors have been particularly fortunate in procuring a master for the boys and a mistress for the girls from Aberdeen, and under the charge of these superintendents I found the work of the school in full operation. No other classification is observed than the separation of the sexes, at all hours except during meals, when they assemble together. Nor would any finical distinction be of much practical value. The whole are children in rags, destitute, and less or more demoralised by begging, or the commission of petty delinquencies. The greater number were barefooted, and the only appearance of superiority as to dress, consisted of the girls being in uniform checked pinafores, which had been supplied by the benevolence of some ladies. Since the opening of the school, 106 pupils—namely, 65 boys, and 41 girls—had been admitted, and nearly all were present on the occasion of my visits. The spectacle of so many little creatures in such a condition and circumstances caused some depressing, but also some cheering, considerations. What a fate, from no blame of their own, had awaited them from birth! What untold miseries had the bulk of them not endured! Let me run over a few of these statistics of juvenile suffering. One child has no father or mother—a homeless, uncared-for being; 30 have no father; 10 have no mother; 16 have been abandoned by their father; 11 have been abandoned by one or both of their parents; and 38 have both parents in town, but almost without exception of worthless character. With respect to their ages—28 are under seven years, 48 between seven and ten, and 30 from ten to four-

teen years. Among the whole, 32 are natives of Ireland.

Age forms a very insufficient standard whereby to judge of admissibility. It was originally intended to exclude children less than seven years old, but a short experience proved the fallacy of any such arrangement. One pupil, although no more than six years of age, has been twice in Bridewell—in the second instance for housebreaking. An infant burglar—a criminal from the nursery! Looking round the room at these unfortunate beings, quietly picking at pieces of oakum, the schoolmaster whisperingly observed to me, 'You see there before you some of the most notorious beggars and thieves in Dundee. The bulk of them are known to the police, and have been frequently in confinement. Taught nothing good, their minds are in a terrible state of disorder. But we must do what we can for them.' As far as I was able to judge, the appearance of the heads were not particularly bad; but the physiognomies were unequivocally of a mean order. The truth is, these children are for the most part clever and knowing. Thrown, since their emancipation from the cradle, principally on their own resources, their wits have been precociously sharpened in an extraordinary degree. Their task has been to forage for almost every meal—snatched by their hunger at any hour and in any place—to study all possible means of exciting charity, and to contrive petty depredations; and this has formed an education which, though destructive to the moral feelings, has greatly excited the observing faculties. With the whole mind, however, directed to the accomplishment of bad ends, and accustomed to deal with realities, their cleverness does not enable them readily to comprehend ordinary school instructions. They are at that stage of intellectual advancement which apprehends pictorial representation, but not the language which would attempt to rouse impressions of the same kind in the imagination. May we not from this infer that the intellect of these children resembles the condition of mind common among Europeans generally six or eight centuries ago? If such, as I am inclined to think, be the case, a Ragged School forms an interesting subject of contemplation to the student of human character.

Like the Schools of Industry at Aberdeen, the Dundee establishment was primarily and partly composed of begging children swept from the streets by the police; and as vagrant children are still brought hither, a troublesome nuisance is kept down, or stopped as soon as it arises. There has, however, been little need for compulsion. The scholars attend voluntarily, from being presented with the offer of shelter, warmth, and food; and on this account it has been found necessary to exercise extreme caution as to admissions. Some humane persons would advocate indiscriminate charity, and offer an asylum to all the real or assumed pauper children in the country. Nothing in the present state of society could prove more disastrous than such benevolence. Many parents are so depraved, that they would desert their children, or send them out to beg, in order that they might be captured and taken to these pauper nurseries. Cases of this kind are already well known. Some time ago, a family of young children were found in the streets of Edinburgh, deserted by their parents. Without home or friends, they were taken to the House of Refuge, and there, on public charity, kept for twelve months. At length the worthless parents of these hapless beings applied for the restoration of their children; and in doing so, did not scruple to confess that they had secretly waited at a distance to see their family taken possession of by the police. It had suited their fancy to leave the town for a distant part of the country, and they had adopted this mode of travelling unincumbered. A very convenient way this of handing over children to be reared at the public expense! But revelations still more curious await us. There are parents in Dundee who have been known to remove their children from factories in order to make them beggars. It is all a matter of shillings

and pence. An act of parliament was some time ago passed to prevent children under a certain age from attending in factories more than six hours daily, exclusively of three hours for education. Since this came into operation, the wages of such children have been reduced to fifteenpence a-week. The parents of many, believing that more may be realised by begging, remove their children from the mills, and send them out as mendicants. Latterly, a new alternative has presented itself. The Industrial School is known to give three meals a-day; and the question arises, whether this quantity of food, independently of the charge taken of the children, is not of greater value than the fifteenpence weekly received from the mills, or the money picked up by begging. All, I say, is a matter of calculation, and the poor are shrewd calculators. It would be undesirable here to discuss the expediency or justice of a law which prevents parents in humble circumstances from selling the labour of their children for as much as it will bring in the market. I confine myself to what I heard and saw in Dundee, in relation to what it is to be hoped are exceptional cases of depravity. On the day of my first visit to the School of Industry, several children who had been abstracted from factories applied for admittance, but were very properly refused. One girl, however, who had passed through the transition state of mendicancy, I found had, for a special reason, been received some weeks previously. This unfortunate being confessed to me that she had been formerly employed in a spinning-mill; that her mother took her away from that occupation because she got only a shilling a-week,* and had sent her into the streets to beg; from which she was afterwards brought here to school. If there be the slightest truth in these statements, they demand the most earnest consideration, with a view to adopting measures which shall arrest the progress of parental cupidity, and also of the demoralisation which may possibly ensue from legislative interference with labour.†

Much to the credit of all parties concerned, including a committee of ladies, who are indefatigable in their usefulness, the case of every child brought to the school is carefully investigated, and all who appear to be improper objects are rejected. Besides all requisite examinations into family circumstances, the best, if not the only test of admissibility consists in making the school as little attractive as possible. The obligation to labour for three or four hours daily is a penalty which ought to be rigorously exacted. In Dundee, as I have already mentioned, the school is of a suitably unattractive kind; and labour, blended with elementary instruction, is strictly imposed. The preparation of oakum is the work of the boys, and the girls are employed in knitting, sewing, and other feminine duties. The period of attendance is from half-past eight in the morning till eight in the evening: thus the pupils are removed from the streets during the whole day. They

receive a breakfast of oatmeal porridge and treacle, a dinner of barley broth and bread, and a piece of bread before dismissal at night. The fare, though wholesome, would perhaps be rejected by English children; but anything better would be ruinous to the objects of the institution.

Such, then, is the Industrial School of Dundee, which, so far as it has gone, can be spoken of only with commendation. That, under the respectable and careful management it has been so fortunate as to procure, it will realise all reasonable expectations, I have no doubt, and great will be the blessing accordingly. I have only one word to say in concluding this rambling narrative, and that is, to express my gratification at finding so many young men concerned in objects of public usefulness in Dundee. And is this not altogether a favourable trait of our age? In the healthy young mind of Britain, coming more and more prominently into action, we are to look for much that is desirable in the social amelioration of our country. And how much more glorious the career which opens to the young men of the present day, in effecting objects of general improvement, than that which fell to the lot of their predecessors—a generation doomed to spend a lifetime amidst the profitless wranglings of party, and whose minds, untrained to a single exact principle, were little else than a dreary chaos of prejudice and error! Go on, young men, everywhere, in the great crusade now happily commenced against human ignorance, selfishness, and depravity. To your hands—to the hands of men who will work, instead of talking—I commend the consideration of many questions besides the establishment of INDUSTRIAL SCHOOLS. W. C.

LOVE AND FIDELITY.

A TALE.

In the autumn of 1816, a chaise drove up to the gateway of an ancient château, situated near to St André de Cubzac, a village in Gascony, on the road southward to Bourdeaux. The fortunes of this château were remarkable. It had for ages been the residence of the Counts de Marcillac, but at this period it was inhabited by no other human being than an old peasant woman, named Petronille, and her daughter.

Petronille was a singular woman: she had nursed the last Count de Marcillac; and although this was now forty years ago, the lapse of time did not prevent her from still feeling towards her nursing the affection of a mother, notwithstanding she had not seen him since the year 1778, when the Countess de Marcillac quitted the castle with her son to rejoin her husband in Paris. She had remained there until the Revolution. The family was then obliged to fly. The empire had since crumbled away, and then came the restoration; but Petronille had not heard of her masters even once during all this series of years.

Great misery reigned throughout the château de Marcillac. The lands lay uncultivated, and had ceased to bear; the vine-stocks not being renewed, had perished one by one; the walls, already very old, grew dilapidated; the roof fell in, and large gutters were formed in it, so that when it rained, one was scarcely more sheltered within than without. Petronille had, many and many a time, sent letters to the countess, but she never received any answer. Judge, then, the astonishment and joy of the poor old woman when from this postchaise descended the Count de Marcillac and his daughter, now only two years old. When they had entered, the door closed, and the postchaise returned with the horses at full gallop.

That evening all the gossips of St André vied with each other who should have most to say on the subject of the unusual arrival: they were lost in con-

* The practice is to give a shilling weekly, and to pay the accumulated additional threepences at the end of twelve months. If the children are suddenly or capriciously removed, these threepences are forfeited. Unless for this security, there would be no regular attendance.

† In the school a book is kept, in which the particulars of all applications are entered. From this record the following extracts have been handed to me:—

* Dec. 13, 1846.—William B——, thirteen years old, applied. Father dead. Boy was working at Mr Edwards's mill; had left it, being taken away by his mother in summer, because he was on half-time, and has been wandering about the town and country since. He left the work because he got only one shilling weekly. Case refused.

* Dec. 15.—Jessie R——, eleven years old. Applied under the name of Mary Bachelor, daughter of James B——. Lives in Bonnet Hill, Dundee. About a year ago, she was taken by her parents from Messrs Baxters's mill because she was on half-time, earning only one shilling weekly, and was sent into the streets to beg. She pretended to be deaf and dumb, and was taught to act in that manner by her father. Admitted. This is the girl with whom I conversed in the school, and she was described to me as having been a dexterous impostor. She had been induced to speak only after a course of kind treatment.

lectures, especially when they saw not the castle-gate reopen, and Petronille run about the village to purchase supper for her guests. The next morning, therefore, when she made her appearance, she was met by a dozen of her intimates, who had been watching for her.

'Well, neighbour, who is this that comes without ceremony to establish himself at the castle?'

'If he comes without ceremony to establish himself at the castle,' said Petronille, standing erect, and playing with the ribbon which held her scissors to her apron, 'it is probably because he has a right to do so.'

'It is, then, the Count de Marcillæ?' was returned around.

'Just as you say,' replied Petronille, bridling up her chin, and biting her lip.

'He! the count! in a black stock, worn-out coat, and shoes down at the heel! The count, then, returns ruined, my good Petronille?'

'Ruined!' exclaimed the latter, crimsoned with anger and shame; 'he returns no such thing.'

'No such thing!' giggled a neighbour; 'where are, then, his trunks?—where is his baggage?'

'His equipages?' added another.

'His horses, his liveries, his out-riders, as in the time of the late countess?' said an old woman of the quarter, who had known the luxury of the Marcillæs.

'All these will arrive in time,' answered Petronille with downcast eyes.

'Tell us, at least, what child that is which he held by the hand?'

'That is Mademoiselle Amélie de Marcillæ,' replied Petronille proudly.

'And the countess—what of her?'

'We have lost her! But let me alone,' added she, pretending great haste; 'for till the count's people come, there are none but myself and my daughter to wait on him. I have to purchase provisions, and my young lady waits for her milk.' Then elbowing right and left, Petronille bustles past with a look of great importance.

'We can no longer speak to her,' cried the gossips, 'because her count is arrived.' One would think she was become duchess. When the castle is put on its old footing, with its army of valets, its horses, its carriages, there will be no doing with her.'

But a day, two days, a week passed away, and no change took place in the appearance of the castle. But for seeing the count, who was sometimes met alone on foot, and the little girl, whom Petronille proudly took on an airing through the village, one would never have supposed that the owner was returned. When poor Petronille, therefore, or her daughter Marguerite went into the village, there was no end to rallying them, and their pride was put to hard trials. It was but too true their master was ruined. The Count and Countess de Marcillæ had lost everything but this castle in the Revolution, and they had escaped to the United States, where they died. Their son could have repaired his fortune by a rich marriage, but he loved his cousin, a poor emigrant like himself. He married her, but he had the unhappiness to lose her after she had given birth to a daughter, the child in question. In his sorrow, he thought of his country, from which he had been absent so many years; and he was now returned to inhabit the ruined castle, his only remaining possession.

'Petronille, my good nurse,' said he to the country-woman, 'I have just borrowed a rather considerable sum on my property: on this sum I must live and bring up my daughter, the child of my dear Henrietta.'

'Yes, monseigneur,' returned Petronille, for she could not bring herself to call her master monsieur; 'do not be uneasy; we will deprive ourselves of everything for this dear child.'

The count took her hand, pressed it in silence in his own, and Petronille was happy at this mark of familiar affection.

Nor was she undeserving of this attention. Petronille was no ordinary domestic. She was the friend as well

as the servant of the family. Besides keeping up all proper appearances before the villagers, she contrived all sorts of ways and means for procuring a few comforts to her impoverished master and his child. In order to purchase articles of family consumption at a cheap price, she would go long journeys during the night, and with great toil bring home a loaded basket on her head. The count himself never knew of these sacrifices. Petronille did not work for thanks, but for the pleasure of performing what she considered her duty.

Matters went on in this way for six months. At that time the Count de Marcillæ fell ill, and feeling his end approaching, he called Petronille. 'My old nurse,' said he to her, 'I am dying. Listen to me attentively, and remember my words. As soon as I shall be no more, you will take the money which you will find in my secrétaire; you will set out for Paris with my daughter; and you will take her to Madame de Mazans, my poor wife's aunt. This lady has but one son; she is very rich; she will receive my dear little one kindly—at least I hope so.'

'I will do your will, monseigneur,' replied Petronille weeping.

'Go, beg the parish priest to come to me.'

An hour after, the Count de Marcillæ resigned his soul to God, and Amélie was an orphan.

This was a heavy stroke to poor Petronille. She took to her bed of fever; and foreseeing that she would not rise from it, she said to her daughter, 'Marguerite, I am going on high to rejoin monseigneur. When I am dead, you will have me buried as near the Marcillæs as possible; then you will find a purse in that secrétaire; take it—monseigneur gave it to me before he died; you will add to this money that which you will find in the old tinder-jug, and you will set out for Paris with mademoiselle. Here is the address of Madame de Mazans: you will give up to that lady the daughter of monseigneur; and, let Mademoiselle de Marcillæ be able to repay your services or not, you will continue with her. If this cousin should not wish to receive mademoiselle, you will work to support her: it is your duty. I am a Lignac; you also are one; and the Lignacs have always been in the service of the Marcillæs.'

'Very well, mother,' replied Marguerite; 'it shall be done according to your wish.'

In a month after, a young country-girl and a child landed from the boat, which had made the passage from Bourdeaux to Paris in eight days.

The girl having inquired where Madame de Mazans resided, a man who was standing by replied, 'You could not have addressed yourself to any one who could better inform you than myself—I am her house-porter. Madame is just set out for Italy with her son, the Count Armand, who is, it is said, in delicate health. From Italy they will go into Greece—into the East. In fact, they are not expected to return for a long time; as a proof of this, the house is let for a dozen years to a Russian family. I am only come from the coach-office, where I had been to see if the strangers were arrived. And now that you have been informed, I will wish you a good morning,' said the porter, politely taking off his hat, and going away.

The poor girl remained motionless in the street, not knowing what to reply to Amélie, who asked her, 'Where are we going now, Marguerite?'

Marguerite would not have been the daughter of Petronille if she did not know how to extricate herself from a difficulty. The captain of the boat, to whom she now applied, conducted her to the house of a woman whom he knew. She had a small room disengaged, on the ground-floor, and looking into the street. The strangers were installed in it, a modest dinner was served to them, and they were left alone. Having dined, and made Amélie dine, Marguerite put her to bed in the only one there was; she then let down the window, and remained at it, leaning on her elbows, till

day found her asleep. I cannot tell what passed through the country-girl's mind during the night, but as soon as she heard some one stirring in the house in the morning, she went to the hostess.

'Madame,' said she, 'I want the address of a good boarding-school.'

'Good boarding-schools are expensive,' said the woman, casting a glance of contempt on the slender baggage of the travellers.

'We want not money, madame. Name the best, I pray you,' said Marguerite with that air of pride which she derived from her mother.

'In that case I would recommend to you Madame Lartigue's, in the Faubourg du Roule, where are noble and rich young ladies only.'

'Mademoiselle de Marcillæ, whom I attend, is noble and rich,' replied Marguerite. She put on Amélie's best frock and bonnet, asked for a hackney-coach, and desired to be driven to the address named.

'Madame,' said Marguerite to the mistress of the boarding-school, 'I bring you Mademoiselle de Marcillæ. Her father and mother are dead, and her only living relation, Madame de Mazans, is to be absent from France for twelve years; but do not be uneasy as to payment for mademoiselle, I will answer for you for it.'

Madame Lartigue smiled. 'You will answer to me for the payment of Mademoiselle de Marcillæ's schooling,' said she; 'but who will answer for you?'

'Madame,' replied Marguerite with a countenance like scarlet, 'my mother, Petronille, was the count's nurse: his castle is near Bourdeaux.' We had there the confidence of our master.'

'That is well, my good girl; but know, that if I receive mademoiselle into my house, it is from consideration and respect for her misfortunes. After this, if you pay me, so much the better. I am the mother of a family, and I am not forbidden to think of my interest; but if you pay me not, so much the better still—I shall have done a good deed. Therefore, my little Gascon, do not put yourself to the trouble of protestations; and be at ease as to the lot of your young mistress.'

Marguerite was, however, about to make fresh protestations; but the epithet, *little Gascon*, shut her mouth. She paid the first year's schooling, wept much in taking leave of Amélie, and withdrew, irritated at how little was thought of her word.

However, two years passed away without Marguerite's reappearance, and though Madame Lartigue was not uneasy, Amélie was deeply grieved at it. 'If she should be dead—she also!' said the little girl weeping; 'for all that I love, die: papa, Petronille, and mamma, whom I did not know.'

But the last day of this second year Marguerite presented herself in the reception-room, paid to Madame Lartigue the year due, and all other expenses required for Amélie. 'You see, madame, that I am not so much of a Gascon,' said she proudly. She then demanded to see her young mistress; wept with joy at seeing her grown handsome, tall, and stout, and then retired, promising to return before long. Notwithstanding, she returned not till the same day in the following year. She not only brought the money due for the past year, but also another considerable sum, in order that Amélie should have the best masters in music and drawing.

Madame Lartigue now thought she ought to question Marguerite. 'I have made inquiries about M. de Marcillæ, mademoiselle, and I find he has left no property; where, then, do you get this money?'

'This money is obtained by honest means, madame,' replied Marguerite. One need have only seen the firm look with which she accompanied these words, and the calmness of her countenance, to be certain that she told the truth. She then added, stooping her head a little, 'The count, when dying, left to my mother a sum of money to bring up his daughter: that sum is not yet exhausted.' Madame Lartigue had nothing more to say.

Marguerite was seen only once a-year. Each time this question was renewed, and the Gascon—it was thus she was called, because of her accent, which did not become modified by time—still made the same answer, and concealed everything about herself, even to the place of her abode.

Amélie joined her intreaties to those of Madame Lartigue's, but she obtained nothing more.

The day which Marguerite had fixed to bring to Mademoiselle de Marcillæ the money for her schooling, the hour of twelve saw her arrive every year, paler and more fatigued than when last she presented herself, but her eyes were radiant with happiness. In one hand she brought her purse of money, and in the other some presents. As long as Amélie was a child, those presents consisted of playthings, sweetmeats, and cakes; at a later period she brought a frock, a jewel, or some music. Fourteen years passed thus. Amélie had attained her sixteenth year. She was blooming and beautiful; but the peasant girl was become old. As to her costume, it was changed in nothing; it was still the woollen petticoat, showing the small of the legs, in blue stockings, and her little feet, much at their ease, in small-pointed, large, black wooden shoes, called *sabots*; her long waist, and high bonnet of white linen. The secrecy which reigned throughout Marguerite's actions displeased the frank and open disposition of Madame Lartigue, and disquieted the confiding spirit of Amélie. Madame de Mazans, the only one who had a right to demand an explanation from Marguerite, or to refuse her gifts, was still absent; and all that could be done, then, was to wait with patience, till time cleared up the mystery.

In 1833, being the seventeenth anniversary of the entrance of Amélie into Madame Lartigue's school, twelve o'clock struck without Marguerite making her appearance as usual. At first no one was in the least uneasy. 'She will come by and by,' said Amélie; but the day closed, the night succeeded, and Marguerite appeared not. Uneasiness began to gain upon the orphan. 'If any evil should have happened to her!—if she should be dead! Oh, my God! behold me then alone upon the earth!' cried she; and neither the caresses of Madame Lartigue, nor her assurances of friendship, could console her. 'Alas!' said the sorrowing girl, 'I know well that you would do for the poor orphan what Marguerite has done for her, but you cannot speak to me of my father! You did not know him!' At this thought Amélie was inconsolable, and she wept bitterly. She could neither listen to comfort nor receive any, and she began crying out, 'Marguerite!—Marguerite! do not abandon me!'

'Here am I,' said a voice, but so broken, that Amélie did not at first recognise it; but quickly turning round, she found herself in the arms of Marguerite.

The first moment of surprise over, Amélie and Madame Lartigue were about to ask the cause of her absence, especially the cause of the alteration and fright which appeared in her countenance, when the porter announced that a gentleman earnestly intreated to speak with Madame Lartigue. Immediately a man, still young, though not sufficiently so to excuse his impetuosity, precipitated himself into the room, looked round, perceived Madame Lartigue, and suddenly his manners became what might be expected from his appearance—that is, elegant and dignified.

'Madame,' said he, advancing towards Madame Lartigue, and saluting her with all the ease and grace of a man of fashion, 'I pray you to excuse so strange conduct, of which I am about to explain the motive. But first, I beseech you, tell me if you know that person?' He pointed to Marguerite, who, at the sight of the intruder, became visibly disturbed; then all at once she seemed to take a resolute part.

'Sir,' replied Madame Lartigue in a grave tone, 'I would first pray you to inform me to whom I have the honour to speak?'

'My intention is not to conceal my name, madame; permit me, in the first place, to explain the cause of my abrupt entrance. Lately arrived in Paris, I went

yesterday to the French theatre, and coming out by Montpensier Street, where I had ordered my carriage to wait, a voice struck my ear—a clear, harmonious voice, each vibration of which went to the heart. I knew it; I had already heard it at Rome, at Turin, at Florence, at Madrid, at Seville, at Cordova, and I could not mistake it; for it had a Gascon accent, which reminded me of Bourdeaux, my native place. Everywhere I heard it, I made my way through the crowd to come near the singer, and everywhere I found her enveloped in a long brown dress, with her face covered by a black veil: nothing betrayed her age. Judge my astonishment when yesterday I heard the same voice, especially the same accent. I rushed towards the singer—it was still the same figure; and I cried out, "Whoever you are, I will know you!" It drew back, gained one of the numerous passages of the Palais Royal, and disappeared. This evening, going through the Faubourg Saint-Honoré, when I arrived at the Place Beaneau, I saw a little Savoyard; he asked alms of a woman whose dress was such as the inhabitants of Bourdeaux wear; she gave him a silver piece, saying, "Here, poor little thing!" I recognised the voice of my mysterious singer. This woman has entered your house. This is the reason, madame, that I have presented myself in a manner so inconsistent.

'Explain yourself, mademoiselle,' said Madame Lartigue in a severe tone.

'What!' cried Amélie; 'could this singer be you, Marguerite? Oh! it is impossible: it was not you!'

'It was I, mademoiselle,' replied Marguerite with a composed and smiling countenance. 'You remember our voyage to Paris,' continued she. 'The absence of the only relation who could take care of you disturbed me to such a degree, that I could not sleep the first night of our arrival. I was but a child, having a child to bring up—to protect. I had, it is true, a large sum given by your father, but what was that sum in comparison to what was necessary? Not being able to sleep, I opened our little room window, and prayed God to inspire me what to do, when two persons passed. "How much did you get?" inquired a woman. "Three francs," said a man. "And you?" "I have got four; three and four make seven. May Heaven send us so much every day! and we shall be able to rear our children. Ah!" continued she, "where is the time when I got twenty francs for my singing! Alas! my voice is not now clear and sweet, as when we travelled. And in the provinces, in foreign countries especially, when I sang the songs of Paris, white pieces, even yellow ones, were showered upon me." I heard not the rest of the conversation; but one thing I marked, that with a fine voice—and I knew that mine was so—more than usually so—one could get twenty francs a-day. I instantly determined on my course. I paid one year's schooling for you, mademoiselle: I could absent myself one year: I set about learning all the new songs, and I then set out. I was very young to travel in this way. The first time I sang, my youth drew upon me more words than my voice gained sous; but Heaven inspired me with the idea of concealing myself in a long dark coarse dress and black veil; and I had the pleasure to hear it said around me—"That creature must be very ugly to conceal herself thus!" Seventeen years have now passed away. Mother on high! you ought to be content," said the devoted girl, raising her eyes to Heaven. 'I have been able to bring up the child of our master; to pay the mortgage that weighed down his castle. I have had it repaired: the castle de Marcellas is now fit to receive its young mistress!'

'Marcellas!—near Bourdeaux?' quickly demanded the stranger, whose presence Amélie and Madame Lartigue had forgotten during Marguerite's simple and touching recital. This young lady is Mademoiselle de Marcellas? cried he. Then addressing the elder lady, he added—'Madame, will you be so good as to permit me to present my respects to my cousin? I am Armand de Mazans, mademoiselle,' said he to Amélie. 'I will go

for my mother; she will be delighted to find the daughter of her beloved niece, a trace of whom she has been unable to discover, though she has addressed several letters to Bourdeaux.'

As soon as M. de Mazans was gone, Madame Lartigue complimented Marguerite on her generous devotedness; and Amélie threw herself, all in tears, on the neck of the noble girl.

'Become my sister; let the fortune gained by you be shared between us. I owe you everything, Marguerite, even to the family which you have enabled me to find.'

The affectionate caresses of Amélie were interrupted by the arrival of Madame de Mazans and her son.

Our story may now be said to be finished. We have only to add, that Amélie went to reside with her aunt, and was afterwards married to her cousin, the Marquis de Mazans. The faithful Marguerite was now happy. Installed as housekeeper of the old family castle in Gascony, and rejoicing in occasional visits of her mistress, she had nothing in this earth to wish for; her life having afforded one of the most charming instances on record of two things, without which this world would be a desert—LOVE AND FIDELITY.

ANECDOTES OF THE BAR AND THE BENCH.

In a recent number,* we extracted from a single series of papers in the *Law Review* some pleasantries which were probably found amusing. Scattered throughout the whole work, however, so far as it has gone—buried in the profundity of its learning, and entangled in the meshes of its technicalities—there is a fund of anecdote well worth extrication; and for the sake of the general reader, we shall dedicate this article to the task. Some of the anecdotes are little more than amusing; some important; but all, to a greater or less extent, throw light upon legal biography.

The sketch of Mr Scarlett, afterwards Lord Chief-Baron Abinger, is a finished portrait in little. He was, it seems, naturally irritable, but habitually good-tempered; his apparent placidity was drawn over a somewhat sensitive interior; and thus, in conjunction with the keen feelings of a man, he possessed the two great qualifications of a Nisi Prius leader—perfect quickness of perception and decision, and imperturbable self-possession.' At Nisi Prius the leader is like a general, who comes into the field of battle, with a knowledge, it is true, of his numerical strength, but ignorant of the thousand circumstances by which that may be acted upon, and aided by nothing more than a conjecture as to the tactics of the enemy. The difference between the two sides of Westminster Hall is graphically drawn in the Review. 'What was all argument, all talk in Equity, is here all work, all action. What was all preparation and previous plan there, here is all the perception of the moment, the decision at a glance, the plan of the instant, the execution on the spot. The office of the leader here well deserves its name; he is everything; his coadjutors are useful, but they are helps only; they are important, but as tools rather than fellow-workmen; they are often indispensable, but they are altogether subordinate. . . . So far is the advocate at Nisi Prius in the dark as to his own case and witnesses. But of his adversary's, he knows little or nothing; he may have to meet a story of which he had no kind of warning whatever; and he may have to protect his witnesses against evidence called to discredit them, by proving that they have told a different story to others from that which they have told in court. Documents, letters, receipts, acquittances, releases, title-deeds, judgments, fines, recoveries—all may meet him, as well as unexpected witnesses; and on the spot he may have to devise and execute his measures of protection or of defence.' The analogy between a general and a Nisi Prius leader may be carried further; for in both, physical qualities are quite secondary to mental ones. The military

* Journal, No. 165.

commander may be unable to fight well, and the legal one to speak well; but in both, such defects will be atoned for by the capacity to lead. Mr Scarlett, for instance, was far from being a distinguished orator. His delivery was rather free from defects than striking in itself; and perhaps his greatest advantage of this kind was a sweet and pleasing voice—"insomuch that a lady of good sense and of wit once said, that as some people are asked to sing, Mr Scarlett should be asked to speak, so agreeable and harmonious were his tones, though of little compass or variety. . . . The greater feats of oratory he hardly ever tried. He had no deep declamation, no impassioned effusion. He indulged in no stirring appeals either to pity or terror; he used no tropes or figures; he never soared so high as to lose sight of the ground, and so never feared to fall. But he was an admirable speaker; and for all cases, except such as occur once in the course of several years, he was quite as great a speaker as could be desired."

We are now prepared to hear that no man was ever more renowned than Mr Scarlett as a *verdict-getter*. Both his merits and defects appear to have worked towards this point. What he did was without apparent effort. His triumphs were so easy and natural, that they did not seem to be triumphs at all! "A country attorney," says the Review, "perhaps paid him the highest compliment once when he was undervaluing his qualifications, and said—"Really there is nothing in a man getting so many verdicts who always has the luck to be on the right side of the cause." This reminds one of Partridge in "Tom Jones," who thought Garrick was a poor actor, for any one could do all he did—"he was nothing of an actor at all."* His weight with the court and jury was not unhappily expressed by another person, when asked at what he rated Mr Scarlett's value—"A thirteenth jurymen," was the answer."

The following anecdote illustrates in a remarkable manner what has been said about the sensitiveness of the man, concealed under the surface of the lawyer:—"A remarkable instance is remembered in Westminster Hall of his acting in the face of the jury, at the critical moment of their beginning to consider their verdict. He had defended a gentleman of rank and fortune against a charge of an atrocious description. He had performed his part with even more than his accustomed zeal and skill. As soon as the judge had summed up, he tied up his papers deliberately, and with a face smiling and easy, but carefully turned towards the jury, he rose and said, loud enough to be generally heard, that he was engaged to dinner, and in so clear a case there was no occasion for him to wait what must be the certain event. He then retired, deliberately bowing to the court. The prosecuting counsel were astonished at the excess of confidence or of effrontery; nor was it lost upon the jury, who began their deliberation. But one of the juniors having occasion to leave the court, found that all this confidence and fearlessness had never crossed its threshold—for behind the door stood Sir James Scarlett trembling with anxiety, his face the colour of his brief, and awaiting the result of "the clearest case in the world" in breathless suspense."

The following curious anecdote occurs in a notice of Mr Twiss's life of Eldon:—"We have mentioned his wife, and this leads us to the subject of his marriage. He eloped with Miss Surtees from her father's home in Newcastle, she descending from her room by a ladder to join him. They were married in Scotland by a clergyman of the Established Church, who thereby incurred (of which Mr Twiss seems not to be aware) the penalty of ecclesiastical censure, though the marriage was valid, as indeed it would have been had no clergyman at all interfered. The young couple returned

to Morpeth the same day, and finding no room in the inn, were accommodated by the landlord giving them up his own for the bridal chamber. The parents of both parties in a short time forgave this great breach of discipline; but Lord Eldon often appeared afterwards to have it in his eye; and on one occasion, having expressed himself strongly on the impropriety of such an act where a ward of court had been carried off to Gretna Green, he said that it was an offence not to be lightly thought of; on the contrary, one which called for a well-spent after-life to redeem it. The hearers merrily said, "My Lord Chancellor is plainly insinuating a compliment to himself." It is a somewhat singular thing, that at the same time the head of the ecclesiastical establishment, the head of the law, and the great officer of state, next but one to the chancellor, should all have made runaway marriages. When Mr Brougham, in answer to Mr Baron Wood's reprobation of runaway matches in Lolly's case at Lancaster, mentioned that, bad as it might be, the same thing had been done by the Archbishop of Canterbury, the Lord Chancellor, and the Lord Privy Seal, the learned baron said, "I don't believe it!"—and so put it to the jury, observing, however, that it was immaterial to the question of bigamy which they were trying. But he beckoned to the learned counsel while the jury were deliberating, and asked how the fact stood; and upon being told, laughed very heartily, never having heard it before except as regarded the chancellor."

Lord Eldon's habit of doubting, or hesitating, is amusingly illustrated from his own Anecdote Book, in which he is shown utterly to spoil the stories he told *via voce* with admirable effect. They came well from his lips; but in committing them to paper, he had time to qualify them, and they are thus only 'the ghosts, or rather the mummies of their originals.' It was not always on paper, however, that he qualified. "Having said something against a man in a public station, he stopped short with this, "Though far be it from me, my lords, to say anything against any man in any office, for that I know lays me open to hear his panegyric." So, if he ever was betrayed into praise himself, he would hasten to retract it, as it were to set himself right. Once giving the reason for appointing Lord Kenyon Chief-Justice in preference to Mr Justice Buller, he said, "I hesitated long between the corruption of Buller and the intemperance of Kenyon, and decided against Buller. Not, however, that there was not a deal of corruption in Kenyon's intemperance."

The portrait of Mr Baron Garrow is curious. This lawyer was very great in the examination of witnesses, a business of immense importance, as well as difficulty, requiring attributes of a very peculiar order—at the head of which may be placed discretion. From his extensive knowledge, he was at home even in the vocabulary of crime, and sometimes produced by this means a startling effect upon the accused, who little thought that they saw on the bench one who, for the minuteness of his knowledge of their craft, might have been an accomplice. "None who were present will forget the impression thus made upon an unhappy coiner, tried before him on the Oxford circuit. This man conducted his own defence, and did so with much skill and more effrontery. The judge seemed quite absorbed in admiration of the prisoner's ingenuity, and contrived to fill him with the delusion that he was so—a delusion from which there was soon to be a fearful waking. "My lord," he vociferated, "there were only two bad half-crowns found upon me. If I was making a trade of it, it stands to reason I'd have had more;" and he looked up to the bench quite confident of its sympathy. Garrow's white eyes glared upon the culprit, and in a tone which assured him all their secrets were in common, playfully replied, "Perhaps, sir, the *wallop* was exhausted." The word, and the tone of its enunciation, at once unnerved the prisoner; he felt he had before him a professor of his

* "He the best player!" said Partridge with a contemptuous sneer. "Why, I could act as well as he myself. I am sure if I had seen a ghost, I should have looked in the very same manner, and done just as he did."—*Tom Jones*, book xvi. c. 6.

craft, whom it was quite useless to attempt to mystify, and he resigned himself to his fate. "Gentlemen," said Garrow blandly to the jury, who shared in the ignorance of all around them, "a *wallop* is a term of freemasonry amongst coiners. It means the hidden heap of counterfeits to which they resort for a supply when the exigencies of the profession may require one."

An instance of ignorance, quite equal to Garrow's, is given by Mr Warren in his introduction to 'Law Studies.' 'Some two or three years ago, a counsel, manifestly not having enjoyed a very superior education, was engaged in arguing a case in *banco*, at Westminster, before four very able judges, one of them being a man remarkable for his logical acuteness and dexterity. "No, no, that won't do," said he, suddenly interposing; "put the converse of the proposition, Mr —; try it that way." The judge paused; the counsel, too, paused, while a slight expression of uneasiness flitted over his features. He expected the judge to "put the converse" for him; but the judge did not. "Put the converse of the proposition, Mr —, and see if that will hold," repeated the judge with some surprise, and a little peremptoriness in his tone. But it was unpleasantly obvious that Mr — could not "put the converse" of his proposition, nor understand what was meant. Some better-informed brother barrister whispered to him the converse of the proposition; but it was useless. Mr — faltered—repeated a word or two, as if mechanically. "Well!" said the judge, kindly suspecting the true state of the case, "go on with your argument, Mr —." The same writer tells us—'A very eloquent and eminent counsel some time ago gave his hearers the following evidence of his having long ago forgotten his early logical studies. "Gentlemen," said he, vehemently addressing a jury at Westminster, "my learned friend undertook to produce a man who was present; did he? No; on the contrary, he produced a woman." The jury laughed heartily; so did the judge and the bar; but for different reasons.'

Mr Boteler was an admirable man, and a sound lawyer, whose advancement was hindered by the extraordinary defect of 'excessive and insuperable modesty!' He died from the consequences of a railway accident; and we conclude, for the present, with an instance of heroic endurance which has few parallels. 'The first moments of the calamity served strongly to illustrate the kind and considerate nature of Mr Boteler. His attention had been called to the cries and lamentations of a fellow-passenger in the same carriage, and accordingly he directed those who came to his assistance to attend first to his companion, and then mildly observed that he feared his own legs were broken. They were, in truth, smashed to pieces. Not a complaint or murmur escaped him. Horrible as must have been the shock to the system, his calmness and composure never forsook him. It has been mentioned that he very early inquired after his luggage; but it was not added, and indeed could not be known, that he was really inquiring after his papers, some of which were of the utmost importance to his family. Matters comparatively trivial, and which would scarcely have deserved notice if nothing had happened, were not forgotten. Upon his removal to his own house, medical advice was speedily in attendance. The professional men of eminence and experience, to whom for that reason such scenes must have been long familiar, witnessed the patience and fortitude of Mr Boteler with perfect astonishment. It was soon intimated to him that amputation afforded the only chance; and he adopted the alternative without hesitation, and almost without emotion. He had long been attentive to surgical cases, and interested in them, and as the process was going on, he continued to make minute inquiries, step by step, as to the course pursued, apparently as if to procure information—most certainly as if he himself had not been the subject. After the operation he gradually sunk, and the third day brought his sufferings to an end.'

The world generally has very imperfect notions as to the labours of judges and barristers in England—we mean barristers in good practice. The quantity of work which some counsel get through is immense. To be sure it is mostly working by the head; but this is more destructive to health than even labour with the hands. When we hear of counsel being promoted to the bench, or made lord chancellors, we perhaps think they cannot have earned such a reward by anything they have done. In many cases, doubtless, ministerial favour is too often the cause of preference; nevertheless, the greater number of barristers so favoured have been exceedingly hard-working men. What toils, for example, did Brougham, Campbell, Spankie, Wilde go through! The following was the sort of life which one of these men—we shall not say which—led for several years. Rose at half-past four in the morning; carriage at the door at a quarter to five; arrived at his chambers in Lincoln's Inn Fields at five exactly. A fire being previously lighted by an attendant, sat down immediately with clerk to business, and continued working till nine. At nine, attendant brings in two cups of coffee and rolls, on which master and man breakfast, without scarcely moving from their seats. Work goes on till a quarter to ten. Carriage at the door. The barrister now drives off to the courts. Has to attend to perhaps thirty cases. At the courts, pleading, and running about from point to point, till four. Carriage waiting, and back to chambers. Business and orders given to clerk. Dine on a chop. Carriage at the door at a quarter to six. Drive to the House of Commons. Make a speech, and remain in the House till midnight. Carriage at door, and drive home. In bed at one. Up again at half-past four. And so on, five or six nights every week, during terms and the sitting of the House. Such hard work is enough to kill a horse, and how many men sink under it! At the beginning of the season, men of the class we mention look healthy and robust; but towards the conclusion, they are seen to be pale, lank, and feeble. They may be making a fortune, or putting themselves on the high road to the attorney-generalship, or chancellorship, but at what a cost of mental and bodily labour!

People who envy the position of legal dignitaries, do not reflect on, perhaps do not know of, these things. We have heard it said, as a general principle, that no man need expect to attain eminence in the law who cannot exist on three hours' sleep, rise at four in the morning, and kindle his own fire! All the great men of the profession have gone through a due course of these privations.

THE COUNT VAN HORN.

A SKETCH OF BYGONE TIMES.

UNDER the regency of the Duke of Orleans, during the minority of Louis XV., France was in a state of monetary convulsion, only faintly imaged in this country by the late bubble mania, and the panic which succeeded it. In England, the mischief—supposing the amounts at issue to have been the same—was more widely distributed, and therefore less striking in its results. Here, the commercial relationship and intelligence between the capital and the provinces resemble in some sort an instinct animating the whole community. Touch even the most distant extremity, and the vibration is instantaneously communicated to the centre; touch the centre, and the thrill runs throughout the entire country. But in France, in the early part of the last century, this mercantile sensibility had little or no existence. Paris was the seat of the mighty bubble; and the people, instead of ruining themselves quietly at home by means of the post, rushed in frantic crowds to the capital. Thither also repaired adventurers and speculators from all other parts of Europe; the whole world was parched with the sacred thirst of gold; and Paris seemed to the

imaginings of men an inexhaustible fountain, where all might drink and be satisfied. It was the era, in short, of the celebrated Mississippi scheme, by which the country was brought to the brink of ruin through the magnificent errors of a man of genius.

It is now pretty generally supposed, that although the cupidity of the regent may at first have been awakened by Law, the Scottish adventurer was eventually forced onward in his extraordinary career by the regent. The latter, with a fine person, winning manners, quick talents, and the most daring courage, was yet utterly depraved. He did not even believe in virtue. He turned everything respectable or serious into a jest; and he did not enjoy less the society of his dissolute comrades for believing that every one of them would betray him for a consideration. He was, in fact, the Mephistophiles of the great drama then played in France; and despising rather than hating his fellow-actors, he turned their weakness to his advantage, and laughed and joked at their wickedness.

At this time the demon of pride confronted the demon of avarice. Birth jostled with wealth, and it was hard to say which should gain the mastery. Peers and lackeys, princesses and soubrettes, met in the bureau; a duchess kissed the hand of the mighty speculator in public; and the high nobility of France—not without some fits of alarm mingling with their infatuation—saw their order tottering to its fall. Money lightly gained, was lightly spent. Palaces rose on all sides with the rapidity of enchantment; whole fortunes were lavished on furniture and equipages, dress and jewels; and entertainments were habitually given, which seemed to have had their prototypes in the fairy tales. In the meantime strangers from all parts of the world crowded into the fortunate city, increasing its population, we are told, by the number of half a million; overflowing its dwellings from the cellar to the garret, and sending up the price of provisions to an enormous amount.

Among these visitors there was a young man whose adventures were remembered owing to his connexion both with the nobility and the bubble, both with the regent and his comrades, long after Law had disappeared, and Paris was ruined. This was the Count Antoine Joseph Van Horn, a scion of one of the proudest houses in Europe, related or connected with most of the great families of France, and even with the regent himself. The count was a very striking person in his appearance. He was only twenty-two years of age, but tall and finely-formed; his face was as pale and as beautifully chiselled as that of an antique statue; and a pair of singularly wild and brilliant eyes shed over the whole what might have seemed preternatural light. His brother was the reigning Prince of Horn and Overique.

But the young count was not received in Paris with the distinction which might have been expected from his high birth and fine person. This mere youth was already old in adventures, and a blight had fallen upon his reputation. While a captain in the Austrian service he had been guilty of some offence, it is not stated of what kind; but in all probability it was of the nature which he was afterwards so unfortunate as to offer to the regent of France. At anyrate he fell under the displeasure of the commander-in-chief, Prince Louis of Baden; and his brother, perhaps merely to keep him out of the way for a time, exerted his sovereign authority, and sent him as a prisoner to the old castle of Van Wert, in the hereditary dominions of the family. It is believed that the sentence of the prince involved nothing more than a sufficient degree of solitude and restraint to bring the headstrong youth to reflection; but unfortunately the governor, Van Wert, was a man of a morose and savage temper, who added, of his own pleasure, incarceration in a dungeon, and a series of such indignities, as literally goaded the lad into frenzy. At the end of six months' captivity, he effected his escape by knocking down two of his jailors; and finding his way to the family seat of Boussigny, he pre-

sented himself before his brother a raving lunatic. It is a curious trait of the time that Van Wert, when degraded from the command he had so foully abused, made an effort to rouse the peasantry in his favour, and maintain himself in the castle by force; and that he was only restrained by being put under the ban of the empire, when, being seized as a state prisoner, he was locked up in a fortress for life.

The count, in the meantime, was carefully tended, and by degrees recovered his reason. Still, a great and permanent change had taken place in his character. He was subject to uncontrollable bursts of passion, and required a certain degree of management to be kept at all within conventional rule. While his mental malady was gradually yielding to mild treatment, if it may not be said to have entirely disappeared, a circumstance occurred which disturbed the tranquil routine of his life. This was the bequest of a valuable property by his relation the Princess d'Epinay; and the young count having now legitimate business to call him to Paris, determined upon the journey. His brother, however, either fearing that he was not yet sufficiently recovered, or from some other cause not mentioned, was averse to the scheme; and the consequence was, that the youth, unable to bear contradiction, or listen patiently to remonstrance, if any was attempted, set out in secret and alone, and flung himself into the vortex of the capital without even a letter of introduction.

Here his appearance upon the scene excited both curiosity and distrust. Rumours of his early follies, and their extravagant and extraordinary punishment, had preceded him; and here was the scion of a line of princes, handsome, noble-looking, and elegant in manners, wholly unacknowledged by his family, and compelled to introduce himself even to those who felt honoured by being connected with his blood. In these circumstances, his great relatives received him with distinction mingled with reserve. They gave him gay suppers; they took him to the theatres; they initiated him in the thousand extravagances of Paris, at a time when a character of frenzy overspread the revels of the intoxicated city; but their domestic circles were closed against him—their wives were forbidden his acquaintance—and their daughters were warned against those radiant eyes, the ardent gaze of which the ladies, as we are told by a contemporary, declared it to be almost impossible to support.

It is not to be supposed that such restrictions had much effect upon this headstrong and determined youth. People might avoid introducing him to their families, but it was impossible to hide him from their view; and the mystery thus thrown over him added, no doubt, in the female imagination, to the fascination of the tall figure, statue-like face, and wild and melancholy eyes, which were now seen everywhere in the haunts of fashion. The count sought in secret the society from which he was debarred in public, and thus drew upon himself the enmity of some of his most distinguished relatives; and to such a height did this feeling proceed, that a plan is said to have been formed for his being kidnapped and sent off to one of the *El Dorados* of Law. This was no rare occurrence at the time. The gigantic bubble threatened every day to burst; and it was a common practice to sweep the streets throughout France of their vagrant population, and send them off to some of those colonies which were supposed to be unexplored mines of wealth. This forced emigration, it is needless to add, included frequently the victims of secret vengeance; and many a gay gallant, on awakening from a dream of either allegorical or literal intoxication, found himself dancing upon the billows of the Atlantic.

Count Antoine was under the greater risk, from the circumstance of his being in the habit, like other wild young men of the time, of traversing the streets at night in disguise; and on one occasion he actually fell into the hands of a party of crimps, who were apparently lying in wait for him. Having escaped with some difficulty, he mentioned the affair to his relation

the Marquis de Crequi, and the marquis laid a formal complaint before the minister. This well-meaning friend, however, received no satisfaction. It was hinted to him that he would do well not to interfere, but let things take their course. 'Let the count quit Paris immediately,' said some mystic adviser; 'if he lingers, he is lost!' It is supposed that the revengeful feelings of any mere private person are not sufficient to account for such warnings in the case of a person so distinguished in rank as the brother of the Prince Van Horn; and an anecdote is related which would seem to show that he had drawn down upon himself the enmity of the regent himself.

A man of the world like the regent should not have given himself the trouble to lay schemes for the destruction of his enemy; he might have been assured that a desperado like the count would not be long in Paris before plunging headlong into difficulties that would lay him at his mercy. Some instinctive fear, indeed, appears at this time to have spread among the youth's friends: the mysterious warnings were repeated from one to another; all but the mad companions of his follies wished him safely out of the whirl of the capital; and at length the Prince Van Horn taking the alarm, despatched a gentleman of his household to Paris, to pay his losses at play and other debts, and endeavour to persuade him to return to Flanders. In the event of his refusal, the gentleman was instructed to apply for an order from the regent to compel him to quit the capital.

When the messenger reached Paris, he found the city in a state of strange excitement on account of a murder which had been committed the day before. The occurrence would at that time have given the French capital what it is so fond of—a 'sensation'—if for nothing else than that it was connected with the great bubble; but in addition to this, the victim was a wealthy Jew, and the perpetrators persons of rank. The Jew, it seems, who was a stockbroker, dealing extensively in the shares that were to make the fortune of all the world, had met three of his clients in a tavern by appointment, with one hundred thousand crowns in his pocket. Cries were heard from the room in which their business was transacted, and the waiter, apprehensive that some crime had been committed, locked the door. One of the three clients, who was on the stairs, immediately fled, and gaining his hotel, collected all his portable effects and left the country. A second leaped from the window of the room, and ran for some distance along the streets, till he was seized by the pursuers; while the third had stumbled when he reached the ground, and was immediately taken. This last was the young Count Antoine Van Horn.

Various versions of the story were of course circulated in Paris. The count asserted that, so far from aiding in the murder, he had attempted to save the victim's life, and only left the room through instinctive fear and horror, when he found himself alone with the dead body. But, on the other hand, De Mille, the other prisoner, confessed to a plot to rob and murder the Jew, implicating the count in the crime; while it was obvious, from the flight of the third person, that he at least was cognisant of some evil intention on the part of one or both of his companions. All three were wild young men—one of them only twenty years of age—living at the same hotel, and passing their time together in gambling and other profligacy. It may be noted that Count Antoine, while he indignantly and energetically denied the murder, was wholly silent as to the charge of intended robbery. He vouchsafed no reply to such an accusation; treating with cold disdain the idea that he, one of the noblest-born men in Europe, could be guilty of so pitiful a crime.

A meeting of the relatives and connexions of the House of Van Horn took place at the hotel of the Marquis de Crequi; and in order to enable them to avert the threatened disgrace, an investigation was entered into resembling what is called in Scottish law a precognition.

They could learn nothing, however, beyond what has already been told; and the conclusion they came to was, that, whether guilty or innocent, the count stood in so critical a position, as to require the whole influence of his family. They applied, accordingly, to the regent; adverting to the mental malady under which the young man had laboured so recently; suggesting that if a squabble had taken place in which blows were struck, the affair was in all probability unpremeditated, and at anyrate the guilty hand uncertain; and intreating him to interpose his power to prevent the exposure of a public trial. The duke was inexorable. Justice must take its course.

The relatives of the accused now adopted a plan which throws a curious light upon the feelings and manners of the time. On the day of trial, they assembled at the Palace of Justice in a body of fifty-seven, both male and female, and lined the long corridor which led to the court-room. As the judges passed through this proud array, they were saluted in a mournful and supplicatory manner by the highest and noblest of Europe, and passed into the hall of trial with their minds strongly impressed, even if their hearts were not melted, by the imposing scene. But all was of no avail. The two prisoners were found guilty, and condemned to be broken alive on the wheel.

Immediately on this result taking place, the high nobility connected with the House of Van Horn went into mourning. Another meeting was held, and a petition got up for a commutation of the punishment to perpetual imprisonment. The grounds could no longer be the probability of the innocence of the condemned, for this would have been disrespectful to the judges; but his terrible sufferings in the dungeon of Van Wert, the insanity which supervened, and the morbid irritability under which he still laboured, were brought forward as palliatives of an acknowledged crime. The petition was signed by cardinals, archbishops, dukes, marquises, and ladies of the highest rank, to the number of fifty; and numerous other names were refused a place—as not being noble enough for such association! To sign this aristocratic paper was an honour for the noblest, for it established their claims to a share in the best blood of the kingdom. The Marquis de Crequi was afraid to incur the responsibility of determining on some of the claims, and he called in to his assistance the Prince de Ligne; but, notwithstanding, the heart-burnings and jealousies to which the affair gave rise threw the great world of Paris into a general uproar, and fifty years afterwards complaints were still made by some parties of the injustice with which their ancestors had been treated!

The petition was presented by a deputation, consisting of the Cardinal de Rohan, the Duke de Havré, the Prince de Ligne, and the Marquis de Crequi, the rest of the body remaining in the hall of council in the Palais Royal, the residence of the regent. After a long period of suspense, passed in the most gloomy forebodings, the latter beheld with dismay two of their delegates returning into the hall in moody silence. They at length related that the regent continued inexorable. 'We reminded him,' said they, 'that so infamous a punishment would not reach only the condemned, but also those princely and illustrious families in whose armorial bearings were quarterings of the dishonoured name: to which he replied that the dishonour consisted in the crime, not in the punishment. And when we urged, as a last argument, that in the thirty-two quarterings of his own mother there was an escutcheon of Van Horn, he but said, with his sardonic smile, "Very well, gentlemen, I will share the disgrace with you!" The noble petitioners, however, remained till midnight, awaiting the return of the other two delegates; and at length, on the cabinet conference being at an end, the regent himself came forth, and dismissed his visitors with his usual politeness. One of the old ladies he kissed on the cheek, calling her his good aunt, and to another, a younger one, he told, in Mephistophiles

fashion, that he was charmed to see her at the Palais Royal. All the ladies he conducted in person to the door of the second saloon.

The petition, however, had been successful to a certain point: the count was to be beheaded, not broken on the wheel. This the regent solemnly promised. But it was not enough for the pride of some of the family, two members of whom visited the condemned secretly, offering him a vial of poison, as a means of escaping the disgrace of a public execution. Count Antoine refused the favour; and his relations left him, exclaiming indignantly, 'Miserable man, you are only fit to perish by the hand of the executioner!'

The influence of the family was now tried upon the executioner, who was besought, in cutting off the head, to expose no part of the body to the gaze of the rabble but the neck. The executioner promised this; but, with the pride of a headsman of the old régime, declined two sums of a hundred louis each, which were offered him as a bribe. The regent's orders, however, had not yet come, and the sentence stood in its original form; but the relations—who were still probably in some dismay at this strange display of inexorable feeling—were reassured by a letter from a familiar friend of the duke, repeating his promise that the punishment should be decapitation. The day, however, at length came, and the proud family of the criminal, buried in their aristocratic homes, shrinking and quivering at the idea of the disgrace they were at the moment suffering by the public execution of their kinsman, learned that the regent had *deceived them*—that the young, handsome, and high-born Count Van Horn had that morning been tortured, and then exposed and broken alive on the wheel!

The indignation of the relatives may be conceived. They went in a body to the place of execution, with carriages drawn by six horses, and surrounded by lackeys in magnificent livery; and then, with their own hands, detaching the mutilated remains from the wheel, carried them away in state. The regent was held in hate and horror by the nobility for the rest of his life, although no open scheme of vengeance was ever adopted; and the Prince Van Horn, in a letter rejecting indignantly the confiscated effects of the count, that were adjudged to him, added these words: 'I hope that God and the king may render to you as strict justice as you have rendered to my unfortunate brother!'

REMARKABLE ELECTRIC AGENCIES.

In a former number of the Journal, we drew attention to the investigations by Professor Matteucci, of Pisa, on the above highly interesting subject. This gentleman, at the late meeting of the British Association at Southampton, communicated the results of his additional observations and experience, of which we propose to give a brief outline. The principal points established by renewed inquiry appear to be the non-existence of electric currents in the nerves, their complete identification with the muscular system, and their development as an essential consequence of the chemical process of nutrition.

'The chemical action,' says Professor Matteucci, 'which goes on in the nutrition of the muscle, principally that which takes place in the contact of the arterial blood with the muscular fibre, is in all probability the source of this electricity in the muscles. . . . It appears more satisfactory to say that the development of electricity takes place in the muscle during life, from the chemical action between the arterial blood and the muscular fibre; that the two electric states evoked in the muscle neutralise each other, at the same points from which they are evolved, in the natural conditions of the muscle; and that, in the muscular pile imagined by myself, a portion of this electricity is put in circulation just as it would be in a pile composed of acid and alkali, separated from each other by a simply conducting body.'

All voluntary muscle is covered by a tunic, or mem-

branaceous sheath of great delicacy, known to physiologists as the *sarcolemma*. This, it has been supposed, affords a mechanical protection to, and isolates the contractile tissue within it, while its extreme smoothness facilitates motion and the rapid transmission of moving influences. It is important to remember that the *sarcolemma* terminates abruptly where the muscular fibres connect themselves with the fibrous substance of the tendons, as Matteucci refers to this arrangement in support of his hypothesis. Instituting comparisons between the muscular current and the proper or nervous current, he inclines to consider them referrible to a common origin, and subject to the same laws. Looking at the tendinous fibre, distinct in its structure and conductivity to the muscular, he regards the proper current from the former to the surface of the latter as 'at once the simplest and most general cause of the muscular current. We must never forget the analogy between the muscular electro-motor element and the Voltanian element: the zinc is represented by the discs of the muscular fibre, the acid liquid by the blood, the platinum by the *sarcolemma*.'

The contraction of the muscles has also engaged the attention of Signor Matteucci. It is already known that when muscular fibre is examined with a powerful microscope, it is found to consist of innumerable oblong cells, which cells, as the muscle contracts, diminish in length, and increase in width. Sir John Herschel suggested to the assembled physiologists that muscular fibre consists of spheroids, which, when at rest, lie with their larger dimensions lengthwise; but on the excitation of electricity by the will or otherwise, their poles becoming reversed, the spheroids swell out in the opposite direction, thereby shortening and widening the muscle. According to Dr Martin Barry, muscular fibre is composed of an infinite series of spirals, a form admitting of the most rapid elongation and contraction. Whichever it may be, the Italian professor remarks that as yet he has no proofs of the contraction arising from the evolution of electricity. 'We know nothing,' he continues, 'of this phenomena, except that it occurs on acting at a great distance from the muscle upon the nerve that ramifies within it; . . . that its propagation acts with a velocity which we cannot judge to be less than that of light and heat* and electricity in their different media.' Among the phenomena of this muscular action, or *induction*, may be included 'a great number of those movements which occur in us and in animals independently of the will, but yet following others occasioned by the will.' The clearing up of these points remains to animate the genius, and reward the perseverance, of physiologists.

Identical with this subject, and strikingly confirmatory of Signor Matteucci's conclusions, is a remarkable and interesting paper read at the same meeting by Dr Bullar, on the 'Identity of certain Vital and Electro-Magnetic Laws.' According to this gentleman, a power exists in animated beings, influencing the formation of vessels, the action of the blood and its circulation, independent of the power of the heart. He adduces in support of his theory the progressive developments, long familiar to naturalists, that take place in the yolks of eggs during the process of incubation. On examining the contents of a sound egg, a small white disc, the *cicatricula*, or germ spot, may be seen in the yolk. This has been shown to consist of an aggregation of nucleated cells, concealing within them the parent cell, or central point of the action called into play by the warmth of the parent bird. The disc gradually enlarges its dimensions, and by the same process that contributes to the increase of all animal fibre, by forming cell after cell; retaining, however, its primitive form. The growth goes on, and at the end of the eighth hour, whitish circular furrows are visible, commonly termed *halos*. The deposition of cells, for which the yolk furnishes the material, becomes continuous; they range

* Light and electricity travel at the rate of 192,000 miles in a second of time.

themselves on the substance of the disc in concentric layers, showing, even at this early stage of their development, the existence of a law of motion operating in a circular direction. This motion Dr Bullar considers to be identical with that created by electro-magnetism.

The next process is that by which these cells are formed into blood, and vessels for its transmission. Faint streaks appear radiating directly from the first centre, uniting at a sharp curve, which afterwards becomes the heart of the animal, and forming eventually a complete circle by the junction of the capillaries at the circumference. In these radii we have evidence of another force, whose direction is at right angles to that by which the deposition of cells in concentric circles had been accomplished. The radiating vessels also appropriate new matter from the yolk, and present in their development a variety of forms, a network of cylindrical and circular channels, yellowish in colour, and all tending to the central germ. An undulatory motion, which has been for some time visible in the substance immediately surrounding the disc, now changes its character, pulsates, and drives the blood in scarcely perceptible red streaks through the larger vessels. Around these vessels, which at first are transparent, there is a continued deposition of cells, in such a manner, as to lead to the inference that the motion of the blood in one direction produces another motion at right angles to its course, at the same time forming the tubes through which it flows.

Whatever may be thought of these theoretical views, they are in exact conformity with the laws of electro-magnetic action. It has been established by Professor Faraday, that 'when a current is first formed, it tends to produce a current in the contrary direction in all the matter around it; and if that matter have conducting properties, and be fitly circumstanced, such a current is produced.' In the case of the egg of the bird, or the ovum of the mammal, there is no failing of essential circumstances; the material of growth and warmth are abundantly supplied. If iron filings be placed in contact with an electric wire, they immediately range themselves round it in concentric rings. If placed on a sheet of pasteboard over a magnet, they assume the form of regular curves, diverging from each pole, and meeting in the centre. Again, if a flat spiral coil of wire magnetised be laid on iron filings, they take a position in lines through its axis, and bending over at the extremities, form a continuous circumference, as instanced in the radii from the disc of the egg to the circle of capillaries. It should not be forgotten that there is a marked difference between the galvanic and magnetic currents: while the former passes directly along a wire, the latter revolves round it—one is direct, the other rotary.

The spiral coil of galvanic power may thus be taken to represent the disc containing the embryo, while the arrangement of the radii and capillaries represents the disposition of the iron filings in obedience to the magnetic force. Hence Dr Bullar concludes, that, whether physiological or chemical, the forces are in both cases the same: the galvanic force circulating in the disc once admitted, the magnetic force operating in the direction of the radii of vessels is necessarily involved. And although the actual movements are invisible in the living substance, there is little difficulty in believing them to be such as described, when we see their progressive development in obedience to this law.

The truth of the hypothesis is further strengthened by Seebeck's experiments: he showed that the circulation through a coil of a current of heat, instead of galvanism, was equally productive of radiating magnetic currents. In this case the analogy is still more striking: heat is the motive power in both operations; both possess dispositions for the distribution of the forces, and are always at right angles with the other. A still more striking analogy is found in the results attendant on the use of a hollow spiral or helix. The galvanic force passing along the wire creates a current within the

coil; if placed under water, a needle floated on cork would be carried through it; and when brought into contact with iron filings, they arrange themselves in a circle, one segment of which passes through the helix.

The analogy between the vital and chemical actions is thus made out: the formation of blood, with its circulation and development of tubular channels, are coincident, indicating a direct and a circular motion, the latter, with the materials at its disposal, constructing the tube. The veins in the body, as is well known, form a complete circuit, departing from the heart, and reuniting in the capillaries at the extremities—in which arrangement we find a compliance with one of the essential conditions. The cells, constituting the form in which power is first developed, become red globules by the influence of oxygen, and show, by flowing in one direction, that they are acted on by the vital force; and at the same time the arrangement of other small transparent cells round the moving current sufficiently proves the existence of a direct as well as of a circular movement.

It is a well-established fact, both in vegetable and animal physiology, that the first indication of organisation is a cell, possessing a central energy, with the power of appropriating and arranging other cells, which in turn become new centres of power, and extend the assimilating process. Coral, and many other geological formations, consist of cells: the integrity of the epidermis is maintained by a continual growth of cells. 'Discoid corpuscles,' says Martin Barry, 'circulate in plants; and spirals appear to be as universal as fibrous structure.' In plants, as in animals, these corpuscles become coils, and eventually spirals. His examination of blood-vessels showed them to be formed with an inner structure of longitudinal filaments, surrounded externally by other spiral filaments. 'Not only,' he continues, 'does every tissue seem to arise out of discs having all the same appearance, but the primary arrangement and early metamorphoses of these discs seem to be the same. We recognise the same combination of spiral threads in the mould of cheese as in the brain of man. How wonderful the fact, that out of materials so similar, structures should be found endowed with properties so different!'

The same law seems thus to pervade all the vital operations of nature: the explanation, however, to be chiefly looked for, is of the mysteries of the animal economy. How much takes place in the system that cannot be accounted for by the mere action of the heart! What a field for investigation—investigation according to the rigorous principles of philosophy—remains to be cultivated by the diligent student. As an important step in advance, we hail the discoveries of the learned Matteucci; they cannot but stimulate British physiologists.

RECOLLECTIONS OF LONDON LODGINGS.

No one who has not tried it, can have any idea of the difficulty of procuring lodgings in London of a respectable and comfortable kind; and if to these qualities we add that of moderate charges, the difficulty is tenfold increased. Lodgings are plentiful, though much more so in some districts than others; but those who keep them may be said to be all pretty much of one genus—people in struggling circumstances, who try to make both ends meet by letting their apartments to strangers. Some may be said to make a business of it; but, on the whole, few let lodgings who can command a better means of livelihood.

It has not been without pain that I have remarked a tendency in popular literature to throw ridicule on the letters of lodgings. In some instances, no doubt, they expose themselves to reproof and sarcasm by their attempts to overreach or deceive customers. But reflect for a moment on the manner in which they are too

often treated. They can never guard altogether against imposition. Persons of the fairest appearance, and with what may seem good references, frequently turn out to be of infamous character. Among those even who are in all ordinary respects unobjectionable, how many are reckless as to the trouble they give, or the destruction of furniture and other articles of which they have the use. It is a matter of droll comment, that as you ascend from storey to storey, the accommodations are progressively shabby. On the first floor, which commands perhaps a couple of guineas a-week, things are pretty decent and entire. On the second, there is an evident falling-off: the carpets are threadbare, chairs are not well-matched, the china is cracked, and the candlesticks have long since lost all pretensions to plating. On ascending to the third floor, things are seen to wear a much more disconsolate aspect: the carpets are now in holes, certain chairs have broken backs, jugs have lost their handles, and the teapot is minus a part of its spout. Now, of all this not a little fun may be made. But are the persons, generally speaking, who take these lodgings, deserving of anything better? It is not the letters of the lodgings who break the backs of chairs, kick holes in the carpets, crack glasses, and knock off the spouts of teapots. It is lodgers themselves who play all these merry pranks. I remember once occupying the second floor of a lodging in London, and was robbed of all comfort by the exploits of a German who lived on the floor beneath. This monster, who was some way connected with one of the theatres, never came home till about one in the morning; and all the way up stairs, and till he went to bed, he amused himself with singing an unintelligible German song. At seven he awoke, and commenced smoking in bed, the fumes from his odious pipe ascending through the whole house. Having thus indulged himself for an hour or two, he rose, and, by way of prelude to breakfast, played an air on a bassoon, or some such atrocious instrument. After this, till he sallied out, towards the afternoon, the whole house was kept in a state of distraction with the noises which he and his visitors unscrupulously made. So great was the nuisance, that I at length removed to another establishment.

Such is a sample of the annoyances to which lodging-house keepers are constantly exposed; and the repetition of these things tends unquestionably to harden their feelings, and indispose them to take any great pains to make their lodgers comfortable. During a residence of several years in London lodgings, I have had occasion to mark the many privations to which their keepers subject themselves for the sake of a livelihood. For one thing, how surprising their capacity for enduring confinement and want of fresh air. Those who live long in town do not notice this, but it seldom fails to be remarked by strangers. I shall never forget how very forcibly I was made acquainted with this capacity when I went in search of apartments in the respectable but not stylish region which lies between Queen Square and Grey's Inn. The mode of living in lodgings was to me quite a novelty. I had left behind me the comforts and conveniences of a home; added to which, I had never been accustomed to live in a town, but had breathed the comparatively pure air of the suburb of a provincial city. The street which I selected was one of that sort never seen except in London—rather narrow, but clean and quiet. The houses were uniform, and very high. They could scarcely be said to look like private dwelling-houses, yet their appearance was respectable, though not inviting. They seemed exactly the sort of houses that a large and respectable family would not select, so closely were they packed together, and so uninviting was their external aspect. Notices in various windows informed the passer-by that 'furnished apartments' were to be had. After a good deal of inspection, I obtained two rooms on a first floor, and shortly afterwards removed my carpet-bag and

small trunk to my lodgings. When I had been settled for a few days, I had leisure to look round on my position, and see what sort of a place my new domicile was. The house in which I lodged consisted of four storeys, and I soon perceived that the portion occupied by the owners was a very insignificant portion indeed. The proprietors were a man and his wife. I mention the wife particularly, because she appeared to all intents and purposes as the sole owner. They had a family of three children. The man was engaged in business during the day, so that he did get a little out-door exercise; but the wife and the children seemed fixtures of the establishment. They reserved to themselves a single room, which was an under-kitchen, and this apartment fulfilled the end of kitchen, wash-house, sitting-room, and drawing-room. Their capacity to live without air seemed to me most wonderful. They appeared to consider themselves as strictly nobody, or rather in the light of second-rate pieces of furniture, to be stowed in the least possible space. As for going out, the mistress never dreamt of such a luxury. The consumption of shoes and bonnets was next to nothing. They never visited any friends, and never invited any. If you talked, as I sometimes did, about the pleasures of the country, and the beauty of green fields, the idea of such things seemed almost unknown, or, if ever known, they seemed entirely to have forgotten it. They were born in London, they had lived all their lives in London, and they scarcely seemed capable of forming a conception of any world beyond its suburbs. I believe this to be a most faithful sketch of a very numerous and singular class, which is to be met with in no other place but the metropolis.

I could not help putting to myself the question, while I was the inmate of this domicile, whether these people were happy, and whether it was the sort of life which befits the dignity and capacity of such a creature as man? It seemed to me, who had been accustomed to society, that this mode of existence was scarcely to be called living, but rather vegetating. Their information was positively nothing, except about the streets in their immediate vicinity. As for reading or meditation, there seemed to be no opportunity for either. There was not poverty, but there seemed to be all the inconveniences arising from it. The children in such a family were objects of great pity: too far from the parks to enjoy themselves there, and too well brought up to play in the streets, they were necessarily confined to the house. I learned many excellent lessons during my lodger-life; and, among others, I learned how thankful ought they to be who had the blessing of a garden behind the house—a thing often slighted, but which no one can fully appreciate until he pays a visit to London in the capacity of a lodger.

In some lodgings which it has been my fate to inhabit, the master and mistress of the establishment were of a superior class, so far as going out is concerned. They could indulge in a walk on Sunday, or occasionally attend the theatre; and I have sometimes been surprised at the quantity of knowledge which such persons possess of the opera, which they look upon as a kind of earthly paradise, and which they imagine all the world ought to be very much delighted with. I believe I have frequently lost all character for taste, in London, by saying I did not care for the opera. But this is wandering from the subject. I was speaking of lodging-house keepers who can indulge in an outing (a London word), and these consequently must have some factotum in the shape of a servant-of-all-work, to whom the mistress can resign the charge of the domicile. We hear a great deal about slaves and the horrors of slavery, and women working in coal-pits, and children working in factories, but it is my conscientious conviction that nobody deserves more pity than the servant-of-all-work in a lodging-house. Up early, and down late, on her feet all day long, answering the door, attending to bells, cooking and slaving in the kitchen, carrying up coals to the apartments, sweeping stairs—ordered, worried by every-

body. What a life the poor wretch leads; and what she complains of most, never an instant to clean herself! She is about as dirty as a sweep. Even on Sundays, she has but a faint remission from duty. By way of an immense favour, she is allowed to go to evening service once a fortnight. The soul of a maid-of-all-work is, I suppose, thought to be very little worth. Dear, kind-hearted legislators, do not lavish all your compassion on factory workers. Spare a little for domestic servants. Do pass a law that they shall not labour more than the moderate quantity of eighteen hours out of the four-and-twenty!

It has been remarked, that the greatest solitude in the world is to be alone in London. A young man becomes painfully aware of this truth when he is settled in one of the abodes I have above described. The family circle, the agreeable chit-chat, the sisterly or maternal affection, the thousand comforts of home, are sadly missed. If there is one thing more than another the want of which is painfully felt, it is the charm of female society. After being engaged in business, or, which is very often the case, the *pursuit* of business, the whole day, to return to one's lonely lodgings with no friend to greet, no company to cheer, is what renders even a sojourn in London so distasteful and almost insupportable to country visitants. The lodger sits in his apartment in the midst of the huge city, whose whole extent, with its millions of human beings, contains no friend, perhaps no acquaintance. The occasional knock at the door announces no friendly visitor. Perhaps the occupant of the second floor, who, after labouring in the uninviting toils of a salaried law-clerk during the day, returns to his wife and three children, who have seen no familiar face since his departure; or perhaps a fellow-adventurer is retiring to his single apartment on the top floor, which serves both as a sitting and bedroom.

If a young man has not means sufficient to support frequent attendance at the theatres, and other places of amusement; if he is compelled to live frugally, and has no friends or acquaintances to whom he may occasionally resort, a life in London requires no slight self-dependence, no small self-sufficiency, to yield anything like pleasure or satisfaction. The property of 'home-sickness' becomes very strongly developed; and nothing short of a stern necessity, or an indomitable perseverance, can sustain the wanderer from the domestic hearth. It is a common remark, that *friends* are much more scarce than *acquaintances*; and at no time is the truth of this observation more strikingly apparent than during a pilgrimage in the metropolis. And yet, with all these drawbacks; notwithstanding the vast and thronged solitude, the absence of friends, and of fresh air; notwithstanding the narrow street, the close room, the dingy curtains, and the solitary meal—there is yet a pleasure, great and supporting, in the pursuit of a worthy object amid such sources of discouragement and depression. There is a satisfaction in overcoming difficulties, and in battling with opposing circumstances, which the pleasure-seeker never knows; and the diligent frequenter of theatres, the visitor in crowded halls, and the attendant on the marts of fashion, has never felt, and is incapable of feeling, the proud self-gratulation which arises in the breast of the youth struggling in the solitude of London—battling to overcome difficulties, and buoyed up with the hope of being ultimately successful.

It is pleasing to know that the condition of young men in lodgings in London is beginning to be meliorated by various movements in the social world. A cheap and improving kind of literature offers its solacements; associations of the club-house character, or at least offering the advantages of a library and lectures, have been established in different quarters of the metropolis; and for strangers falling into sickness, that useful establishment, the Sanatorium, offers a friendly asylum on moderate terms, and thus is illness robbed of one of its most distressing features.

BOOK-BORROWING.

WHEN we were at school, it was customary for the boys to write on the fly-leaf of all their books, especially their more attractive ones, these verses, intended as a sort of 'take notice' for the careless and the furtive borrower:—

'If thou art borrowed by a friend,
Right welcome shall he be
To read, to study, not to lend,
But to return to me.

Not that imparted knowledge doth
Diminish learning's store,
But books, I find, if often lent,
Return to me no more.

Read slowly, pause frequently, think seriously,
Keep cleanly, return duly,
With the corners of the leaves not turned down.'

In the three first lines of these familiar verses, the owner very generously offers to lend the book to any friend who simply wants to read and study it. This praiseworthy liberality is quite in the spirit of that of the celebrated book-collector Grollier, who had his splendid volumes inscribed with the words, *Jo. Grollierii et amicorum*, implying that they were intended for the use of his friends as well as himself. There is something selfish in refusing to lend a book, provided it is not a very rare or costly one. The selfish book-owner should be reminded of the anecdote of the poor student at college, who sent a note to one of the professors to ask the loan of a book. The professor's reply was, that he never lent books to any one, but that the student was very welcome to come to his library and read all day long. Soon after this denial, on one very frosty morning the professor, not being able to get his fire to burn, sent to the poor student to borrow a pair of bellows. 'No,' said the youth, 'I never lend my bellows to any one, but the professor is quite welcome to come here and blow my fire all day long.' At an early period, when books were exceedingly rare and valuable, from their existing only in the form of manuscript, it was but reasonable to refuse to lend them, as their accidental loss would have been irreparable. It was customary then to secure them to the shelves by chains, ropes, bolts, &c. The library at Grantham still contains several books attached to chains. During the thirteenth century, so scarce and precious were the manuscript books, that it sometimes happened that if a religious council were assembled, and wanted to consult the works of the Fathers, they had to send to a considerable distance to borrow them at much expense, giving a heavy security for their safe return. The works of eminent medical men were so rarely to be met with, that on one occasion, when a king of France wished to possess a copy of the writings of Baize, a celebrated Arabian physician, the faculty of medicine of Paris would not lend it even to the monarch without pledges. Heber, the great book-collector, intended to have bequeathed his extensive library to the British Museum, but he altered his will, in consequence of the authorities at that institution refusing to lend him a rare work, which he wished to compare with one in his possession, he being at the time confined to his house, and unable to go to the library. The condition on lending a book, that the borrower is not to take upon himself to lend it, is very necessary with many free-and-easy sort of people. Charles Lamb, writing to Coleridge, says, 'Why will you make your visits, which should give pleasure, matter of regret to your friends? You never come but you take away some folio, that is part of my existence. I had no right to lend you the book you have just taken. I may lend you my own books, because it is at my own hazard, but it is not honest to hazard a friend's property; I always make that distinction.' Many a reader must have had the mortification to find that books, if often lent, return to him no more. We can call to mind a long list of works, and solitary volumes of works, that have had leave of

absence, but are never likely to rejoin their regiment. Some time ago, the 'Sydney Gazette' contained an advertisement from a gentleman, requesting his friends to return various books that they had borrowed, and, by way of inducement, promising to lend them more afterwards. Sir Walter Scott, on lending a book to a friend, begged that he would not fail to return it, adding good-humouredly, 'Although most of my friends are bad arithmeticians, they are all good book-keepers.' This joke of Sir Walter's reminds us of some one's witty verses, entitled 'The Art of Book-keeping,' in which the following lines occur:—

'How hard, when those who do not wish
To lend—that's lose—their books,
Are snared by anglers—folks that fish
With literary hooks;

Who call and take some favourite tome,
But never read it through;
They thus complete their set at home,
By making one at you.

Behold the book-shelf of a dunce
Who borrows—never lends;
Yon work, in twenty volumes, once
Belonged to twenty friends.

New tales and novels you may shunt
From view—"tis all in vain;
They're gone—and though the leaves are "cut,"
They never "come again."

For pamphlets lent I look around,
For tracts my tears are spilt;
But when they take a book that's bound,
'Tis surely extra-guilt.

A circulating library
Is mine—my birds are flown;
There's one odd volume left, to be
Like all the rest, a-loane.

I, of my Spenser quite bereft,
Last winter sore was shaken;
Of Lamb I've but a quarter left,
Nor could I save my Bacon.

They poked my Locke, to me far more
Than Braham's patent worth;
And now my losses I deplore,
Without a Home on earth.

Even Glover's works I cannot put
My frozen hands upon,
Though ever since I lost my Foote,
My Bunyan has been gone.

My life is wasting fast away—
I suffer from these shocks;
And though I've fixed a lock on Gray,
There's gray upon my locks.

They still have made me slight returns,
And thus my grief divide;
For oh! they've cured me of my Burns,
And eased my Akenside.

But all I think I shall not say,
Nor let my anger burn;
For as they have not found me Gay,
They have not left me Sterne.'

To an advertisement of a recent work on *Surnames*, the publisher adds this line of recommendation:—'An amusing volume, which comes home to everybody.' If so, it must be a capital book to lend, for most works are sadly deficient in instinct to find their way home.

Last year it was stated in the Chamber of Deputies that, through lending works from the Bibliothèque Royale at Paris, no less than twenty thousand of its volumes are lost, and a great number mutilated. The manuscript of Molière, stolen thence in 1825, was recently offered for sale by auction in Paris, the minister of public instruction not being able to recover it by means of the tribunals, for want of any mark to prove its identity. By recent regulations, this valuable library is protected from the recurrence of such depredations. In our own country, the British Museum has not escaped from stealers of books, manuscripts, prints, and specimens. To steal from such places as these—free, public,

national libraries—is not only a crime, but a folly, as it is like trying to rob one's own library, for it already belongs to everybody. The universal feeling ought rather to be an anxiety to add something to it, than a mean wish to filch from it.

SINGULAR ADVENTURE WITH A LION.

The following is told on the authority of Mr Moffat, the Cape missionary:—A man having sat down on a shelving low rock near a small fountain to take a little rest after his hearty drink, he fell asleep; but the heat of the rock soon disturbed his dreams, when he beheld a 'large lion crouching before him, with its eyes glaring in his face, and within little more than a yard of his feet.' He was at first struck motionless with terror, but recovering his presence of mind, he eyed his gun, and began moving his hand slowly towards it, when the lion raised its head and gave a tremendous roar; the same awful warning being repeated whenever the man attempted to move his hand. The rock at length became so heated, that he could scarcely bear his naked feet to touch it. The day passed, and the night also, but the lion never moved from the spot: the sun rose again, and its intense heat soon rendered his feet past feeling. At noon the lion rose and walked to the water, only a few yards distant, looking behind as it went, lest the man should move, when, seeing him stretch out his hand to take his gun, it turned in a rage, and was on the point of springing upon him. But another night passed as the former had done; and the next day again the lion went towards the water, but while there, 'he listened to some noise apparently from an opposite quarter, and disappeared in the bushes.' The man now seized his gun, but on first essaying to rise, he dropt, his ankles being without power. At length he made the best of his way on his hands and knees, and soon after fell in with another native, who took him to a place of safety; and, as he expressed it, with his 'toes roasted.' This man belonged to 'Mr Schmelen's congregation at Bethany.' 'He lost his toes, and was a cripple for life.'

AN INCONSISTENCY.

The horror which is especially evinced in the minds of us all by the death of one man by railway accident, more than by other means, I have often thought must result from the idea that at any time it may be our own case; yet here are thousands upon thousands annually destroyed around us by means as fatal, but, with common care, more easily prevented, which at any moment may seize upon the strongest of us; and this, until lately, with scarcely a word or a thought upon the subject. Happily, however, we are now on the eve of a great and glorious and irresistible change.—*Report of H. Austin, Esq. on the Sanitary Condition of Worcester.*

THE SIN OF BUILDING UNWHOLESOME HOUSES.

It is proved that, besides the waste of money, health, and life incurred by the system now usually pursued in erecting the lower classes of dwellings in great towns, where comfort, cleanliness, and decency are either not thought of at all, or are sacrificed to a short-sighted greediness of gain, there is also an incalculable amount of demoralisation attributable to the same causes; and that, to say the least, an effectual bar is thereby put to the intellectual, moral, and religious improvement of this large portion of the community.—*Letters of the Rev. C. Girdlestone.*

SALE OF NEGRO CHILDREN.

According to an advertisement in a New Orleans newspaper, the following 'orphan children' are offered for sale:—'John, aged about twelve years; James, aged about eleven years; David, aged about nine years; Cyrus, aged about nine years; Yellow Alex., aged about eight years; Black Alex., aged about eight years; Abraham, aged about five years.' Negro children are usually valued by their weight, that being considered a pretty good criterion of their health and strength. The custom, accordingly, is to place them in the scales. A likely boy will fetch from five to six dollars a-pound; but some go as high as nine dollars a-pound.

No. 168. NEW SERIES.

SATURDAY, MARCH 20, 1847.

PRICE 1½d.

WHAT IS LIFE?

I do not mean to perplex myself either with physiological or psychological questions. I will rather set out with assumptions which will be understood by all, and contradicted by none. Judging by the conduct of men, and by their sentiments, from Job downwards, Life, abstractedly, must be considered the *summum bonum*—the mere privilege of living the highest boon of Providence. Exceptions to this rule might no doubt be pointed out. Cases might be mentioned in which life has been considered secondary to honour, fame, the gratification of pride or revenge, or relinquished in favour of the mere tranquillity and unconsciousness of the grave. But these are the cases of a few individuals out of the myriads of mankind, for, generally speaking,

'The weariest and most loathed worldly life
That age, ache, penury, imprisonment,
Can lay on nature, is a paradise
To what we fear of death.'

It is therefore worth inquiring—What is the nature of the gift we estimate so highly? What is the real loss we sustain in its deprivation? What, in short, is Life?

Some philosophers tell us that life is combustion, and that the poets, by the inspiration of their art, suggested the true definition when they likened it to the flame of a taper. This may be true, or it may not; but it is wide of my present purpose. In asking what life is, I mean to put a moral, not a scientific question, and address it not to the learned, but to the ignorant. In like manner, if I inquired what is the body? I should be answered by the chemist that it is a combination of carbon, lime, iron, and various other substances; but I would rather be told, by the ordinary world, of its bones, sinews, and muscles.

Life can only be known to the general inquirer by its action. We do not know how we come to live, but we know that we do live. How do we know this? By our sensations; which sensations are the germ of our ideas, the elements of all our thoughts and feelings. If this be true, it is incorrect to say that one of the lower animals is as conscious of life as a man. The power of the germ can only be measured by its development; and the farther this development is carried, the greater consciousness of life there will be. A man, therefore, has more life, so to speak, than an animal; and a thinking and civilised man, than a savage. If we could strip a thinking and civilised man of his intellectual faculties, one by one, we should find him descend in the scale of animal being till he landed in the brute nature. In that state he would still live. The functions of the body requisite for sustaining life would still go on; but he would have a smaller portion of the principle of life,

a less exquisite consciousness of life, a less full enjoyment of life.

If life is the *summum bonum*, the more we have of it the better. The portion of the mere physical man is contemptibly insignificant when measured with that of the intellectual man; and this not comparatively, but positively. I mean that the two portions are not of the same value to the individuals possessing them, even taking into consideration their relative social position; a fact which will at once appear, if we suppose the two individuals to be in the same station in society. The case is not altered, however, if we suppose them to be, as they generally are, in different or opposite stations—the one rich, and the other poor. A thing is said, economically, to be worth just as much as it will fetch; and so it is with life as we are now considering it. The smaller portion is little more than sufficient to keep the functions of the body in movement, while the latter not only does this, but opens a thousand sources of pleasure and profit to the mind. Life, in this sense, may be compared to money. A small sum enables us to provide for our physical wants; while a large sum surrounds us with comforts, elegances, and luxuries. It is nonsense to say (though it is frequently said) that the small sum is as much to the poor man as the large one is to the rich; for this is to suppose the former to be fixed immovably in his condition of poverty. When the poor man becomes rich, his views extend, his desires soar, his wants multiply in proportion; and even so, as the ignorant man amasses stores of knowledge, he feels a thousand delightful and hitherto unknown sensations superadded in his being—a new world spreads before his eyes, a new heaven opens upon his soul.

Let us consider the first experiments of a child in the exercise of his faculty of sight. Everything is new and strange to his eyes. He confounds forms and distances, or rather he has no such perceptions as those of form and distance, till these gradually awaken from the action and reaction of the other senses with the one in question. At length he recognises objects, persons, places, and insensibly acquires that degree of knowledge which enables him to move without danger, and play his part in the social circle around him. If he stops here, he is indeed different from the brutes, because he belongs to a more perfect race of animals; but in various instances he suffers himself to be outstripped by them, without seeking compensation in the higher faculties of his being. Nature has lavished her skill on the external senses in the lower animals, but denied to them intellectual development; while man she has endowed with the power of almost endless progress, though originating in less acute organs of touch, taste, smell, sight, and hearing. In most of these an ignorant man in civilised society is inferior to his dog; and it is only in the savage, who, owing to his being entirely

excluded from intellectual exercise, is thrown back upon such rudiments, that the animal finds a worthy competitor.

But we shall suppose that the individual in question is not satisfied with using his sight merely to know his friends or enemies, merely to enable him to work or to play, merely to enlighten the small circle of his daily employments, like the candle which illumines his cottage room. In him this wonderful faculty, without being really increased in acuteness, receives, when in combination with the other powers of his nature, a higher development. It enables him to traverse the whole earth, to become familiar with all the kingdoms of nature, to penetrate into the regions of space, to number the stars of heaven, to measure their distances, to trace their paths through the sky. What a different faculty is sight in this man from that of the human clod! But each of the other faculties is, in like manner, acted upon by the rest, and the results are as wonderful in all. The senses are originally less perfect in man than in the lower animals; but their combinations occasion developments so grand and godlike, that we lose in their contemplation all thought of the humble germs from which they sprang.

'I think: therefore I live,' says the philosopher. But the two actions cannot be separated. Life is thought. A thinking man lives more than another, and he lives longer.

The complaint of shortness of life is, generally speaking, as absurd as it is common. It is usually made by persons whose lives are of no value either to themselves or society, and whose time merely consists of so many years. A dog might reasonably enough complain of the shortness of his life, since he uses his faculties to the best advantage in his power; but the complaint is ridiculous in a man who is satisfied with the life of an animal. With countless treasures within his reach, he complains of being poor, because he will not stretch forth his hand to grasp them! If life is thought, he has it in his power to live long. The slumberer, for instance, who is awakened by these lines into intellectual energy, will live as long in one day as he has hitherto done in several years. This may be illustrated by a very common circumstance. If we set out to walk over a plain unvaried surface—an expanse of sand, for instance—however tedious we may find the journey while in progress, it will appear short when it is over. In looking back, we have no data wherewith to measure. The line of time has a beginning and an end, and our thoughts have no halting-place between. If, on the other hand, we traverse the very same distance computed in miles, but diversified with towns and villages, woods and waters, hills and valleys, the converse will take place. The journey will appear short while we are in progress, for we shall have no time to think of its length, being carried away at every step by some new and interesting object; but on looking back in imagination, we shall find so many landmarks by the way-side, so many channels of thought intersecting our course, that the distance will seem immense. The number of miles may be the same, but the one journey is longer than the other, and we have lived longer during its course.

The monotony of life is another groundless complaint, occasioned by our failing to ask ourselves the question—What is life? Life is neither weaving, nor printing, nor digging: it is thinking. There is no employment so dull or uniform as to deprive its follower of the power of thought. Nay, the more mechanical the employment, the more opportunity it may be said to afford for mental cultivation. The shuttle has before now borne burthen to the 'lofty rhyme,' and it was no intellectual task-work which gilded the visions of him

'Who walked in glory and in joy,
Following his plough upon the mountain side.'

There are few avocations of so absorbing a nature as to afford no time whatever for the exercise of the faculties

in the acquisition of knowledge; and there are few so ill remunerated as wholly to exclude their follower from the stores of thought that are now so widely diffused by the press. To complain of the monotony of life, is to complain of inertness of mind. Among the lower classes, this inertness is the slumber of faculties that have never been awakened; among the upper (who term it *ennui*), it is the weariness of faculties that have wasted themselves upon contemptible pursuits, and when these have palled, have not energy enough left for anything higher or nobler. In the former case, the individual frequently takes to drinking, and is pitied by the unreflecting, on account of the temptations to which he was exposed by his monotonous trade; in the latter, he is graphically described as being 'used up'—he has nothing more in him, and is only fit to be laughed at on the stage, shoved aside in the streets, and walked over in the crowd.

To live is not merely to touch, to taste, to smell, to see, to hear: it is to use all our faculties in the highest condition of development our opportunities permit. This, and not the other, is the *natural* life of man. A person whose mind is vacant is like a stunted plant, kept down from its proper growth by insufficient light, or heat, or air. This is as yet, to a certain extent, the position of us all; for the mind of the world is only in the process of awakening from the slumber of ages. We are only pressing forward to the accomplishment of an unknown destiny. We have not yet reached our state of nature; we have not yet thrown completely off the shackles of circumstances that so long impeded our growth, and strangled our energies. But we are on the way, and that is much. Life, in its higher sense, which was formerly confined to individuals—

'Lights of the world, and demi-gods of fame'—

now pervades the masses of the people. It exists in the hut as well as in the palace, in the workshop as well as in the study. And the result of this approach to intellectual equality is moral sympathy; for there is a freemasonry in knowledge which, in spite of physical and social differences, makes men brethren. No one who has his eyes open can fail to recognise this fact. It accounts clearly and intelligibly for appearances which would else give the lie to all history. Before the general advance of knowledge, social prejudices in this country are vanishing like mists before the sun, and political prejudices have already wellnigh disappeared. It may, indeed, have been from sheer exhaustion that, after a twenty years' war, the states of Europe relaxed their gripe of each others' throats; but it is owing to the general progress of knowledge that the torch of war has never since been rekindled, and that, after a thirty years' peace, we seem now as remote as ever from the madness of strife. The bellicose propensities of statesmen would no longer receive encouragement from the people—we should no longer see a crowd of simpletons rushing in with the offer of their 'lives and fortunes' at the first whisper of a project for defacing the image of God, and destroying the work of civilisation. But fortunately these propensities no longer exist, for statesmen themselves have shared in the spirit of improvement. Compare the aspect of parliament now with that which it presented before the battle of Waterloo—before the sins of the European kings were cast upon the back of a single sacrifice, and the poor scape-goat sent off to the wilderness of ocean! We may no longer listen entranced to the thunder of eloquence, or have our senses bewildered in the mazes of rhetoric, for the fortune of nations hangs no longer upon the intonation of a voice or the turning of a period; but a general good sense, a general tone of moral feeling, and a general yearning after the good of all, in contradistinction to that of cliques and classes, attest the progress of general knowledge.

Beautiful, no doubt, are the tree-tops, towers, and pinnacles that are gilded by the level rays of the morning sun; but the shadow which then broods over the lower portions of the picture is cold, and dark, and

dear. That sun, thank God, has now risen high above the horizon; and although the loftier objects of the scene are still clearly defined against the radiant sky, beneath we have light and heat pervading the whole surface, and opening flowers giving forth beauty and perfume from the humblest hillock, from the lowliest dell.

Let us turn our eyes for a moment

'O'er the dark reeward and abyss of time,'

where lights are gleaming through the gloom like stars upon the distant shore. These lights are the great men of antiquity. The genius of individuals survives, while that of nations is lost. Instead of tongues and peoples, we find only books and names; instead of cities and palaces, only tombs and ruins. A great cycle in the world's age was accomplished in the fall of the Roman empire. All antecedent realities were expunged, and only a few records here and there saved from destruction; and then a new course of existence was begun, and a new chapter of history opened.

How different is this era from the last! Instead of stars and darkness, we are in the midst of life and light. Ours is the age of a moral and intellectual movement, of which it is impossible to imagine the end. Science, instead of being locked up in temples and schools, is diffused throughout the length and breadth of the land; and the 'pale mechanic,' bending over his monotonous task, laughs at the ignorance of Pliny. But while indulging in a thankful pride, let us all—those who have the power to impart knowledge, and those who have the ability to receive it—let us all bethink ourselves of the higher responsibilities involved in our higher advantages. We, the people at large, occupy the place of the priests and thaumaturgists of the antique world, and we to us if we neglect the sacred fire committed to our charge! We are not like the shadows of bygone history: our spirits will survive in endless transmission. 'Forward!—forward!' is the cry of destiny. Awake, ye who slumber, from the slumber of your faculties! Read, listen, speak, feel, think! In one word—*LIVE*: for life is thought!

WANG KEAOU LWAN.

A CHINESE TALE OF BYGONE YEARS.

A curious little volume has come into our possession, purporting to be a Chinese tale, printed at the Canton press in 1839, and translated from the original by Robert Thom, Esq. resident at Canton. It is a small square book, done up in a green cover, with the title first in Chinese characters, and then in English. Yet even in English, the name of the work is somewhat hard to get through. It is as follows, WANG KEAOU LWAN PIN NEEN CHANG HAN, which words, as we learn from the preface, compose the name of the heroine of the story, and may be abbreviated into the more manageable terms, Wang Keaou Lwan. According to Chinese custom, the surname goes before the Christian name, and therefore Wang must be understood to be the lady's family appellation. She was, in short, Miss Wang; and by this, as well as by the more familiar name Keaou Lwan, we shall take the liberty of speaking of her.

Miss Wang's story is a romance of the affections, founded, it is said, on facts, and has been selected from a large collection of fictions by the translator, 'partly from being pleased with the manner in which the plot is developed, and partly from the quantity of poetry interwoven in the piece.' Within our limited space, we can do no more than offer an abridgment of the story, paraphrased in certain passages; but even in this partially altered form, the reader, we hope, will obtain a tolerably correct idea of the original. As a specimen of Chinese literature, the piece may not be without its

value, independently of any special interest in the story.

During the first year of the reign of the Emperor Teenshun [1458 of our era], a military chief named Wang was appointed to reside at the station of Nanyang, in the province of Honan, and forthwith went thither, taking his family, consisting of his wife and two daughters, along with him. The name of the elder of these maidens, who was about eighteen years of age, was Keaou Lwan, and that of the younger was Keaou Fung. Although only sixteen years of age, Fung was already betrothed to a cousin in a distant part of the country; and as she was married, and removed with her husband shortly after the arrival of the family in Nanyang, Keaou Lwan was left in a solitary and unpleasant position. To console her as much as possible, her father kindly invited her aunt, Tseaou, to come and reside as a member of the household.

Aunt Tseaou was a lively and obliging person, but her society failed to console her pensive and affectionate niece. Keaou Lwan's accomplishments and feelings were of an interesting kind. From her infancy she had been an ardent student of books; she could wield her pen, and compose with classic elegance; and it was only from being a favourite daughter, with rare excellence of character, that her parents had prevented her from being long since wooed and betrothed. Frequently would she sigh when standing in the pure breeze, or complain to the bright moon of the icy state of singleness to which she seemed to be doomed. Aunt Tseaou, who was very intimate with her, understood the feelings of her heart; but beyond her aunt, no one else, not even her parents, knew anything about the matter.

'One day, being the Tsing Ming term, she went to the back garden, accompanied by Aunt Tseaou and her waiting-maid, to play at the game of the Chinese swing or roundabout, by way of amusement. Just when in the very height of their noise and merriment, they suddenly espied, at a gap in the garden-wall, a very fine-looking young gentleman, dressed in mulberry-coloured clothes, and wearing on his head a cap or kerchief of the Tang dynasty, who was bending forward his head and looking on, calling out without ceasing, "Well done! well done!" Keaou Lwan got into a sad flutter, her whole face became the colour of scarlet, and hiding herself behind Aunt Tseaou, they precipitately made the best of their way for the fragrant apartment, and the waiting-maid went in after them. The student thus seeing no one in the garden, leaped over the wall, and entered, and immediately spying something or other among the grass, and taking it up, he found it to be a handkerchief of scented gauze, three cubits long, and finely embroidered. Of this he took possession, as if it had been a pearl of great price; and hearing the sound of people coming from within, he made his exit from the garden as he had entered it. Then taking his stand as before, in the gap of the wall, who should he find it be but the waiting-maid coming to look for the gauze handkerchief! The student seeing her go round and round again and again, and hunt here, and there, and everywhere, until perfectly fagged, at length smiled, and told her that he had picked up the object of her search.'

A chaffering conversation now ensues, in which the young gentleman mentions that his name is Ting Chang, that he is a son of Professor Chow, and is at present a student in the adjoining college. He has no objection to give up the handkerchief, but only into the hands of the fair owner; and to make her acquainted

with his reasons for this stipulation, he sends Keaou Lwan a piece of complimentary poetry.

Minghea, the waiting-maid, took the poetry and the message of Mr Chow to her mistress, who was impatiently looking for her return. 'In the midst of a reverie on the handsome appearance of the student, she saw Minghea, apparently in a great passion, enter the house. Keaou Lwan asked of her, "Have you got my gauze handkerchief or not?"

'Minghea exclaimed, "It is indeed a very strange piece of business! The handkerchief has got into the possession of young Master Chow, who lives at the western court. It is the same handsome young gentleman, dressed in mulberry-coloured clothes, who was standing at the gap in the wall, crying out, 'Well done!'"

"Very well," said Keaou Lwan; "and did you ask it of him?—that would have been right!"

'Minghea replied, "To be sure I did; and I have also obtained his consent to return it me."

"And why did he not return it you, then?" asked Keaou Lwan.

"Why?" answered Minghea; "he told me that his family name was Chow, and that his own name was Ting Chang; and that as the gauze handkerchief belongs to my young lady, my young lady herself must come and beg it of him."

"Indeed!" said Keaou Lwan; "and how did you reply to all this?"

"I replied to him," said Minghea, "that I would inform my young lady that such were his commands; when lo! he added, 'I have got a verse of poetry for my young lady, which I will trouble you to hand up to her, and when you bring me her reply, I will then return you the gauze handkerchief!'" Saying those words, Minghea took the peach-flowered billet-doux, and laid it before her young lady.

'Keaou Lwan, on seeing it, felt rather pleased than otherwise, so she broke it open, and found it to contain a stanza of poetry of four lines, each line consisting of seven characters. It was to the following effect:—

"The handkerchief which has escaped the beauty's hand, breathes fragrance beyond measure;
And Heaven has bestowed it on an admirer, who is acquainted with the sentiment of love!
With sincere respect I send you this couplet, which I hope may speak our mutual sentiments;
And I trust to convert the handkerchief into the scarlet thread which will guide me to the bridal chamber."

'Now, had Keaou Lwan been a girl of a determined mind, she would have cast away this gauze handkerchief as a thing not worth a thought; she would have taken the poetry and burned it, and told her waiting-maid that she would not let such liberties pass again with impunity. Had she been so, I say, then this mighty business had come harmlessly to an end!'

But Miss Wang, as already observed, was a little disconcerted at her apparently neglected state, and thought this not a bad opportunity of showing her worth, which she could not consent to bury in obscurity. She therefore took some of the finest flowered paper, and made answer in these eight lines:—

'My person is pure as a piece of jade-stone, without a single speck;
I am descended of an honourable house, the members of which have been generals and ministers;
Amid the silence of evening, I gaze at the moon with my mother;
In the daytime, having nothing else to do, I look at the flowers alone;
The pure bluish wootung-tree will only permit the rare phoenix to repose on its branches;
And the chaste emerald-coloured bamboo—how can it consent that the filthy crow should defile it?
I send thee to the orphan-like stranger from another part of the country—
That he trouble not his peace of mind, in hoping for what is unattainable!'

'Minghea having received this poetry, took it to the back garden, where she found Ting Chang still waiting

for her at the gap in the wall. "Now, sir," said she to him; "my young lady having sent you an answer, I expect nothing less than that you will forthwith restore me the gauze handkerchief."

Ting Chang took the poetry, and read it once over: the more he read, the more he admired Keaou Lwan's talents, and the more he was determined to engage her affections. He therefore still postponed giving up the handkerchief, and sent another poetical effusion to Keaou Lwan. This was a mode of intercourse in which the lady was fully a match for the gentleman. To repulse his forwardness, she replied in a set of verses which ended with the following recommendation:—

'I would advise you, sir, not to revel in foolish dreams,
But to exert yourself, attack your books, and endeavour to enter the college of the forest of pencils.'

'After this, it was tit for tat, song and chorus, reply and rejoinder, until, little by little, their mutual love ripened, and their intercourse by letter became unceasing. Minghea's steps were seldom out of the back garden, and Ting Chang's eyes scarcely ever left the gap in the wall: the poetry that passed between them was so voluminous, that we cannot here recite it all. It is sufficient to say, that the correspondence was at length discovered by Aunt Tseao, who scolded her niece at a pretty rate for her imprudence, and recommended her to tell Ting Chang at once that he ought to send the usual go-between, or marriage-arranger, to papa. Keaou Lwan being quite agreeable to have matters settled, very willingly followed her aunt's prudent counsel, and despatched Minghea with a fresh piece of poetry, the concluding lines of which were not likely to be misunderstood—

'When awake, I dread to hear the note of the solitary cuckoo, as it reminds me of my unmarried state;
When asleep, I feel grieved should wedded butterflies wrap themselves in my dreams; they are so much happier than I!
Dear Ting Chang! if you have indeed a sentiment of mutual pity and affection,
You will do well to employ the go-between to communicate a word in season.'

'Ting Chang having received this poetry, forthwith made use of his father's name, and sent the proper messenger to Captain Wang, soliciting the honour of his relationship by marriage. Now, although Captain Wang had a high opinion of both the student's talents and personal appearance, yet Keaou Lwan was his favourite daughter: moreover, she was thoroughly skilled in literature of all kinds; he himself was an old man; every public document, every letter that passed through the bureau of the military station, he depended upon his daughter to help him with; he could not possibly do without her, nor could he suffer the idea of her being taken away to a distant part of the country: for these reasons he doubted and delayed, and, in fine, would make no promise.'

A long correspondence ensued between the parties, the result of which was, that Wang remained inexorable as to the marriage or betrothal of his beloved daughter. Ostensibly, therefore, all communication was broken off; but secretly the poetical epistles were fired off on both sides as thickly as ever; and to make a long story short, Keaou Lwan and Ting Chang entered into a private marriage-contract, in which they had the consent and assistance of Aunt Tseao. The solemnities performed on this occasion were such as tradition sanctioned. Four contracts were fairly written out: one, according to a custom of the Buddhists, was burnt before Heaven and Earth, as a testimony to the good and evil spirits; one was kept by Aunt Tseao; and each of the two contracting parties preserved a copy.

As is usually the case with clandestine engagements and alliances, these private espousals turned out an unhappy affair. Professor Chow's term of official service being completed, he was promoted to be chief magistrate of Woo Keang, and he required to remove thither with his family. On an apparently reasonable excuse,

Ting Chang remained a short time longer in Nanyang; but at length his presence being required by his father, he found it necessary to obey the paternal injunctions, and remove to Woo Keang. These unforeseen changes proved a great affliction to the tender-hearted Keau Lwan; but, like a high-souled heroine, she counselled Ting Chang to obey his father, and, if possible, induce him to bring about the public solemnisation of their betrothal. The parting, which was very sad, produced the following interchange of sentiment in verse:—

‘TING CHANG.

Bound together by mutual sympathy, as fish to the water, so have we been evidently created for each other!

But, alas! when I think of my parents far away, I am compelled to tear myself from you.

KEAU LWAN.

In the flower garden, henceforward, who will look with me at the bright moon?

In the fragrant apartment, henceforward, I care not about playing at chess.

TING CHANG.

I only fear lest, your person being far distant from me, your affection may also grow cold.

I feel no anxiety about my literary essays not being complete; I only regret my absence from my spouse.

KEAU LWAN.

I droop my head, and speak not, but the feelings of my heart are perfectly alive to what is going on.

Though overcome with grief at the thoughts of parting, I perforce assume a look of content and satisfaction.

After a few days' travelling, Ting Chang arrived at his home in Woo Keang, where he saw his parents, and the whole house echoed with joy at his arrival. Now, unfortunately, the father had just made an arrangement of a matrimonial nature for his son with the member of a family of the same place; namely, that of Wei, the assistant magistrate, and had been anxiously hoping for his son's return in order to send the marriage presents, and conclude the match. The student, when he first heard of this, was by no means pleased; he was anxious to fulfil the engagement he had already formed. But making inquiries, and learning that Miss Wei was an incomparable beauty, and that her dowry would be immense, he—oh, human nature!—relinquished all thoughts of Miss Wang, or, as she now might be termed, Mrs Ting Chang Chow, and actually married Miss Wei. Wretch!

Poor Keau Lwan! She felt cheerless and forlorn. Upwards of a year had sped on, and, strange to say, she had not received the slightest intelligence of the absentee. One day Minghea came running in and told her of an excellent opportunity of sending Ting Chang a letter. An epistle was accordingly written, and forwarded; yet, after several months, no answer arrived. Another letter is sent; still no reply. Keau Lwan, to her horror, now hears a rumour of Ting Chang's marriage, and a letter full of severities is the consequence. Sinkew, a messenger, is hired to carry this conscience-awakener, and to insist on some kind of explanation.

Sinkew knew how to manage business of this kind. On arriving at Woo Keang, he begged for an interview with the faithless Ting Chang. He could not be refused. When Ting Chang saw Sinkew, his face became scarlet. He asked 'not of him any questions whatever, but taking the letter, thrust it up his sleeve, and hurriedly entered the house. After a brief space of time, he sent a servant boy to deliver a verbal answer, which was to the following effect:—"My master," said the boy, "has been married to the young lady of Mr Wei, the Tungche-foo magistrate, now about three years. The road to Nanyang is very far, and he can hardly be expected to go back there; and as a letter is a difficult thing to write, he relies upon you that you will deliver this verbal message for him. This little scented gauze handkerchief, in former days, belonged to Miss Wang, as well as this sheet of paper, which is a marriage contract; and he begs that you will return them to her, in order that she may think no more about him. Master at first wanted to have kept you to give you a dinner, but he

is afraid lest the old gentleman his father might be asking annoying questions, and getting surprised and angry, so he sends you these five mace of silver for your road expenses, and expects that next time you won't give yourself the trouble of a long journey for nothing."

'Sinkew, on hearing these words, got into a violent passion. He would not receive the money (although it amounted to the sum of three shillings!), but casting it indignantly on the ground, walked out at the great door, and exclaimed in a loud voice of reproach, "As for thee, cold-blooded and unrighteous villain that thou art, the wild beasts and the birds of prey are not such as thou! Alas, alas! thou hast deceived the too-confiding heart of my young lady, Lwan! but high Heaven will never grant you its protection for the iniquity you have done!" Having spoken these words, his feelings overpowered him, and he wept aloud. The passers-by, one striving with another, wished to learn the cause of his tears; and Sinkew related the whole of the circumstances to them with the greatest minuteness, so that in a moment the fame of Ting Chang's dishonourable conduct spread through the whole town and neighbourhood of Woo Keang, and people of any respectability, from that time forth, held him in no esteem; so true is the saying—

"If, in the common affairs of life, you do no actions which shock your own conscience, Certes in the wide world you will have no men to gnash their teeth at you."

'Let us now, again, relate how that Sinkew returned to Nanyang, and there seeing Minghea, how he blubbered and cried without ceasing. Minghea said, "I presume, by this, that you have met with some accident on the road? or, out and alas! perhaps my young master, Chow, is dead?" Sinkew only shook his head, and took breath for half a minute, then recounted all the particulars of his visit, and Ting Chang's reception: how that he would send no answer, but merely returned the scented gauze handkerchief and the marriage-contract, to the end that Miss Lwan might think no more about him. "I cannot for my life go in to see my young lady," added Sinkew, and brushing away the tear from his eye, he sighed deeply, and left the house.

'Minghea did not dare conceal from her mistress what she had heard, so she recounted everything that Sinkew had told her with the greatest exactness. The wretched Lwan, on seeing the scented gauze napkin, the pledge of love in bygone and more happy times, knew thereby that the story of Sinkew was no fabrication; and in a moment rage choked her woman's breast, while indignation flushed her lovely countenance! She begged that her aunt might wait upon her in the fragrant apartment, where she made her a complete narration of the whole. Aunt Tseon exhorted and admonished her to bear her hard lot with patience, but Lwan gave no heed to her friendly counsel. Three entire days and as many nights she spent in tears. She took out the little gauze napkin and turned it over again and again. Ah! how many recollections of her once happy moments did that now bring to her broken heart! She even sought an opportunity of destroying herself forthwith; but, upon reflection, said, "I, Keau Lwan, am the beloved daughter of a family of note; I was not without beauty, and the world said that I possessed some little talent; were I thus silently and obscurely to pass into oblivion, would I not thereby be conferring a great favour on my heartless lover?" With that she drew up thirty-two stanzas of poetry, intimating that she was about to take away her own life, and an ode or ballad of eternal resentment directed against Ting Chang. The following is a verse of the poetry alluded to:—

"As I lean against my door-post, and in grief and silence meditate on bygone scenes,
I sigh: alas! my dream of wedded life has now vanished like a smile.

Love, in early life, stirred up the rambling fibres of passion, and dragged the green and tender buds of my heart astray.
Rage now follows like a torrent, and shrinks these green buds to the withered rod of resentment.

Then I said, my lord will return true to his promise, as spring to her revolving period.
But now, alas! full well I know that 'all is vanity.'
I turn my head, and lean against the railing—the painful spot of our long farewell—
And all my sorrows for ten thousand years I lay at the door of the false and cruel east wind.*

'The remainder of the poetry is not recorded, but her ode of resentment was to the following effect:—

"This ode of hatred eternal, upon whose account do I now make it?
Ah! when I bethink me of its commencement, my heart is truly sad!
In the morning I meditate upon it, in the evening I revolve it in my mind; the painful thought never leaves me:
So I again take up this marriage paper, to declare the heartlessness of thy love!"

Here follows a long poem, full of simple imagery, which want of space obliges us to omit, and we hasten to the termination of our melancholy tale.

'Keaou Lwan's letters and poetry being now fairly written out, she wished again to despatch Sinkew with them, but the soldier knit his brows, ground his teeth, and would on no account consent to go. There was, then, no way of getting her letters sent to Ting Chang, when it so happened that, just at that very time, her father fell sick of the phlegm, and called Keaou Lwan to look over and arrange some public documents for him. In looking over these papers, she found one relating to a soldier, a native of Woo Keang district, who had deserted from that quarter, and had joined her father's military station at Nanyang. Lwan's heart immediately conceived the following project. She took all their former love correspondence, along with the newly-composed poetry relating to the taking away of her own life, and her ballad of eternal resentment—these she clasped in order, so as to form a little volume: then taking the two copies of their marriage-contract, she placed them within the cover: afterwards she made a parcel of the whole, which she put up in the form of a mandarin's public document: this she sealed, and wrote upon the envelope—"Captain Wang, who holds the seal of office of the military station of Nanyang, to the chief magistrate of Woo Keang, in the imperial district of Soochow, to be opened when seated in his public hall—these." This done, she despatched an accredited messenger with the same; and her father, Mr Wang, knew nothing whatever about the matter.

'That very night Keaou Lwan washed her person with the utmost care, and having changed her clothes, she desired Minghea to go and make her some tea, using this deceit to get Minghea out of the room. No sooner was her maid gone, than having first fastened the door, she made use of a stool to support her feet; then taking a white sash, she threw it over a beam, and tied it; next, having made fast the scented gauze napkin, the first cause of all her woes, round her throat, she joined it to the white sash in a dead knot, and finally kicking away the stool, her feet swung in mid air, and in a moment her spirit dissolved in ether, while her soul sought the habitations of the dead at the early age of twenty-one years!

"A little scented gauze handkerchief commenced and ended her tragic history!"

'Minghea then, having boiled the tea, was bringing it to her mistress, when she found the door fast shut. She knocked for some time, but no one opening, she ran in a great fright to communicate the intelligence to Aunt Tseou. This lady, along with Mrs Wang, speedily arrived; and the room door being forced open, words cannot describe the horror and dismay that seized them when the sad spectacle within presented itself to their view! Old Mr Wang was not long in hearing the dismal tale, and in an instant repaired to the spot. It were needless to relate the scene of sorrow that ensued:

* Among the Chinese, the east wind is the emblem of the faithless lover.

neither the old gentleman nor his lady knew for what reason their beloved daughter had committed this rash act. But it was necessary to take some steps for the interment of the body; and a coffin being procured, what was once the lovely and accomplished Lwan was, amid the tears and lamentations of the whole household, consigned to the silent grave!

'Let us now, however, relate how that his worship Keueé, the chief magistrate of Woo Keang district, received the public document from the military station of Nanyang. Having perused it, great was his surprise indeed; from times of old until then he had never heard of so extraordinary a case! It so happened that at that very time his worship Chaou, the Tuy Kwan [doctor of laws], in the train of the Imperial Censor Fan, had come to Woo Keang in the course of a tour for correcting abuses. Keueé forthwith laid the case before Chaou, and he brought it under the notice of the censor himself. His Excellency Fan took the poetry, the ballad, and the marriage-contract, and turned them, and revolved them again and again, so as to make himself thoroughly acquainted with, and get at the very marrow of, this strange piece of business. He deeply lamented the talent of Keaou Lwan, worthy of a better fate, while he viewed with no less abhorrence the cruelty of Chow Ting Chang. He commanded his worship Chaou to make secret inquiries about the gentleman, and next day had him apprehended, and brought up to the censor's public court for examination. His Excellency Fan interrogated him himself. Ting Chang at first persisted obstinately in saying that the whole was untrue; but the marriage-contract being produced as evidence, he did not dare open his mouth. His excellency the censor, in great wrath, commanded the lictors to give him fifty severe blows of the bamboo, and conduct him to the public prison. In the meantime he despatched a letter to the military station of Nanyang, to inquire if Keaou Lwan had in very deed strangled herself or not. After not many days, a reply came, containing the particulars of poor Lwan's untimely end, upon which the Imperial Censor Fan had Ting Chang taken out of prison and brought up a second time to his tribunal. The censor, in a voice of wrath, thus addressed him. "To treat with levity or insult the daughter of a mandarin of rank, is one crime: being already betrothed to one wife, marrying another is a second crime: leading to the death of a party concerned, is a third crime. In your marriage-contract it is written, 'if the man deceive the woman, may unnumbered arrows slay his body!' I have now no arrows here to slay thee; but," added he, raising his voice, "thou shalt be beaten to death with staves like a dog, so that thou mayst serve as a warning to all cold-blooded villains in future!" With that he shouted with a loud voice, as a signal to the bailiffs and lictors, who were in waiting. These, grasping their clubs of bamboo, rushed forward in a body, and tumultuously struck the wretched culprit, pieces of whose body flew about the hall in all directions, and in a moment a bloody and hideous mass marked the corpse of the betrayer of Lwan!

'Within the city, there was not one man who did not approve of this punishment, as well merited by his heartless cruelty. His father, Professor Chow, on hearing of this news, suddenly died of grief and indignation; and not long after, the daughter of Wei, whom Ting Chang had married, gave her hand to another.

'Reader! Why should a man court the wealth and beauty of a second bride, and turn his back on his already betrothed spouse? That it can bring him nothing but sorrow, let him read this story of bygone years!

It is with no light feeling of sorrow we add, that Mr Thom, the able translator of the foregoing tale, died towards the close of 1846 at Ningpo, where he had latterly filled the office of her majesty's consul. Mr Thom was a Scotsman by birth, and by indefatigable industry, and the possession of excellent faculties, along

with good literary taste, had achieved for himself an honourable distinction in China, where his services were in the course of proving valuable in no small degree to his country. Alas! like many sons of Scotia, who, relying on their own energies, have gone forth in quest of fortune, this amiable and accomplished individual perished in the midst of his usefulness, and has left many friends and relatives to lament his untimely loss.

MUSINGS AMONG THE MOSSES AND LICHENS.

HAVE I a single reader who never spent an idle summer afternoon upon a bed of mosses? I suppose scarcely one. But it is my belief that their number is small who have ever dreamed that nature has given to these mosses and to the lichens a far higher and more important commission than that of covering our hedge-banks, or scrambling up our old walls. The subject altogether, too, is an interesting one; and the vegetation, as contrasted with that of our fields and forests, has that sort of attraction which we might conceive Tom Thumb to possess in the realms of Brobdingnag.

In the order of nature, the lichen family comes first: let it be first here also. Every one is familiar with the ordinary appearance of a lichen: it is a dry, membranous, leathery-looking object, whose external aspect is seldom so inviting as to draw more than a passing attention. But if one would examine it closer, many wonders reveal themselves to us. A mass of cells, a number of little tubes of membrane, containing sporules of an oval form, an outer and an inner layer—these are what the microscope discloses of the structure of a lichen. Then the colour and appearance of these plants are wonderfully diversified. They may be seen drooping down from the branches of trees, in thick, beard-like bunches or tufts, and are well known under this form as the 'Old Man's Beard,' which, in their general aspect and hue, they closely resemble; or they are found begriming the face of a castle wall, or ruined church, with odd-looking patches of brown and yellow; or they glitter in the possession of a glowing golden colour, or paint the bare rock with all sorts of curious devices, and sometimes in the richest, sometimes in the gloomiest of colours; and sometimes they form little goblets, gray, and with crimson edges. They seem to be capable of existing almost everywhere, few places coming amiss to them. They may be seen clothing the surface of the vitrified forts of the Highlands, or creeping among the brushwood, and over the trunks of the forest. They may be found covering the weather-beaten rocks, or picking up a subsistence on the sea-shore; and when I mention that, in geographical distribution, they are scattered from the equator to the poles, and from the depths of the deserted mine to the limits of everlasting snow, I shall have conveyed a pretty extensive idea of the ubiquity of the race. Our own country is rich in the lichens, but they are not to be compared with those of equatorial regions, wherever a moist atmosphere and sheltered position favour their development. The more curious of our own species in appearance are—the singular lichen known as the 'Lungs of the Oak,' from the remarkable resemblance the plant bears to the lobulated appearance of the human lungs; the hair-like lichen, which covers oak-trees with a shaggy mantle; the crab's-eye lichen (*Lecanora parella*), common upon stones; and the goblet lichen, which is to be found ornamenting many of our heaths.

The origin of the lichens in many situations is a subject buried in mystery. Meyen has made some remarkable experiments upon the subject, the results of which leave one in a state of greater perplexity than before. He found that decomposed vegetable, and some inorganic matter, are capable of assuming organisation under the influence of water and light, and that the pulverulent matter of lichens is that which is subject to this kind of propagation; but species could only be propagated by sporules off the same species. Now, it is a striking remark made by another eminent botanist,

D'Urville, that pulverulent lichens are the first plants which appear upon the bare rocks of newly-formed islands; so that some sort of a clue seems to be thus afforded to us as to the manner in which the barren rock receives its first garment at the hands of the Creator. But some genera, closely allied to the common lichens, almost appear to be, says Frier, even meteoric productions; the leaves of some pines near Dresden were on one occasion suddenly overran on the side next the wind with these plants; the sails and masts of a vessel at Stockholm, on a hot summer's day, were instantly covered over with them; and he believes that the cobweb-like matter, so familiar to us all as spangling over our lawns, is really of this nature too, and not, as it has been believed to be, the result of the textile skill of a small spider.

Economically, the importance of the lichens may appear inconsiderable; but that would be a mistake. The Highland peasantry were, a few years ago, able to earn fourteen shillings a-week each by simply collecting the lichen known as the *Lecanora tartarea*, or cudbear, by scraping it with an iron hoop from the rocks on which it grows abundantly in the north of Scotland. Mr Loudon states, that, when collected, it was sent to Glasgow, where it was used for dyeing wool of a purple colour. But it yields to that sent from the Canaries in brilliancy of colour, and consequently in commercial value. The orchil, or archil, which is procured from the volcanic rocks of these islands, is imported into England for the use of the dyer in large quantities; the annual importation being valued at from £60,000 to £80,000. The well-known chemical test called *litmus*, is produced from the colouring matter of the same lichen. Others of the lichens afford yellow, red, and blue dyes. But these plants are of importance in another point of view: they often considerably contribute to, and sometimes even entirely form, the diet of man and animals. Every one is familiar with the fact, that the reindeer-moss forms altogether the food of that animal during the prolonged northern winters. The vast herds which are dependent exclusively upon this humble lichen for their support, gives us an exalted conception of the importance of the most apparently insignificant objects in nature. Linnæus says that no plant flourishes so luxuriantly as this in the pine-forests of Lapland, the surface of the soil being completely carpeted with it for many miles in extent; and that if by an accident the forests are burnt to the ground, in a very short time the lichens reappear, and resume all their original vigour. The Norwegians and Laplanders make a kind of bread with the lichens, upon which they subsist in the winter; and the Icelanders beat up the *Cetraria*, or Iceland moss, sold in our shops as a medicine, into a cake, and eat it with milk, thankful to the Providence which, in these inhospitable regions, sends them, as they say, 'bread from the very stones.' A lichen, called the 'Tripe de Roche,' forms a main portion of the food of the Canadian hunters; and it is mentioned that the very deserts of Asia produce a species of lichen in large quantities, upon which the nomadic tribes are frequently compelled to support themselves. Medicinally, the lichens were at one period of some importance.

We must now turn to the mosses. This family is a curious, and in some respects a very mysterious one. In appearance, mosses are exceedingly variable; in size still more so—some being but a line or two in total height, and some, the *Equisetaceæ*, several feet in length. Some of the mosses are beautiful hair-like plants: some resemble fir-trees, others cedar-trees: some the tail of a horse, whence a name of one order, *Equisetaceæ*; others, again, resemble plumes of feathers. The 'ostrich plume' moss is common in the north of Scotland; and there is another which bears the name of the 'crested feather,' from its resemblance to such an object. They take on all shades of colour; they are green, or glittering yellow, or brown, or red, or rose-coloured. There is a pretty moss which clothes the sides of St Winifred's Well at

Holywell in North Wales, which seems stained with blood; and of course there is a legend that poor St Winifred's head was cut off and rolled down there, and that it was her blood which for ever after tinged the moss, as an undying memorial of the murderer's cruelty. The moss family, by the way, has often figured among traditional stories in a manner of which the above is an example. It is, however, upon the field of the microscope that the mosses appear in the most unaccountable light. In the minute false anthers of some species there are delicate cells, each containing what seems to be a living animalcule, analogous to those known as the *spermatozoa* among animals. These minute animalcules, if they are such, have short, swollen bodies, with long spirally twisted tails. When placed in water, the cell gives way, and out comes the tiny creature, and swims about in the water with the most wonderful activity. The microscope cannot determine whether it is an animal, as it appears to be, or simply a modification of vegetable tissue. Dr Lindley says, 'It is so improbable that animals should be generated in the cells of plants, unless accidentally, that we cannot but entertain grave doubts whether, notwithstanding their locomotive powers, these bodies are really anything more than a form of vegetable matter. As to the motion, how are we to tell that it is not a hygro-metrical action?' The latter cause produces some singular effects among the mosses: there is a common hedge-bank moss, of the *Scale Moss*, or *Jungermannia* order, the spore-cases of which burst on the application of a little water, and disperse the minute spores in a delicate cloud in the air. Intermingled with the spores themselves are very delicate spiral spring-like bodies, which may be seen twisting and writhing upon the field of the microscope. Similar movements are common among others of the family.

The mosses, like the lichens, are cosmopolists. The split mosses luxuriate in the bleakest spots in the world, and are among the last remnants of vegetation as we ascend the Alps, fringing around the limits of eternal snow. Some of the urn mosses are only to be found at an elevation of seven or eight thousand feet. From these heights downwards, and from the tropics to the poles, certain members of the family are to be found. The mosses are not so directly useful to man as the lichens. In Lapland they form soft beds of them, and they are also used as lamp-wicks; the poor reindeer, too, ekes out its provision with some of these plants, which is about all that can be said of them.

Conjointly, the mosses and the lichens may be described as the pioneers of vegetation; and it is principally to their importance in this light that I have been desirous to draw attention on the present occasion. Is a volcanic rock, barren and rugged, to be clothed with vegetation, decked with flowers, adorned with trees?—the lichen and moss are the apparently feeble instruments which are to effect it. The pulverulent lichen goes before, it fastens upon the sterile surface, clothes it with its first coat, and gives place to the foliaceous lichens, these to the liverworts, and these to the mosses. Let these, then, decay; let them be torn by the mountain torrent, or by the shower of rain, from their site, and mixed with the detritus it is bringing down, and we have the nucleus of a soil already formed. Now, let the wind-carried or the water-borne seed rest here, and the second step is taken; and from hence the progress is continued. Every day brings a fresh arrival, every tempest a new plant; the zoological immigrants come next; man himself succeeds; and the once barren rock has become a fertile and inhabited island. The ubiquitous habits of these plants pre-eminently mark them as capable of performing this office in all parts of the globe; the progress will be more rapid where other circumstances are more favourable to the development of vegetation, but in any case, it is equally certain eventually. 'The lichens,' says Sir W. J. Hooker in the *Botany of the Antarctic Voyage*, 'form a large part of the vegetation of Kerguelen's Island to an altitude of

fifteen hundred feet: the rocks are apparently painted with them. At the tops of the hills they assume the appearance of miniature forests, some of them being like little oak-trees.' The rocks were painted down to the edge of the sea with black, lilac, yellow, and light-red lichens. Then, in the opposite direction, Scoresby relates in his arctic voyage that where not a trace of vegetation was yet to be discovered, he found lichens in abundance upon the wildest rocks. Then, again, Bory St Vincent found them luxuriating upon the volcanic rocks of the Isle of Bourbon; and Darwin mentions that at Iquique, on the coast of Peru, he travelled for fourteen leagues without seeing any other vegetable on its arid soil than a yellow lichen. 'The first green crust,' writes the accomplished author before quoted in this paper, 'upon the cinders of Ascension, consisted of minute mosses; they form more than a quarter of the whole Flora of Melville Island; and the black and lifeless soil of New South Shetland is covered with specks of mosses struggling for existence. In the economy of man, they perform but an insignificant part; but in the economy of nature, how vast an end!'

The past pages of the earth's history reveal to us, with relation to members and allies of the moss tribe, things more wonderful still. The Equisetaceae, or horse-tails, in particular, at a former period, seem to have played a more important part, or to have found conditions more suitable to their luxuriant development, than is the case at the present day. What should we think of an equisetum with a trunk of a foot in diameter, and twenty or thirty feet in height? Yet such are the dimensions of some of the fossil specimens. The club mosses, also, are thought to have entered largely into the composition of coal; but, says Adolphe Brongniart, the vegeto-fossilologist, their height was infinitely superior to any of the existing plants. Some of them are stated to have formed even lofty trees eighty feet high, with a proportionate diameter of trunk! A few inches would measure the tallest of them now. It is even thus far, then, that we have been carried to the very boundaries of the inscrutable by our musings among the mosses and lichens.

A MEXICAN REVOLUTION.

If any respect was ever paid in this country to Mexico, it has long since disappeared. No nation on the face of the earth occupies at this moment so low a position. The people, it is evident, cannot govern themselves; they have neither the sense to be quiet under authority, nor the ability to frame a government which can protect itself from dissolution. Their conduct is a curious mixture of childishness and wolf-like rapacity; but what else can be expected from three centuries of Spanish mismanagement? The government of a band of robbers is as little favourable to intelligence as public and private virtue.

Incapable of managing themselves, the Mexicans are for ever breaking out in revolutionary tumults; a revolution being by them called a *pronunciamiento*—that is, a declaration in favour of some new chief. The narrative of one of these serio-comic events, by an eye-witness, presents so striking a sketch of revolutionary tactics and achievements, that we shall permit him to tell his own story, premising that, having travelled for several years along the western coast of the American continent, he was well qualified to describe the proceedings of which he was a spectator. On his way northwards he had touched at Guaymas, which city he found in an uproar. 'A revolution,' he says, 'had broken out some days before, and the history of this is the history of all revolutions in Mexico; as absurd in origin, and contemptible in result, as they are original in detail.'

'The commandant of the place, General Tobar, was an old soldier, active and crafty, who, having been for several years engaged in pacifying the native tribes, became weary of constrained inaction. The fame of the president Santa Anna, the man of pronunciamientos

and counter-pronunciamientos, prevented him from sleeping. As it is always glorious for a Mexican to pronounce for or against his rulers, General Tobar declared against the president as soon as he heard of his downfall. Such an event deranged all the general's plans, and delayed their execution. To get rid of his vexation, he mounted his horse, and gave himself up with more spirit than ever to his favourite pastime. Reclining on the broad Mexican saddle, and supported by the massive stirrup, he galloped across the plains in pursuit of the wild cattle. Singling out a bull, he seized him by the hairy tuft at the end of the tail; the animal lowered his head to resent the insult, but his persecutor speeding by, still retaining hold of the tail, lifted his hind quarters from the ground, and before the bull could understand the proceeding, with a rapid summer-set he was left breathless on the ground.

The general was sometimes assisted in this diversion by his lieutenant, Casillas, a soldier of fortune, intrepid and adventurous as the companions of Cortez. He was what is called in Mexico a *hombre de a caballo*; that is, he could break a wild horse in two hours, pick up an object from the earth at full gallop, throw the lasso, and knock down three enemies at once—one with his sword, another with his stirrup, and the third with his horse. In the days of chivalry, he would have been a chevalier without fear, but not without reproach. Overwhelmed with debts, he was shunned alike by those who were his creditors, and those who dreaded being added to the number. With all these qualities, Casillas was only a lieutenant. General Tobar, however, considered him likely to make a good partisan, and as they rode along side by side after their merciless chase, he inquired abruptly of his subordinate—"Does not time seem dreadfully long to you, now that the state is so quiet? For my part I am quite tired of having nothing to do. The dogs of Indians give no further signs of life."

"You have pretty nearly exterminated them," answered Casillas gravely: "I wish I could say the same of my creditors."

"I have other subjects of complaint," continued the general, "as well as weariness. Is it not scandalous, on the part of the central government, to unseat the excellent Senor Santa Anna? My rank is only that of a garrison-commandant, while I merit something better. Where is justice now-a-days? I am resolved either to reinstate the ex-president, or make myself governor, and I count upon your aid."

"When shall we march upon Mexico," demanded Casillas laughing, "and call upon the sovereign congress to make me a captain?"

"I will let you know," replied Tobar majestically; "meantime, Santa Anna for ever!"

"Santa Anna or death!" shouted Casillas; and the two revolutionists rode back to Guaymas.

As soon as the scheme was concocted, confederates were found in abundance. Casillas was embarrassed in his choice among so many friends. They were principally young men of distinguished families, but depraved habits, some of them well known to the alcalde and his officials as implicated in one or two assassinations. The opportunity of paying their debts at the expense of others was too good to be lost, and they flocked eagerly to Tobar's standard. The night preceding the execution of their project, about twenty of the party met to deliberate on their proceedings. Opinions ran high; some were for burning the city and slaughtering the inhabitants *en masse*; others, however, opposed so barbarous a project, and at last a list of names was made out, whose owners were doomed to execution. Each man present considered it his duty to place on the list the name of the creditor he most feared, or the alcalde who had caused him most vexation. On this point Casillas kept a profound silence, as he did not wish for the destruction of the whole city. The next proposition was to march upon Mexico, after having made themselves masters of the fort. This led to a hot discussion. One suggested that if the garrison were not to be mas-

sacred, a bribe might purchase their co-operation; but there was not a single piastre among the whole company. The final resolution was, to surprise the fort at daybreak, and seize the public treasure, locked up in the revenue chest at the custom-house. Before they separated, Tobar was named governor of the state; Casillas was made a captain; each officer present rose a step in rank; and those who were only citizens, dubbed themselves officers.

At daybreak, the conspirators, armed to the teeth, marched silently through the city; and halting beneath the walls of the fort, summoned the garrison to surrender, with cries of "Santa Anna for ever!" The troop inside slept as men who had nothing to lose, and with little solicitation joined in the cry. The pronouncers were surprised at this sudden success, not knowing that the evening before the soldiers had sold their cartridges to compensate themselves for arrears of pay. At sunrise, the installation of the new government was known through the city. Some hours afterwards, General Tobar's chief officer presented himself at the residence of the receiver-general of the customs. The latter was taking his siesta in his hammock. Casillas saluted him with all the courtesy of a Mexican robber, and politely inquired if there was any money in the chest of the department.

"Twelve thousand dollars," answered the official.

"Not much," rejoined Casillas: "enough, however, to spare me the necessity of an unpleasant duty."

"What is that?" said the receiver-general, turning himself over in his hammock.

"To conduct you to my chief," replied the soldier; "for I promised to carry back either the treasure or the treasurer."

"At all events, captain, you will give me a receipt?"

"What! Yet it is but fair. I fear only that my signature may not be very valuable. Ah! Senor Administrator, I have been greatly calumniated in this country."

After giving Casillas the contents of the chest in exchange for his receipt, the treasurer continued his siesta. The captain went back laden with booty, which he deposited in Tobar's house, transformed for the time into the seat of government. At this sight the confederates broke out into shouts of triumph. There was but one opinion as to the destination of the twelve thousand dollars: they were to be employed for the public good. But the phrase public good admits of a thousand different interpretations. Every one understood it after his own manner, and gave his advice more or less disinterestedly, so that it became difficult to settle the question. After a long parley, it was decided, on the motion of Casillas, to devote the funds to repairing the gun-carriages, which the great heat of the sun had split and rendered useless. When the meeting was over, Tobar, after investing Casillas with his authority, rode out to his country-seat, after the manner of his patron Santa Anna.

A few days afterwards, one of the younger members of this self-elected government offered to introduce me to his associates at their nightly meeting in the only tavern of the city. In a small room about a dozen men were seated round a massive table drinking and gaming. A thick smoke from the numerous pipes increased the obscurity of the apartment, dimly lighted by a few long-wicked candles. A tall man, with strongly-marked features and dark eyes, and whose bushy whiskers reached to his mouth, rose on my entrance.

"Welcome, Senor Frenchman, for there are no serviles in your nation! Welcome! Bring a glass."

"France is a great nation," said a voice, half-choked by brandy, in one corner of the room, "and Napoleon is a great man. How is he?"

"I turned at this strange question: the speaker was an old sergent, seated against the wall, with an enormous rapier between his knees. He did not probably hear my answer, for with a heavy snore his head fell

forward on his breast. While I was looking at him, Casillas—for it was he who had welcomed me—again spoke in the sententious style borrowed from the Indians—"Calumny is the lot of the poor, Senor Foreigner. I have been poor, but now I am powerful. Who will prevent my taking vengeance? Nobody! Casillas can enter where fire enters, and reach where the wind reaches! But no; I will only avenge myself by benefits."

'At these words the future benefactor of the state drove his dagger into the solid table with a force that made the bottles and glasses jingle. The acclamations that followed were interrupted by the arrival of a messenger with the information that two regiments were on their way from Arispe to put down the rebels. This news threw the party into consternation; every one looked to Casillas for advice. Starting up, he said, "General Tobar must be informed of what has happened; which of you will ride for life or death to his seat?"

'A dead silence followed this proposition, and Casillas looked round with a gloomy frown.

"I will go," exclaimed Guttierrez; a young man of calm and modest appearance, who had not before spoken.

"I want a bully, a fear-nought, for the road is dangerous," replied the captain, looking at the young clerk, for such was the occupation of the youth who had volunteered for the journey.

"I will go," was all he answered; "I only want time to saddle my horse."

"Go, then, and luck attend you!" returned Casillas, taking him aside to give him the necessary instructions; and with a parting glass the whole party separated.

'In the course of a few days after this event, every trace of the twelve thousand dollars had disappeared, except Casillas's receipt to the receiver-general. Recourse was had to exactions, for the news from Arispe became more and more threatening. Tobar still remained at his country-seat, not sorry to devolve the responsibility of rigorous measures upon his captain. Some of the richer citizens had paid a heavy fine with tolerably good grace; but everything has an end, and the provisional government was at the end of its resources.

'At this juncture a large French merchantman was telegraphed off the mouth of the harbour. This was a piece of good fortune for the conspirators, as they hoped to touch the amount of duties to be paid on the cargo. The following morning I made my way to the top of a high hill which overlooked the port and the whole city. While looking on the ship standing slowly in, some one touched my arm. I turned round: it was Casillas.

"It is Providence that sends it to us so opportunely," he said, pointing to the ship, on which my eyes were still fixed. All at once the captain exclaimed, with a fearful imprecation, "Confusion! What demon is spoiling the affair? Look!"

'A cloud of dust was visible, moving rapidly across the plains on the opposite side of the city, above which the red pennons on the lances of a troop of cavalry fluttered in the bright sunshine.

"It is the governor-general," said Casillas, clenching his hands. "A day later, and we should have beaten or bought him."

'Whether a courier had already brought the news to Guaymas, or from some other cause, we could see from the height on which we stood that there was an unusual stir in the city. Casillas looked on with a haggard eye, but without moving. A few minutes afterwards, with a cry of rage, he exclaimed, dashing his hat to the ground, "The cowards—the traitors—the idiots! See! they are disbanding! Ah! there is Guttierrez on horseback: is he going to assemble our friends? No; he is off at full gallop. Stop!" he shouted in irrepressible wrath, as though his voice could reach the fugitive. "Look! there is the brave Tobar; he at least will not run away. All is lost! he is following the example of Guttierrez. The cowards—the traitors! legality fright-

ens them! they whom the yelling Indians could not intimidate. But I am there."

'Still denouncing the traitors, Casillas mounted his horse, which he had tied to a tree, and hurried at a furious trot down the steep descent. I followed him with my eye as he dashed along. He reached the great square in safety, where I lost him in the crowd.

'When I looked again, the place was empty. The governor's troops were just entering the city. By a singular coincidence, at the moment that the cavalry deployed into the square, in company with Indian infantry armed with bows and arrows, the vessel, which had so greatly excited the cupidity of the insurgents, entered the port; and at the same moment the last of the pronouncers—the captain—galloped from the city.

'In my subsequent peregrinations through the country, I fell in with the principal members of the provisional government of Guaymas, hiding in obscure villages, excepting one—Casillas—in whom I felt much interested; but his friends had never heard of him since the day on which his command came to so sudden a termination. Guttierrez the clerk went back to his desk, as though he had forgotten all about his daring midnight ride, and his share of the public funds. General Tobar was more fortunate; his rank placed him too high to be easily disturbed by a political storm. After a brief suspension, his command was restored to him; and the recollection of his pronunciamiento became confounded with many others which have shaken, and will again shake, the ill-constituted government of Mexico.

FIRESIDE CHIT-CHAT.

They talk about the duties of property, and some other things.

Stukely. I see you have been reading the paper. Any news?

Gilaroo. No, nothing but fresh discussions on that eternal subject Ireland, which I, for one, am getting quite sick of.

Stuke. Ah, all the landlords' blame. They have allowed things to go to utter confusion on their estates. Pity they should have forgotten that 'property has its duties as well as its rights.' What a noble saying of Drummond that was.

Gil. What kind of property do you mean?

Stuke. Landed property, to be sure; I do not think moveables could be meant. At all events, on landed property all the more important class of duties ought in reason to fall.

Gil. Then I beg to differ. The saying, so interpreted, is only a piece of rant.

Stuke. Is it possible? Do I, Stephen Stukely, actually, and in truth, hear you, Philip Gilaroo, gentleman, speak in that manner of one of the greatest sayings of the age?

Gil. If it be such a great saying, you will have less trouble in explaining in what its greatness consists.

Stuke. Why, the thing is as clear as daylight. The man who owns an estate, is under the obligation of looking after the people upon it; he must see that they have decent houses to live in; that the villages, if there be any, are kept in order; that there are schools for the youngsters; that there is a savings' bank to induce habits of economy; and that the roads in the neighbourhood are kept in proper repair. He must likewise feed the poor, and find work for the able-bodied men on his territory. I need hardly add, that he and his family are bound to set a good example, and hold out every encouragement to well-doing. Attendance at the parish church I should think a fair thing, at least now and then. Such are my ideas of the duties of property, and I fancy they are what poor Drummond had an eye to.

Gil. Well, such, you say, are your ideas, and they may have been Drummond's ideas, and possibly they may be a hundred other people's ideas; but all that is

no proof of their being founded in reason, law, or common sense.

Stuke. I never heard such a heresy. Are you mad, or only joking? Tell me plainly—do you deny that landed property has duties as well as rights?

Gil. That is not a fair mode of questioning. The way I treat the subject is this. A landed property is advertised for sale; its price is £40,000; it consists of twelve farms, which in the aggregate bring in a rental of £1600 per annum. Besides the families of the farmers, there are fifty other families, consisting of peasantry and paupers, the whole population on the property amounting to three hundred souls. The rent or return for the purchase-money is stated at £1600, but from this there falls to be deducted £200 for poor and other rates, making the net return only £1400. Now, I want to know what it is that I am called on to buy. What am I to give my £40,000 for? I imagine that it is the right to draw the existing rental; and not only so, but the power of improving the property, and so organising its economical management, that the free proceeds may be raised to perhaps £1700 or £1800, which, after all, would be no great return for my money.

Stuke. Well, I think that may be allowed without any harm to the argument.

Gil. If you make such an admission, your case is gone, or nearly so. It somehow appears that buying landed property is to be different from buying anything else. If I lay out my money in trade, nobody hints at an obligation; whereas if I invest it in land, for the like purpose of gaining a livelihood, up spring all sorts of responsibilities. Suppose I lay out my capital of £40,000 on the estate just spoken of, under the impression that I am to have the power of improving it, and increasing the rental to a fair return; lo and behold, no sooner do I come into possession, than I find I have no power whatever. The first thing I hear of is, that as property has its duties as well as its rights, it is my duty to keep up all the old tenures. In my dreams of improvement, I hoped to have thrown the dozen small farms into three large ones, each under a first-rate system of tillage. But this is against popular notions. I must not change anything. The providing of employment or subsistence for three hundred people has become my 'duty.' My rental, instead of increasing, threatens to diminish, by the obligation I am under to support the poor, who are annually augmenting in numbers. I hoped to direct my attention to study and rural pursuits; but my 'duties' tell me that I have no right to think of personal enjoyments. My business is to go about preaching industry and economy to the labouring classes, and I am expected to deliver occasional addresses to a mechanics' institution in the neighbouring county town. My wife also is never to be off her feet. She is to be the Lady Bountiful of the district, going about distributing flannel petticoats to old women, and medicines to children. I have bought a life of ease with a vengeance!

Stuke. But think of the honour.

Gil. Hang the honour! Honour won't pay butchers' bills, or send my sons to college, or my daughters to boarding-schools. I tell you I have been cheated out of my £40,000.

Stuke. I cannot see that you have—you have got the estate.

Gil. Yes, but clogged with a thousand drawbacks. I seek money in land as an investment; that is, to get a certain annual return, of which I am in a great measure defrauded. I never undertook to be the responsible protector of three hundred people. The obligation was not in the bargain, and it is therefore unjust to enforce it. If landed proprietors are to feed, and see to the good behaviour of all the poor on their estates, they should have an allowance for their trouble; it should be remembered in the purchase-money.

Stuke. If the poor are not to be supported out of the land, who is to support them?

Gil. The nation at large to be sure. I cannot see any justice in moaned men, quiet, snug capitalists,

who live in large cities, and draw their four, five, or eight per cent. on investments, shirking every public duty whatever, the payment of some trifling tax excepted; while those who have adventured their money on land, are to perform gratuitously every imaginable duty which public clamour chooses to enforce. Mighty easy and pleasant it is for the city merchant or capitalist to sit at his comfortable fireside, conscious of well-paid returns on his investments, and, with the morning paper in his hand, rail at 'those hard-hearted landed proprietors, who are letting the poor die in scores on their estates.' How complacently he insists on the doctrine that 'property has its duties as well as its rights'—his own capital, of course, not being considered property, and therefore exempted from any sort of duties.

Stuke. Are you not forgetting one thing? If the man who buys an estate does not know the obligations he comes under, he ought to know them. I do not defend the exemptions of the city capitalist; I only repeat, that on land must always fall the heavy end of all public burdens. It is the only thing tangible. A man with unfixed capital may be here to-day and away to-morrow.

Gil. I remember that, but I remember something else which I conceive to be of more importance. If land is to be made the subject of all the duties and burdens which can conveniently be fastened on it, then no reasonable man will have anything to do with it. Capitalists won't look at it. They will be heard saying, 'I don't choose to invest my earnings in buying troubles and obligations. I am conscious of no vocation for nursing paupers or superintending public morals. Neither has my wife any desire to purchase a reputation by the distribution of carts of coal and flannel petticoats. Let those sink their money in land who please, I will invest mine in good debentures at five per cent. The interest will come in half-yearly, unburdened with a single obligation. Free from all annoyance, and no way accountable, I shall live in London, Paris, or anywhere else I please.' Is the world, with its sing-song about the duties of landed property, prepared for this climax?

Stuke. Your line of argument, I perceive, proceeds altogether on the principle of the *quid pro quo*. Now, in laying out money on land, there is a *quid* for the *quo*, although perhaps not in cash. The duties supposed to belong to property are paid for; they are paid for in honours, which all do not think so lightly of as you; or, to speak more explicitly, they are paid for in the political influence and territorial importance which the possession of land invariably gives.

Gil. Just so much the worse. Instead of paying for these duties in political influence, it would be cheaper and better to get them performed by distinct functionaries, receiving salaries from the public. If, in return for his services and responsibilities—his 'duties,' as you would call them—a landed proprietor gets two or three of his sons fixed on the public, then the public is paying in a round-about and wrong way for these services. Better, I say, relieve him of his services and duties, and hire a person to perform them in a proper manner. It is a notorious fact, that one settled stipendiary magistrate in a county, being a man trained to the profession, will do more work, and that work better, than fifty justices of the peace. The dearest and worst-executed duties are always those done for the sake of presents or underhand payments. The public are not wise in seeking to impose duties, not directly paid for, on landed proprietors. These duties they get paid for in all sorts of shabby ways—ways which I would despise. It may indeed be said that in requital they have the pleasure of managing the country in their own way. You have alluded to the honour obtained by owning land. And I wish it was only the visionary thing I hinted at. In too many instances, I am bound to admit, it is a *quid pro quo*: in short, land is frequently bought as much with a view to political advantages as pecuniary returns. But this is a social wrong, not to be wrested in argument.

It is a contraband arrangement, which we may lament, and hope to see redressed; yet I fear the day of redress cannot be expected to arrive while the cry about the duties of property is kept up; seeing that no man, in violation of ordinary maxims, will undertake to perform duties for which he is not in some way or other to be rewarded. Putting aside, therefore, the plea that political weight is a fair equivalent for the real or imaginary performance of duties which should have no existence, I come to the plain commercial principle, that land, as an article of value, is only worth its computed return in money; and that, having been so bought, it is no more subject to be burdened with duties and obligations than any other species of property.

Stuke.—Am I to understand it to be your opinion that a landed proprietor is not bound to look after and care for the people on his estate?

Gil.—Certainly not bound. It may be consistent with his feelings to take a kindly interest in the welfare of those about him, on the common principle that we are all concerned in helping to improve the condition of society; but beyond this the landed proprietor is under no obligation. According to a right kind of social organisation, every man is free. Feudalism—the age of lord and vassal, baron and serf—is gone; and I should not like to see it return, after it has been kicked out of nearly every European state as the enemy of popular rights. And yet the cry about the duties of property indicates a longing for a return of feudalism. It is an attempt to make the landed proprietor a baron, and those in his employment serfs, as far as such can be done without the absolute injunctions of law. I cannot consider the attempt to be either expedient or humane. The humbler classes cannot, without degradation, force themselves into a state of lifelong dependence on superiors. They cannot deem it a privilege to be fed like a great man's hounds. Nevertheless the obligation of feeding them is spoken of as one of the imperative duties of a landed proprietor.

Stuke.—And so it is; the poor are entitled to be fed out of the land. The good old law of Elizabeth settled that at any rate.

Gil.—According to this much-to-be-venerated good old law, human beings are to be treated as trees indigenous to the soil. The parish in which they were born is to be their habitat for all generations. No one must attempt to transplant them to a spot more favourable for growth. There they are everlastingly pitched. Increasing in numbers where they grow, the landowner must do nothing to thin them. His 'duty' is to find them accommodation; and if they at length cover the whole ground, and use up all its produce, he must submit, and be the first to vacate. Here, then, is the blessed consequence of giving a man the right to be fed out of the land—universal pauperism. A law to prevent social improvement could not have been more skilfully devised.

Stuke. But how can all this be remedied? The poor must be fed.

Gil. True; but not exclusively by the owner of that portion of the earth's surface on which they happen to be born, or to have lived for any period of time. The duty of supporting the poor is universal, and consequently all parochial distinctions in this respect ought to cease. The poor man's parish should be anywhere and everywhere, and the funds for his support ought to be collected as a general tax on property, heritable and moveable. Were this done, there would be a universal improvement in the prospects of the humbler classes. Instead of vegetating and pining in some obscure rural district, they would roam abroad, seeking for the means of independent subsistence, conscious that, wherever they chanced to be, they would, in the event of misfortune, be saved from utter destitution. Such, I apprehend, must be the true reading of the cry that 'property has its duties as well as its rights': the 'property' must mean all realised property whatsoever—the fund, in

short, out of which the entire machinery of the commonwealth is to be kept in life and motion. If it do not mean this, it is only the cry of a party, an unreasoning sound.

Stuke. I am sorry I cannot go that length. I hold by the doctrine that landowners are, among other things, mainly bound to support the poor. I have seen it argued with much force that the duty of supporting the poor on his estate induces a proprietor to supervise their morals, and prevent as far as possible over-population. That is a benefit which would be lost by absolving him from his duties.

Gil. That won't do. By your own confession, the landlords have allowed things to go to confusion on their estates, and it is admitted the poor are as badly off as may be. And why? Every proprietor is left to work in his own way, or to do nothing at all, if it pleases him: there has been no general concert of measures as to the providing an outlet for the poor. It is a mere delusion to expect that any landed gentleman, single-handed, can keep down pauperism; he either cannot or will not; and in that precise position the subject now rests. It seems tolerably evident that unless the whole public, through the state, are made to feel that they are concerned in supporting the poor, or in finding an outlet for them, the poor will continue to increase in numbers, and press most detrimentally on the springs of industry. With the magnificent crown colonies of Britain at disposal, I cannot but consider it a disgrace to the age that the country should be systematically eaten up by a superfluous population. We must, however, talk of this some other time. Good-night.

NARRATIVE OF THE ASCENT OF MOUNT ETNA.

It was in the afternoon of the 26th of April 1844, that, mounted on mules and horses, we left Catania for Nicolosi, intending to take guides from that place for the ascent of Mount Etna. April, it should be observed, is too early in the year for the excursion; the best time for which is on or about the full of the moon, in the months of June, July, or August. Our expedition promised to be difficult, as we could see that a great quantity of snow lay on the mountain. But these things cannot always be perfectly timed, and as no obstacle lay in our way beyond the prospect of a little additional fatigue, off we set, on a day that held out to us every appearance of the most beautiful weather. Our party, at starting, consisted of Mr A—, Mr B—, myself, two muleteers, and a boy. We were afterwards joined by Mr C— and his muleteer. Here Mr A—'s mule made a most vicious attack, with teeth and heels, on the mule of Mr C—. Bites and kicks were exchanged, unpleasant even to witness; however, the animals were quieted without accident. And so, in peace and harmony, we reached Nicolosi in less than three hours after leaving Catania. Nicolosi is said to be more than two thousand feet above Catania, and ten miles distant.

Here we remained until about half-past eight o'clock, when we sallied forth to continue our journey up the mountain, our party being augmented in number by two guides, mounted like ourselves. We set off in high spirits, for the night was most beautiful—clear, warm, and quite calm—with a fine moon, but only about a week old; by the light of which, however, we could distinguish the as yet distant summit of the mountain, with the smoke issuing from the crater now and then tinged with flame.

Leaving the Monte Rosso on the left—one of the very numerous minor volcanos about the base of Etna—we proceeded up a tedious way, consisting of ashes, scorie, and rough hard lava; whilst the muleteers occasionally awakened the echoes of the Etnean solitudes with their wild chants. It was not very long before we came to the woody region of the mountain, and at about eleven o'clock we arrived at a hut in the upper part of it,

called by the appropriate name of the Casa del Bosco. By this time we all began to feel the cold of the night very sharply; and I shall never forget the genuine delight with which we beheld a bright fire, which the guides made for us in the centre of the lava-built Casa, blazing up to the very roof. Fuel there was here in plenty; the floor, however, was the earth; and the only furniture some stones, disgorged probably by the mountain in some ancient eruption; stretched on which, however, after getting thoroughly warm, some of us enjoyed half an hour's sound sleep.

At about midnight we left the Casa del Bosco, still mounted, and proceeded upwards and upwards, always by a similar kind of path. Not long after we left the Casa del Bosco, the moonlight began to fail us, and we had to pass under a wall or low cliff of lava, the shadow of which kept the path in darkness, whilst the almost setting moon shone horizontally in our faces. Just here we came to a part of the road difficult to pass, and the rider preceding me stopped, and said he could neither see his way nor go on. He, however, soon managed to surmount the obstacle, which may be described as a steep broken step in the lava rock. I then took my turn; but my horse, after getting his fore-feet upon the impediment, seemed to make no further effort, but let himself slip backwards on his haunches against the mule behind me, which, in his turn, recoiled against the next, and an accident seemed inevitable. I dismounted; and after some dangerous floundering and plunges on the sharp lava, my poor steed lay quite still, with his hind-legs tucked close under him, evidently in the greatest terror. I walked a little farther up the ascent, whilst the guides were occupied with the poor beast. They soon got him on his legs, and brought him to me; and I mounted, and we proceeded as before. The road continued more or less beset with similar obstacles, and the moon soon afterwards went down; but the night was so fine and calm, and the stars so brilliant, that we did very well as to light. However, as we were once more stopped by some impediment similar to the last I have mentioned, A——'s mule seized that tempting opportunity to fly at one of the others, and a regular combat, as it seemed in the imperfect light, took place between the animals, to the imminent peril of the riders. I heard some sound kicks given and received, and saw indistinctly A——'s vicious brute twisting violently round and round on his hind-legs, close to the edge of a black precipice, which in the obscurity looked bottomless. It was really a frightful sight. But these things, as they occur suddenly, so they are, one way or another, terminated quickly. Most happily no harm ensued, and we all continued our route as before.

Soon after this we reached the snow, which lay in wide patches in the hollows of the lava and ashes. We crossed several of these snow-fields without accident; but on the next, the mule of the foremost of my companions fell, one leg having broken through the frozen surface of the snow, and my horse suddenly slipped down very disagreeably close to the sharp edge of the lava. I dismounted for the second time, and was quite astonished to find what a slippery state the snow was in. On alighting on my feet, I fell down immediately; and on attempting to recover my legs, slid rapidly backwards, until I was brought up, in nautical phrase, by coming in contact with some one of the party behind. However, we remounted, and continued our progress upwards.

At last we came to a place differing little in appearance from other places that we had passed, where, however, the guides decided that we must leave the mules and horses. Accordingly, we resigned them to the charge of the muleteers, who returned with them to the Casa del Bosco, there to wait for us on our descent. The guides furnished us with sharp-pointed sticks, cut in the woody region of the mountain, and we set forward on foot. Our way lay over an apparently interminable succession of slopes of frozen snow, rugged,

and at the same time excessively slippery, and I believe we all found them painfully toilsome to ascend. For my own part, I often fell, and slid back several yards, and had all the work to do over again; so that in a short time I began to feel so much fatigued, that I was several times forced to stop, and lie down on the snow; and in this way I proceeded until we reached the Casa Inglese. The Casa Inglese is a small hut, nearly ten thousand feet above the sea, erected for the accommodation of persons ascending Etna; but it was not possible to enter it, as the snow around it quite blocked up the door, and was as high as the eaves of the building. It is usual, in making the ascent at the most favourable season of the year, to ride thus far, which of course renders the excursion much less fatiguing.

Beyond the Casa Inglese, though the dark mass of the cone of the mountain lay right before me, and apparently quite near, yet the slopes of snow continued to rise up, one after another, as if by magic. We were now approaching an altitude of ten thousand feet, and I began to experience the effect of the rarefaction of the air. I felt no distressing symptoms whatever in the chest, but a violent throbbing in the head came on, still without pain. As soon as I ceased walking, it seemed to become, as it were, distinctly audible, resembling a loud and regular hammering at ten or twelve yards' distance; but after I had rested a few seconds, it entirely subsided. And in this way I proceeded slowly, until the snow was indeed all past, and the base of the cone, on which the snow does not lie, was fairly attained.

My companions, who had started from the place where we had left our mules at a pace which I could not keep up with, had by this time left me considerably behind, but not so far as to prevent our two guides one of whom remained with me, from calling to one another. My guide was here hailed by the foremost, to say that one of my companions was tired, and had sat down to wait for us to come up with him. However, in a few minutes, as I afterwards learnt, he went on, and we did not rejoin him until we reached the summit.

We now began to ascend the cone. Our old enemy the snow had now entirely disappeared; for the steepness, the nature of the soil, and in many places the superficial heat of the cone, is such as not to allow snow to lie upon it; but the acclivity is beset with a host of its own peculiar difficulties. We commenced our climb, for it could be called nothing else, by a circuitous route, over very hard and very steep volcanic rock, covered with loose stones of all sizes. Here I got many falls, and once slid several yards down the side of the mountain. On comparing notes afterwards, I found that my companions had all had falls about this part of the ascent. The day now began to break; and among other remarkable volcanic features, we distinguished, far beneath us, the stream of lava which broke out in the lower part of the mountain, and so nearly overwhelmed the town of Brontè last December [1843]. Soon afterwards, at twenty minutes before five o'clock, I found, to my infinite satisfaction, that I had attained the edge of the crater, along which, but still with a considerable ascent, amidst thick drifting sulphureous vapours, we continued to walk to the highest point of the summit of the mountain, which is 10,872 feet above the level of the sea. Here I rejoined my companions, two of whom, with their guide, were already settling themselves to sleep in the warm ashes. I walked on along a narrow ledge, composed of very frail materials, to the farthest accessible point, whence, before me, I saw the disk of the rising sun, and far beneath Taormina, Messina, with the volcanic islands, and amongst them Stromboli in the distance, together with the whole line of coast, and the expanse of sea; whilst close on my right, enormous volumes of smoke, now illuminated with splendid sunlight effects, and now tinged with the fires of the crater beneath, rolled furiously away to the leeward; whilst on the left, I saw another part of the crater irregularly divided into fearful valleys and

hollows, issuing from which we heard continual explosions, as of artillery, each explosion being unfailingly succeeded by the harsh clatter of the fragments that had been hurled upwards, as they fell back upon the rocks. Even when on the spot, it is not an easy matter to obtain a distinct idea of the summit of Etna; that is to say, on the supposition of circumstances being nearly the same as we found them in that locality. The smoke and vapours shut out a great part of the view, and the faculties are liable to bewilderment on witnessing violence and confusion not ordinarily connected with the operations of nature. The real character of the weather was perfectly calm and serene; but even under the most favourable circumstances, in this region of terror, everything partakes of the character of furnace and storm; and at this elevation, aided in all probability by the operation of the volcano itself, the air drew away pretty strongly from the north, with a piercing effect of cold hardly to be resisted. We stood on a frail narrow ledge, and three several times we felt shocks of earthquake. The summit of Etna is indeed a dreadful place!

We soon all reassembled, and got together, out of the wind, just below the edge of the outer slope of the cone, supporting ourselves on the steep by thrusting our heels into the loose ashes, the warmth of which we found inexpressibly grateful.

I have already described the sensations I experienced during the ascent. Another of the party suffered greatly with pain in the chest; and another, when on the summit, vomited; but he would not allow his indisposition to be caused by anything excepting the stench of the sulphureous vapours.

At Catania, I had protested against making the ascent during the night; being an avowed unbeliever in the beauty of sunrises as seen from mountain-tops; and, for tolerably obvious reasons, preferring the illumination of mid-day, when there is anything new or strange to be seen; but I was out-voted; and I now think that, on the whole, for local and other reasons that need not be recapitulated here, we did well to ascend the mountain at night. Besides, we had observed that, at about ten in the forenoon, a cloud generally settled for the day on the summit, making it advisable to reach it very early in the morning. However, the day we fixed upon for our expedition was fine throughout; but not so the day before, nor the day after.

As I had anticipated, notwithstanding the fineness of the weather, the sight of the sunrise proved a failure. I had heard much of the general magnificence of the spectacle, as well as of the extraordinary effect of the projection of the dark shadow of the cone of the mountain over the face of the country; but I saw nothing connected with these particulars the least worthy of remark. During the ascent, however, in the night, the circumstances attending the view of the sidereal heavens far exceeded my expectations. The splendour of the constellations outshone anything of the kind I had ever before witnessed or even imagined. The Milky Way lost its uncertain nebulous character; at least it put on the appearance of a luminous cloud, perfectly well-defined in outline; and I do not assert it as a fact, but I verily believe that, by its light, and by the general light of the stars, I saw my own shadow on the snow. It was, in truth, a glorious spectacle, to which no words of mine can do justice, and of which I cannot imagine I am conveying any adequate idea. As Etna has no lofty mountains near it, the stellar horizon had the appearance of being far below us; we had, in fact, more than an entire hemisphere to gaze upon; and I saw some fine stars rise from, and others set within, the black abyss beneath us. The rising of the planet Jupiter, early in the morning, was in this respect a very beautiful phenomenon. I saw also, in the course of the night, two faint flashes of lightning in the cloudless darkness far below us; and in the sky above, two, and only two, excessively faint meteors. The morning twilight appeared of very brief duration.

On the summit, we found the sulphureous vapours very overpowering; and after remaining there about an hour, we began the descent of the mountain, not the way by which we had ascended, but directly down the sheer declivity of the cone, which lay beneath our feet, where we had all been reposing. From its extreme steepness, it at first seemed impracticable: but one of the guides led the way quickly and decidedly; and we soon found that it afforded us a very rapid, and a comparatively easy path; for it consisted for the most part of fine ashes, into which we sank more than ankle-deep at every step, without the possibility of slipping; but now and then the ashes ended abruptly, giving place to a steep face of hard sulphureous rock, covered with loose stones; and wherever this occurred, you were tolerably certain of a smart fall. This path soon brought us down to the slopes of snow that, in the ascent, I had found so formidable; and to my surprise, I descended them without difficulty, and kept well up with my companions.

We now diverged to the left, in order to obtain a view of the famous Val del Bove, as it is called, an enormous desolate ravine or valley, high up in the mountain, presenting every variety of the most awful volcanic scenery. It is, I believe I am justified in saying, much the finest thing in the whole region of Etna. Although no colouring could have been anticipated in such a scene, yet the varieties, and those chiefly varieties of black, were quite astonishing. Effects, too, of light and shade abounded; and the transparent air and bright morning sun cast a singular velvet-like softness of tint over the lava streams, with now and then a tinge of the most delicate purple imaginable—

—'Smoothing the raven-down
Of darkness till it smiled.'

We were, in truth, most fortunate in obtaining so perfect and enjoyable a view of this tremendous valley; often for months together the abode of aerial clouds and tempests, even when unweaved by volcanic storm.

We continued our route down the patches of snow, until we once more entered upon the woody region; and at about nine o'clock regained the Casa del Bosco, where we found our muleteers fast asleep in the sun. After a short delay we remounted, and as we had a fatiguing night walk of about eight hours, we were not sorry at the prospect of riding down to Nicolosi. In this part of the woody region I was much pleased at hearing the cuckoo: it was the first I had heard this year; and the first I recollect to have ever heard out of England.

We had now a better opportunity of observing the woody region than when we passed it in the night. I confess I was disappointed in the beauty of it, at least of that part of it which we crossed. Within sight were some terrific standing cascades of lava, that had in former eruptions desolated many localities of the region. We also enjoyed an excellent view of the very numerous minor volcanoes that have at various times broken out in the lower regions of the mountain. They are all now extinct, but they have generally proved very destructive. Some of them, the Monte Rosso, for instance, are hills of considerable elevation. We also saw the celebrated Grotto del Capre, which we had passed in the night. It is an insignificant cave, not far from the Casa del Bosco, and was once the only refuge for travellers ascending the mountain. Many names of travellers are carved on the surrounding trees. I was disappointed at finding that the chestnut-tree, called, from its great size, 'De Cento Cavalli,' did not lie in this part of Etna. It must be visited in a distinct excursion from Nicolosi.

Passing from the woody region through the desolation of lavas of various dates, and over a long tract of the black pulverised ashes of the Monte Rosso, we at length reached Nicolosi. Here we dismissed our guides, and obtained some refreshment; and in about two hours more remounted, in order to ride quietly back to Ca-

tania. But our scrambles were not yet over. Just as we were leaving the place, the vicious mule managed once more to fly like a tiger at one of the others; a fresh kicking and plunging ensued, which broke A—'s girths, and down he fell on his back, with his saddle between his legs, on the sharp stones of the steep-paved village street which we were descending. But, for to-day at least, we seemed one and all of us invulnerable. A— remounted, unhurt, and we continued our ride to Catania, where we arrived between three and four o'clock, having been absent about twenty-three hours; and considering the season of the year, we could not but be satisfied with the success of our ascent of Mount Etna.

In the evening we had the honour of a visit from Professor Forbes of Edinburgh. He had just arrived at Catania, and hearing we had ascended the mountain, came to make some inquiries respecting our expedition.

AN ENTERPRISING BRAHMIN.

THE following account of a distinguished Hindoo, from the much-esteemed Serampore Journal, 'The Friend of India,' throws an interesting light upon the progress of enlightenment in India, and the various agencies that are at work in the great cause. Hitherto we have heard only of Europeans, and natives who, whether embracing Christianity or not, had abjured the superstitions of their country; but the subject of this memoir clung to the last to the Brahminical faith; and yet—while rising by talent and industry from the humblest station to immense wealth—placed himself habitually at the head of every project for the advancement of his co-religionists in knowledge and civilisation.

Of the native gentlemen who have raised themselves to eminence in the native society of Calcutta, by the acquisition and distribution of wealth, within the present century, Ram Komul Sen will be freely acknowledged as the most remarkable. Others have risen from equal obscurity to greater wealth, but none have been distinguished for their intellectual attainments. Bishanath Mooteeah, lately the dewan of the Salt Gohala, began life with eight rupees a-month, and is generally understood to have amassed twelve or fifteen lakhs of rupees before he was required to relinquish his office. The father of Baboo Asootosh Deb, the founder of that wealthy family, served a native master at five rupees a-month before he became a clerk in the late firm of Fairlie, Fergusson, and Company, in whose employ, and also in that of the American merchants—who named one of their ships after him, *Ramdolal Dey*—he accumulated a colossal fortune. The present dictator in the money market, the Rothchild of Calcutta, Mootee Baboo, began his career with the humble salary of ten rupees a-month. Ram Komul Sen also was the architect of his own fortune, and began life as a compositor in Dr Hunter's Hindoostanee press, at eight rupees a-month; and though he is said to have bequeathed a smaller sum to his family than the accumulations of any of the native gentlemen we have mentioned (so report carries his fortune beyond ten lakhs), yet he has attained a more solid renown, from his connection with the progress of knowledge and civilisation among his own countrymen, of which he was one of the most strenuous and distinguished promoters. He did not long continue in the subordinate situation of a compositor in the printing-office. He attracted the notice of Dr Wilson, now professor of Sanscrit in the university of Oxford, who discovered his natural abilities and his thirst for knowledge, and took every opportunity of bringing him forward. His first promotion, we believe, was to some subordinate situation on the establishment of the Asiatic Society, which introduced him to the notice of some of the most distinguished members of European society. He had early applied with diligence to the acquisition of English, which he spoke with considerable fluency. At the time we allude to, a good colloquial knowledge of English was rare, and the possession of it was a sure passport to distinction.

Ram Komul Sen soon came to be recognised as a leading man in the small band of enlightened natives in Calcutta. On the establishment of the Calcutta School-Book Society, he was placed on its committee, and materially assisted its operations by the compilation and translation of several useful works. When the Hindoo college was set on foot the year after, the organisation of it was in a great measure intrusted to him through the recommendation of his constant patron, Dr Wilson. Here he had an opportunity of indulging his ardour for the spread of knowledge among his own countrymen, and of exhibiting his natural aptitude for managing the complicated details of business. His position in this institution materially improved his standing in native society, and laid the foundation of that influence which he subsequently acquired. Three years after the establishment of the Hindoo college, he projected the publication of an English and Bengalee dictionary, in conjunction with Mr Felix Carey, the eldest son of Dr Carey; but his death in 1822, before a hundred pages of the work were printed, suspended its further progress. It was, we believe, soon after this undertaking that Ram Komul Sen was placed at the head of the native establishment of the Mint, by Dr Wilson, the assay master. This highly responsible and lucrative appointment raised him to great distinction, and his mansion in Colootolah became the resort of the wealthy and the learned, and the fame of his greatness was spread far and wide through Bengal. In 1830 he resumed the project of the dictionary, and with great personal labour completed the undertaking, and carried through the press a quarto volume of seven hundred pages. It is by far the fullest and most valuable work of its kind which we possess, and will be the most lasting monument of his industry, zeal, and erudition. It is probably the work by which his name will be best recognised by posterity.

After the departure of Dr Wilson to England, he quitted the service of government, and accepted the office of native treasurer of the bank. Some months back his constitution began to exhibit symptoms of that decay, which had been accelerated, we have no doubt, by the extraordinary personal labour to which he submitted, and which had been one of the main instruments of his elevation; and he expired at his family residence in the country, opposite the town of Hooghley.

There is scarcely a public institution in Calcutta of which he was not a member, and which he did not endeavour to advance by his individual exertions. He was on the committee of papers of the Asiatic Society; he was a vice-president of the Agricultural Society; he was one of the committee of the Calcutta School-Book Society; he was a manager of the Hindoo College. He was equally honoured in the European and native community, and had long been considered as one of the most eminent and influential natives of the metropolis. Though he continued through life to maintain the principles of a rigid, and in some respects of a bigotted, Hindoo—for he was never in advance of his own creed—to him belongs the great merit of having taken a leading part in the efforts which were made for the diffusion of knowledge among his own countrymen at the period when Lord Hastings, for the first time, repudiated the idea that the ignorance of the people was the firmest safeguard of our empire. He was one of the chief instruments in the establishment of those institutions which have diffused European science among the natives, and so greatly raised the tone of native society.

THE FUTURE.

Those who have seen dearth and famine disappear at the bidding of an improved agriculture—the plague driven from our cities, and the ague from our counties, by the advance of civilisation and the appliances of science—will not despair of the time when typhus and scrofula, which desolate the town, and the intermitting fevers, which still linger in the country, will yield before the advance of that knowledge which is now dawning on our social horizon.—*Lecture on the Unhealthiness of Towns, &c. by R. D. Grainger, Esq.*

LITERARY BLUNDERS.

WHEN Boileau published his translation of 'Longinus on the Sublime,' he was taken for a profound chemist, and the admirer congratulated him on his great treatise *du sublimé*.

In Pope's notes on 'Measure for Measure,' he informs us that the story is taken from the novels of Cinthio, dec. 8, nov. 5—meaning the eighth decade, and the fifth novel. Warburton, in his edition, thinks fit to fill out these abbreviations; and we accordingly read, December 8, November 5.

As great an error is made by Gail in the bibliographical index to his edition of Anacreon. A catalogue of reprints, which served as part of his materials, contained these abbreviations—*e. bro.* (*exemplaire broché*, or stitched copy), which the unlucky editor mistook for the name of a place, and accordingly set down the work as printed at *Ebro*.

Budeus took the Utopia of Sir Thomas More for a real country, and seriously proposed to send thither missionaries. D'Israeli tells us that the Travels of Gulliver gulled a good many for a long time after their publication. Holberg, a Norwegian author of the last century, published a satirical romance, which he entitled, 'The Subterranean Travels of Nic. Klim;' and this erudite work is quoted by a German writer in support of his geological theory. The fall of the roof of the New Brunswick theatre in London, some years ago, was described in a tale called 'Narrative of John Williams,' published in a then existing periodical, the Weekly Review, which, although full of imaginary circumstances, is still cited as an authority on the subject. The editor of a Hereford paper—the hero of the story having been bestowed upon that city—inserted a violent leader, assuring the public that certain statements were entirely false; that, after the most minute inquiry, it could now be unhesitatingly declared that no such person as John Williams had ever resided there.

'The Triumph of the Green Lover,' by J. Lemaire, a poet of the sixteenth century, comprised in two epistles, and dedicated to Margaret of Austria, daughter of the Emperor Maximilian, gives rise to this criticism in the Bibliothèque Française:—'I do not see why the author should have taken the surname of the Green Lover, unless it be on account of the green colour of his costume, of which he gives a long description; while his mistress, the Princess of Austria, had a predilection for black, as more suitable to the unhappy fortune which had pursued her through life. The first epistle answers completely to the title of lover assumed by the author; and Lemaire does not shrink from boasting of the familiar terms on which he lived with a princess. The surprising thing is, that he should not merely have addressed her in such a style, but that he should have expected her to derive pleasure from the fact of his having done so being announced to the public in his work. He states, indeed, that he was born in Upper Ethiopia, but it is easy to see that this is a fiction.' This grave criticism is by the Abbé Goujet, who had not read the work he examined with sufficient attention to perceive that the Green Lover was a parrot.

BABY TRADE OPENED.

THE following appears in the Athenæum of February 13:—

'To ladies without children, and others, a very promising and genteel little boy, five years old, and without parents, requires a permanent home, where he would be educated and brought up with kindness and motherly affection. Address, with particulars of family, &c. to A. N., Post-Office, Great Russell Street. Terms expected, about L.10, 10s.

'So the baby trade is to be opened! and following the law of competition—as the Great Shovel trieth to pull down the Small Coal-box by publishing its scale of prices—we may look shortly to read of "very promising little boys" purchasable at five pounds, girls for less, and twins—like "family tickets"—on a reduced scale of prices. It has been long a fact well known in St Giles's, that "the children of the mobility" were movable—could be hired by the day, as well as a sore eye or a lame leg, or the properties of epilepsy! But the Huggins and Muggins market is now about to be invaded by "the genteel;" and to judge from the extreme moderation of the terms, "the operation" is intended to be extensive. There will be next, we apprehend, a joint-stock company for the sale and exchange of old people!'

We confess we cannot participate with our respected contemporary in the drollery of offering children in the manner of the advertiser. The only reprehensible thing about the

advertisement is asking money for the boy, which gives an air of *selling* to the transaction. Apart from this, we can see nothing wrong in seeking a permanent home for a destitute orphan child. At present, vast numbers of wealthy individuals who have no children of their own, might possibly be induced to adopt and rear orphans, not only from motives of benevolence, but in order to possess an object on which they could lavish their affections. And how much more gracious and becoming would such acts of adoption and nurture be, than the practice of keeping and pampering parrots, lapdogs, and other perishable creatures! On the whole, therefore, eccentric in principle as it may appear, we would be glad to see a 'baby trade' of this kind opened. We should be happy to see the rich, who do not very well know what to do with their time or their money, lending a hand to bring up those who, in the providence of God, have been thrown on the compassion of their fellow-creatures—and that not by merely subscribing sums to founding hospitals, and such-like, but by actual domestication and personal superintendence.

While on this subject, we would refer to what in Paris appeared to us a fine trait of benevolence. It is customary in the French capital for pious individuals to visit the prisons for young criminals, and there select and attach themselves to a child who has been brought into a course of vice by reason of parental loss or abandonment. Having made his selection, the visitor calls at regular periods to talk with and instruct his young protégé; and when the period of imprisonment expires, he places him to a trade, sees him properly domesticated, and otherwise concerns himself in his welfare. By this means great numbers of children are reclaimed, and made good members of society. I was told of instances of extraordinary affection having sprung up between adopters and adopted; and also of the great pleasure which was often experienced from the consciousness of having saved interesting youths from destruction. Might not much of the speculative piety of England assume advantageously this practical form?

ON THE DEATH OF AN INFANT.

SWEET floweret! blighted by the winter's blast,
The tribute of a verse I'll give to thee:
Thy struggle's o'er, thy every trial past,
Thou first reft blossom from the parent tree.
The world will heed thee not, my innocent!
A babe has lived—a few short days—and died;
Yet in thy mother's yearning heart were pent
Years for the days she had thee by her side.
The dim futurity she scanned with joy;
Each period of thy life she had her trust,
Was bright with hope and promise for her boy;
Alas! the vision's buried in the dust.
But not: the grave to thee new life has given,
And hopes that sprang on earth now bloom in heaven!

February 1847.

B.

• CURRY.

I cannot help regretting that the people of England, who possess so many excellent dishes, some national, and others borrowed from their Gallic neighbours, should envy us poor Indians our single tolerable dish, and attempt to libel it, as they do, by giving its title to a strange, wild composition, formed by throwing a little dust from a red packet, decorated with gilt hieroglyphics, into a dish of hashed fowl, and giving to the same the brevet rank of 'curry.' Now, curry is an artfully-composed dish, depending for its excellence on its flavour, not on its power of excoxiating the human tongue by a wicked deception under the form of pleasant nourishment; and to obtain this, all the ingredients, some sixteen in number, must be fresh grown and fresh ground. Happily, however, an Indian cook effects this under circumstances in which an English servant would let his master starve; but give a native of India but a bit of level ground, or the plank of a boat, where he may make a fire, and provide him with a cooking vessel, a bit of ignited charcoal, a chicken, and a stove, and in half an hour he produces a good dinner; the chicken being denuded of its feathers after execution by a dip in scalding water, while the 'curry stuff' is ground upon the stone.—*Asiatic Journal*.

GAIETY AND GLOOM.

Among the passengers on board a steamer which one morning left Dover for Calais, was a young Englishman of somewhat fashionable appearance, who seemed to shun as far as possible all contact with his fellow-travellers: wrapped up in mysterious silence, he proceeded, on landing, by the first diligence which departed for Paris. All we have to say concerns this young gentleman, and we may as well tell his history at once.

Frank Marlow was the son of a respectable London merchant, who had given him an education at Eton, which fully qualified him in that very easy art—the art of spending. To do justice to Frank Marlow, he took very kindly to this piece of ingenuity. In little more than two years after the old gentleman's death, he had got through his handsome patrimony; a mere wreck was all that remained; and here he was, a self-exiled man, seeking for oblivion in the obscurities of Paris.

Like most persons who have gone through a fortune, Frank was full of terrible notions about the rapacity of mankind. He had been cruelly used by his so-called friends. The world was all a mass of deceit. 'Vanity of vanities, all is vanity,' was his song, and a very appropriate song too, for all exhausted prodigals to sing. Frank, at eight-and-twenty, was a gloomy misanthrope, a hater of everybody; though there was only one man on the wide earth whom he should have despised, and that was himself.

Frank sought oblivion. He wanted to live no one knew where; and the more obscurely he could hide himself, he thought he should be the happier. Several lodgings were tried in Paris, but they proved too garish and cheerful. In one house he heard the sound of a fagoelet, which was enough. Horrid, deceitful villains—all bad people are merry! At length he fell upon a lodging quite to his fancy. It was on a fourth floor of a tall old-fashioned building—so exceedingly tall and narrow, that it seemed as if it had been squeezed out of shape by the houses which leant upon it. This uncomfortable-looking tenement was situated in a dull, narrow street, into which very little sun ever shone. It had the air of a great, long grave; just the kind of abode for people who take a fancy to be miserable.

Satisfactory as the new lodging was in many respects, a day or two's experience showed the morose young Englishman that, if he wanted to be perfectly beyond the reach of gaiety, Paris was the worst place in the world to which he could have come. The landlady, Madame Bernard, was an exceedingly merry, sweet-tempered person. As the wife of an operative locksmith, who did not enjoy good health, the mother of several children, the protector of a poor orphan niece, Adèle, and the mistress of a very limited accommodation, she may be supposed to have had some tolerable

reasons for being careworn; but not all these things, nor the gloomy, gravelike street in which she lived, could force a sigh from her bosom. She was always as bright as a streak of sunshine. While toiling in her little den of a kitchen, whose only light was that of a sepulchral-looking lamp, the Frenchwoman was as blithe as any uncaged lark.

It was perhaps because Frank did not see much of this gaiety that he did not feel seriously distressed about it. His interviews with madame were few and short. Her principal visit was to kindle his fire, and serve his coffee in the morning; and on such occasions she used to launch out a little in the way of gossip, believing, kind soul, that monsieur had some secret grief which needed to be assuaged by conversation. Among other subjects on which she expatiated was that of neighbours—a fruitful one to landladies all the world over. In spite of himself, Frank found that Madame Bernard's gossip was worth listening to, for it gave a sort of insight into human nature.

First on the good dame's list came a mysterious couple, Monsieur and Madame Dezille, who seemed to live in a pinched kind of way. Madame was a tall, pale, melancholy-looking woman, who appeared to carry in her mind some ponderous secret, and was always embroidering purses. Her husband was a comical-looking little man, who was never seen but in a long greatcoat, that fell down to his heels. The most incomprehensible thing about him, however, was his practice of remaining at home all day, and his going out at night, and never returning till past two in the morning, to the great wrath of the portress, who, out of pure spite, averred that he was a *mouchard*, or secret spy of the police. She even once called him so to his face; but Monsieur Dezille, far from making any contradictory reply calculated to enlighten her on the subject, listened to her with provoking complacency, and quietly bidding her good-morning, walked up stairs.

The great secret at length came out. It was discovered, to the satisfaction of the portress and her lodgers, that Monsieur Dezille repaired every evening to a public ball behind the Palais Royal, where his office consisted in taking care of the canes and umbrellas belonging to the dancers, for which dignified occupation he received the munificent salary of sixty francs (about £2, 8s.) a-month, as long as the ball was open—that is to say, during the winter season only. How he and his wife lived throughout the remainder of the year, was more than any one could tell. From the moment that these circumstances were known to them, the portress and lodgers ceased to interest themselves any further in the fate of the humble pair; but Marlow observed—and the trait impressed him with a favourable opinion of her character—that whereas Madame Bernard had formerly looked with a suspicious eye on her neigh-

bours, she now no sooner knew them to be honest, though poor, than she immediately gave them tokens of her good-will, by numerous little attentions she had formerly neglected to pay.

Somehow or other—perhaps because they instinctively saw the truth and simplicity of her character—the shy and proud couple grew more condescending; and though evidently superior, in education at least, to the locksmith and his wife, they freely conversed with them, until they at last came to be on very amicable terms together. And then, but not till then, did Madame Dezille confide to her simple, good-natured friend the secret which weighed on her soul. 'Monsieur Dezille'—she scorned the vulgar term of husband—'was not merely what he seemed to be: he was more—he was a poet and an author.' Madame Bernard heard with silent awe. 'Like that of other great men, his life had been a perfect romance. He was the godson of a reigning potentate—a German one,' added Madame Dezille with strong emphasis, 'whose valet his father had been for many years whilst he was exiled in France by his rebellious subjects.'

Then followed a thrilling narrative of persecutions, imprisonments in deep dungeons, and hairbreadth escapes over high castle walls, all of which had been endured and effected by Monsieur Dezille in foreign lands, through the enmity of his unnatural godfather, whom he had unluckily offended; until, after innumerable difficulties, he succeeded in reaching his native country, where, like another Othello, he won his *Desdemona* by the history of the sufferings his youth had undergone. All this Madame Bernard, good, simple soul, heard with reverent belief. Indeed it is very probable that it was almost all true; and far from diminishing or abridging the narrative, which she the very next day repeated to Marlow, she rather increased its bulk by a few additional embellishments of her own, which she very innocently and unconsciously bestowed on Monsieur Dezille's adventures.

The occupier of the third apartment on the landing was a morose, surly old bachelor, named Ricord, whom everybody disliked—even the kind Madame Bernard, if indeed she ever disliked anybody—and who played on an old fiddle, as cross and croaking as himself. It was some time before Marlow discovered this circumstance; and even when it became known to him, he was reconciled to it by the character of the musician, which, as described by Madame Bernard, who had learned it from the portress, was anything but cheerful or lively.

Several months passed away, during which Marlow, whose only amusement was listening to Madame Bernard's morning conversation, felt very dull, yet nevertheless persisted in his misanthropic mode of existence. One cold winter's day, when he was as usual poring over the '*Journal des Débats*,' and occasionally listening to his landlady, he gradually drew away his attention from the newspaper to bestow it on Madame Bernard. She was talking of Monsieur and Madame Dezille with more than customary animation.

'Yes, sir,' she continued, for she had been speaking for some time, 'I met Madame Dezille on the stairs last night, and she told me everything about it. Monsieur Dezille has just finished a *superbe* comedy, all about kings and queens. Monsieur, addressing Marlow, 'has heard, I suppose, that his father was valet to a German sovereign, so that he of course knows everything about these great people; and his godfather, with all the princes and princesses, are to be in it; and when it is acted, it will create little less than a revolution in Germany; for Madame Dezille says, that when he read it to her, it made her hair stand all on end, it was so awful. But what shows, moreover, that it is certainly a good comedy, is, that Monsieur Dezille, after treating all his friends and comrades of the ball-room where he goes in the evening, read it to them, and could scarcely go on with it for their applause. Indeed they all to a man declared that the director of the *Theatre Français* would be astonished to hear it; that it would be one of

the fine plays of the classic boards; and so delighted were they, and so heartily did they drink his health, that Madame Dezille, poor woman, sighed and turned up her eyes whilst she was telling me about it. So I spoke to Bernard this morning, and we agreed to ask Monsieur and Madame Dezille to come and spend the evening with us, and be merry. We shall have some cider, with roasted chestnuts and pancakes, and Monsieur Dezille has promised to read his comedy. Perhaps,' continued Madame Bernard with an insinuating smile, 'monsieur would like to hear the comedy? I am sure we should be very happy—' But here the gloom that suddenly gathered over Marlow's features as she spoke, warned her that this was dangerous ground, so, correcting herself, she hastily added, 'But I suppose monsieur does not much care about such things?'

It was not, however, at her presumption that Marlow felt incensed; he had too much good sense to take in ill part an offer he knew to be kindly meant; but his misanthropical notions were terribly shocked to perceive that his landlady and her husband—a locksmith too—were going to indulge themselves in a party, one of those dangerous and pernicious amusements which had ruined him, 'and will ruin many more,' he bitterly thought, 'whilst the love of luxury and ostentation are to be found upon earth. Ay,' he continued in a thoughtful mood, 'I see it all even now: these people are as credulous and simple as their neighbours are knowing and selfish; they will allow themselves to be duped and flattered; the parties will be renewed, always of course at their expense, until they have nothing more to bestow. They will then be laughed at for their pains; the husband, disgusted with his comfortless home and his wife's ill temper, will become a drunkard; and as for the poor children, beggary and starvation await them.'

'Will monsieur be at home this evening?' inquired the cheerful voice of Madame Bernard.

'No; I am going out for the day,' abruptly replied Marlow.

'Must I keep monsieur's fire in?' she continued with unalterable good-humour.

This time Marlow answered in a milder tone, that she need not take the trouble, as he would not come home till late in the evening.

The day was fine and frosty, so our hero immediately sallied out, fully determined not to return until Monsieur and Madame Dezille and the comedy were all fairly despatched. He took a long walk; but as, after all, the day was not yet half spent, he resolved to call upon the only acquaintance he had formed in Paris. His friend lived far away; Marlow did not reach his dwelling till dusk, and, as ill luck would have it, did not find him within. In a rather sulky mood, he now resolved to go home; but, as though to increase his ill-humour, there came on a thaw, accompanied with a drizzling rain, which promised to last for the whole evening. He was unprovided with an umbrella, and could not find a single cab or omnibus until he was within five minutes' walk of the street in which he resided. It was nine o'clock when he reached his *quatrième étage*, thoroughly tired, drenched to the skin, and, above all, highly irritated against his landlady, to whose unlucky party he ascribed his mishap.

As he usually left his key in Madame Bernard's keeping, he was now obliged to knock at her door in order to procure it from her. No sooner had he reached the landing, than the sounds of several voices within, mingling with occasional bursts of laughter and applause, greeted his ear. As his summons had evidently not been heard or heeded, Marlow, without further ceremony, entered the kitchen, and called out for Madame Bernard; but the good dame, who was busy frying pancakes over the stove—which was so contrived that any such simple cookery could easily be effected through its means—apparently did not hear him, for she made no reply. Marlow impatiently advanced, but passed when he reached the glass-door, for he felt unwilling

to enter the dining-room, where all the party were assembled; and, notwithstanding his ill-humour, he was not quite averse to obtain a cursory view of Madame Bernard's guests. Owing to her accurate description, he soon recognised every one of them.

With the exception of Madame Bernard herself, and of her niece and the children, who were busy roasting chestnuts, they were all seated round the table, on which stood an old-fashioned lamp, which shed its light around, and enabled Marlow to take a full view of their countenances. In the most comfortable and easy-chair, near the warm stove, sat his old crabbed neighbour of the fiddle, whom he had met once or twice on the staircase. He could at first scarcely believe his eyes, and thought it must be some error of his; but a strangely-fashioned and antiquated-looking instrument, which lay on the table, fully confirmed the fact. Madame Dezille, who sat next to him, was as usual embroidering a purse; whilst her husband, the man of the comedy, with bent brow and fierce aspect, read something from a manuscript before him; and to enforce or illustrate his meaning, occasionally struck his clenched fist on the table, making the wine-glasses and the old fiddle itself ring again. The locksmith, good man, listened with much gravity and awe; and when he succeeded in catching Monsieur Dezille's eye, and saw that it was the proper time for him to do so, applauded with all his might. Marlow listened in the hopes of catching something; but what between the hissing of Madame Bernard's pan, and his imperfect knowledge of French, he could only distinguish the words of 'traitor'—'perfidious monarch, tremble and fear,' &c. very frequently repeated. Growing somewhat impatient, Marlow was on the point of entering the room, at the imminent risk of destroying the effect of the best passage in Monsieur Dezille's play, when the latter, who was closely eyeing Madame Bernard's motions, hastened to wind up the critical scene with a kind of fierce flourish, threw his manuscript on the table, and in the excitement of the moment, recklessly swallowed down a burning cake just hot from the pan. His kind hostess gazed upon him with alarm; but Monsieur Dezille was perfectly cool and composed: it seemed, as Madame Bernard afterwards observed, as though nothing could have an effect upon him.

Thinking the moment favourable, Marlow now opened the door, and thrusting his head into the room, sharply asked Madame Bernard for his key. In a moment the good woman was by his side, pouring forth excuses for having given monsieur the trouble of coming so far; but then she did not think monsieur meant to come home so early. She protested, however, that his fire would be ready in a few minutes, and was leaving the room to prepare it for him, when, on discovering that he was, as she expressed it, 'wet to the bone,' she testified great concern, and earnestly intreated him to come in and dry himself near the stove. Marlow stiffly thanked her, and refused; but wearied at length with her importunities, and somewhat tempted, too, by the warm atmosphere of the room, he consented to enter, concluding that he should only stay a few minutes after all, and took a seat near the stove, upon which Adèle was now warming some wine for him, this being, in Madame Bernard's estimation, an excellent preservative against a cold. The French of every class possess an instinctive politeness, which teaches them that nothing can be more disagreeable to a stranger than to excite too much observation. Thus on this occasion, with whatever real cordiality they might have been disposed to eye 'the proud Englishman, who spoke to nobody,' Madame Bernard's guests showed no token of it; and politely making room for Marlow, took as little notice of him as possible.

Everything went on as though he had not been there. Two bottles of cider were brought out, and uncorked in great ceremony by the locksmith, whose health and that of Madame Bernard was drunk by every one present; a compliment which was duly ac-

knowledgeed and returned. The cider (it cost ten sous, or fivepence a-bottle) was pronounced delicious. Marlow was amongst the first invited to test its merits, but as he refused in a very peremptory and morose tone, Monsieur Bernard had tact enough not to use any pressing. The hot roasted chestnuts were next produced in a large earthen dish, and every one immediately began peeling and eating them with great relish. This is a very favourite amusement in France, both with children and grown-up people amongst the poorer classes, who particularly enjoy it by the fireside on cold winter evenings. Its greatest merit is, that it does not interfere with conversation; and so Marlow soon found, for the table having been removed, every one drew round the stove, and became very chatty.

Monsieur Dezille was evidently the wit of the party: he could not open his mouth to swallow a chestnut, or utter a bon-mot, but the locksmith was ready to laugh and be amused, whilst Madame Dezille admiringly turned up her eyes. Even old Monsieur Ricord's grim features occasionally relaxed into an approving smile; as to the niece and children, they were in perfect ecstasies, laughing and clapping their hands with glee at everything they saw or heard. But as he witnessed the mirth and enjoyment of those around him, Marlow's gloom and ill-humour increased: he sat apart, scowling on the company, or smiling with undisguised contempt at Monsieur Dezille's most brilliant witticisms, and often impatiently glancing towards the door, as though wishing for Madame Bernard's reappearance. All advances to conversation he scornfully repelled.

Once or twice, however, Monsieur Dezille, who longed to enter into a literary controversy with him, adroitly made a few preliminary remarks on the weather, having heard that this was a favourite subject with all Englishmen; and thence suddenly plunged deep into epic poetry and the art of ballad-making, the latter of which he placed far above the former, as being much more interesting, and certainly more difficult. 'And this,' as his wife observed, 'Monsieur Dezille ought to know, being in the habit of writing charming ballads himself.' She did not say whether he also wrote epics.

But to all this Marlow turned a deaf ear: he was not to be pleased or soothed; and when he did condescend to reply, it was to make a sharp attack on all authors and poets in general, in the abuse of whom he was materially assisted by the sour old man with the fiddle, who spoke for the first time since his entrance; and though avoiding the mild deprecatory glance of Madame Dezille, was twice as fierce and pungent as himself, all his natural crabbedness having seemingly returned. Monsieur Dezille heard them both with much philosophical composure, smiled once or twice upon them, and as he made no reply, soon silenced them on that subject at least; for Monsieur Ricord, who, when once aroused, was not easily quieted, finding no more to say on poets and poetry, launched out into the praises of his fiddle, the only earthly object for which, it was asserted, he felt any love or sympathy.

Now this very fiddle had long been a source of annoyance to our hero; its diabolical squeaking sounds had more than once wakened him out of his sweetest morning slumbers; and then its owner had a knack of harping upon one peculiar string, which so jarred with Marlow's delicate nerves, that he was not at all sorry to find an opportunity of retaliating. Besides, why did the Bernards invite this disagreeable old man to their party? Monsieur Dezille and his comedy were already bad enough. So, without further fear or mercy, he began abusing the unfortunate fiddle; and, spite of the groans and indignant remonstrances of its owner, clearly showed it to be ill-made, old, crazy, and out of tune.

It was in vain that the gentle Madame Bernard, who was now in the room distributing the pancakes, cast a beseeching glance towards him, as though to beg for his silence, and even once or twice hinted that his wine was warm and his fire lit. He eyed her sternly; and as his bile was fairly roused, he suddenly turned upon her, and

in a style which the bitterness of his feelings rendered almost eloquent, began a pointed attack on the extravagance of those persons who endeavour to rise above their station in life by imitating the follies of their superiors. As this was a subject which always inspired Marlow with ready and forcible arguments, his words soon produced a visible effect upon his listeners. Gradually a cloud came over the honest and merry visage of the locksmith; even Madame Bernard looked somewhat doubtful, as though she did not feel quite certain of being in the right; and the children instinctively drew away from the *Monsieur Anglais*, whom the old bachelor still eyed with indignant feelings. Monsieur Dezille alone preserved an unalterable serenity; and whilst the others allowed their cider to stand still, and the pancakes to grow cold, he enjoyed both with unabated gusto.

When Marlow at length came to a pause in his discourse, Madame Bernard observed—'I am afraid monsieur's fire will be out now; but if monsieur will stay here till I light it again—'

'No, thank you,' interrupted Marlow, who, as he felt conscious of having damped, if not destroyed, the enjoyments of all present, experienced certain twinges of conscience; 'I shall go to bed directly;' and taking the light which his hostess offered him, without, however, her usual cordiality, he retired to his apartment, endeavouring to persuade himself that he had no reason to repent of what he had done, since he had merely given the Bernards a bitter, though salutary lesson.

When he reached his room, he found that, according to Madame Bernard's prognostication, his fire was quite out—worse still, he had forgotten, in his excitement, to take the hot-sugared wine prepared for him by his kind landlady; his clothes were not half dry; he was cold, and felt in a miserable plight. Somehow or other his remorse began to revive: his certainty of having acted rightly was not now quite so strong; nay, he even fancied he might be in the wrong.

'After all,' said he abstractedly, seating himself opposite the blank and dreary fireplace, 'what great harm did those honest people commit in amusing themselves cheerfully and innocently? They were not idle; for, save the locksmith, and the little author, and the old bachelor, every one was occupied. The author's wife was embroidering a purse; Madame Bernard had been mending her husband's socks; and I think that even the little girls were busy with their samplers. All this was very right. Then how much,' continued Marlow, 'may they have spent? Why, a franc or two! Surely that is not too much for a little of that honest cordial enjoyment which I so wantonly destroyed? Yes, I have deprived them of their innocent mirth: I see it all. Madame Bernard and her husband are bitterly reflecting on their folly, and cast cold looks on their guests, who begin to experience the galling feeling that they have ceased to be welcome; the very children are sulky and sleepy, and every one is thoroughly miserable; and this,' he exclaimed aloud with great warmth—'this is my doing! Nay, it shall not be said that when I see an error, I do not know how to repair it. I will go in to them this minute, and cheer and comfort them, if, indeed, it be still in my power to do so.' And so saying, he rose from his seat, and with a hasty stride proceeded towards the door; but when his hand was on the lock, he paused. 'What excuse shall I give for going in again?' said he to himself. 'Pshaw! did I not leave my hot wine behind me, and is not my fire out?' he added with a shiver; and without further delay, he opened his door, and advanced towards that of the Bernards, from which he was only divided by the landing. He had not, however, gone a step, before he paused with sudden surprise. Surely it was an error? But no; his ear did not deceive him: the merry sound of a fiddle was proceeding from the apartment within. It so chanced that, on coming out a few minutes before, Marlow had left the outer door of Madame Bernard's kitchen half open, as

he now perceived by the streak of light which lit up the landing. Impelled by strong curiosity, he approached the door, and without entering, peeped in. Owing to the glass door, he could partly discern what was going on in the second room.

To his indignant astonishment, the individuals whom he had left, according to his belief, in a state of desponding gloom and melancholy, were now evidently in high glee, and enjoying themselves to the best of their power. The old bachelor, who seemed quite merry, was scraping away on his fiddle with indignant vehemence, as though to clear it from Marlow's calumnious aspersions; Monsieur Dezille was lustily singing one of his own songs to its accompaniment, whilst the locksmith merrily beat time on the table, and the children and the niece danced at the other end of the room. The melancholy Madame Dezille herself looked happy for once: Madame Bernard only looked as she ever did look—the most cheerful and contented of human beings. To crown the whole, Marlow distinctly recognised in the black mug which amicably stood between the old bachelor and Monsieur Dezille, the identical one into which his hot-sugared wine had been poured. His interference was evidently quite unnecessary to restore a good feeling amongst all present. However contradictory it may appear, Marlow was by no means delighted at this unexpected result, but retired to rest in high dudgeon with himself, his landlady, and the whole world.

When he awoke the next morning, his natural good sense restored him to a better feeling. He perceived the folly and unreasonableness of his expectations. Why should others deprive themselves of innocent enjoyments to please or indulge his misanthropic whims? 'Surely,' he added with a sigh, 'this world is often sad enough for many of us; let a few at least find some pleasure in it.'

When Madame Bernard, therefore, came to light his fire, and prepare his breakfast, he received her quite cheerfully; and after making a few general remarks, candidly expressed his regret at having said anything on the preceding evening that might have damped the enjoyments of herself and her guests.

With much simplicity and earnestness, Madame Bernard assured him he need not trouble himself on that account; that he had not at all destroyed their pleasure; and indeed that they had never been merrier than after he was gone.

Marlow was disconcerted for a moment, but he soon rallied; and being determined to do his duty to the end, continued his discourse, and very clearly proved to his landlady that both she and her husband could not possibly do a wiser thing than to enjoy themselves occasionally with their friends.

Madame Bernard, who perhaps knew all this as well as he did, and maybe, too, a good deal better, heard him very patiently, and when he had done, merely observed—'Why, sir, as my husband has to work hard all the week, and is not very strong, it is only fair he should get a bit of amusement now and then.'

'Very right,' approvingly replied Marlow; 'but might you not select your guests more judiciously? Now, that Monsieur Dezille and his comedy seem to me rather absurd.'

'Well, sir, we are ignorant people, that do not understand much of these matters; but Joseph says he likes to hear Monsieur Dezille talk, because, as he knows more than himself, he can always gather something useful from him. Then he and his wife are rather nice people, and, to tell you the truth, sir, rather poor, though too proud to own it. Yet as I knew that Madame Dezille had had no fire these last three days, cold as they have been, I asked her to come in to teach one of the girls how to embroider purses, which she, poor soul, very willingly did, and warmed herself at the same time. Then I said how glad Bernard would be to hear her husband's comedy. So he came too; and as I thought he sometimes went without his supper, I made

a few pancakes, and Bernard got a bottle or two of cider. It did not cost much after all—only two francs—and it made us all glad and merry, and they never suspected anything.'

Though he had always thought his landlady a simple, good-natured sort of woman, Marlow had by no means been prepared for the delicacy of feeling this last trait betrayed. For a while he remained silent, but determined to make another objection. He observed—'But what motive could induce you to invite that cross old man and his abominable violin?'

'Ah, sir,' reproachfully exclaimed Madame Bernard, 'how sorry I was when you abused that violin so! He values it above anything else; and no wonder too, for it belonged to his only brother, who died many years ago; and he often talks of that brother, and says, with tears in his eyes, how beautifully he played upon that very instrument: and indeed he seems to think it is the only violin upon earth; but that is only because it was his brother's. I can assure you, monsieur, that he is not so crabbed as he seems. He is a tender-hearted creature. I have looked into his room, and actually seen him sobbing, as if his heart were like to break, over that poor violin. What an affectionate remembrance he must have of his brother!'

'Well, if such is the case, I am really sorry to have ever said a word against it,' replied Marlow rather moved; 'but I thought this old gentleman was no favourite of yours, and indeed he seems to be cross and surly enough.'

'Well, sir,' said Madame Bernard in a grave and somewhat penitent tone, 'we should never judge by appearances, for he is not half so cross as I thought him, though I should never have known it but for Madame Dezille; and this is one of the very things which, though I did not find it out till before yesterday, made me like her still more. Would you believe it, sir, both she and her husband have, for the whole winter, been attending on that old man, who is almost always laid up with the gout, and is no friend or relation of theirs? And they say that, with all his crossness, he is very kind, and wanted to do something for them out of pure gratitude; but seeing that he was almost as poor as themselves, they refused, and that was what made him so ill-tempered with Monsieur Dezille last night, though I believe they were friends again long before they parted. And you now see, sir, how it was we could not do less than invite him also.'

As Marlow had nothing to reply, and did not seem inclined for further conversation, Madame Bernard soon left him to his own reflections, little suspecting that it was her discourse which caused this deep fit of musing. 'Well,' thought he when he was alone, 'how little I knew of all the genuine kindness, charity, and feeling which lay concealed under the homely aspect of those worthy people, whose innocent enjoyment I vainly endeavoured to destroy. Now that I think better of it, I no longer wonder at their cheerful, happy faces. But how pure and blessed,' he added with a sigh, 'is that dower of a contented spirit—the art of enjoyment—since it can shed such genuine delight over what were otherwise insipid and flat, and invest an old fiddle, a bottle of cider, and a few chestnuts and pancakes, with more real pleasure than is to be found in those splendid entertainments where guests only bring with them the weariness and ennui of worldly minds!'

Frank Marlow was a cured man. We will not assert that it was exclusively Madame Bernard's party, and the thoughts it awakened, which wrought a reformation in his mind. He was already tired of inactivity, and a few letters from a friend in England had contributed to arouse him from his morbid lethargy. He saw that all along it had been himself, not the world, which was to blame—that the earth may become a scene of gloom or gaiety, misery or happiness, just as we use its bounties. In less than three weeks he announced to his landlady his intention of returning home. She heard him with regret; and as he had in the meanwhile effected a re-

conciliation with Monsieur Dezille, and the owner of the violin, everybody was truly sorry to part from him. Marlow himself felt some emotion when the hour came; but England, which was before him, and the hope of retrieving his fallen fortunes, soon banished the transient feeling.

He brought energy and perseverance to his new task, and in a few years was in as prosperous circumstances as ever. All his former extravagance seemed to have vanished; he did not, however, fall into the contrary extreme, but always entertained his friends in a manner suitable to his station in life: still they frequently heard him observe, that the most pleasant party he had ever seen had only cost one shilling and eightpence; 'though, to be sure,' he added with a smile, 'what was wanting in good cheer, was amply made up by kind hearts, contented spirits, and the genuine art of enjoyment.'

Should the reader feel any wish to learn the fate of the Bernards and their neighbours, we can only inform him that they are still residing in the same house. Monsieur Dezille's comedy has not yet been acted, but it continues, with old Monsieur Ricord's violin, to form the delight of the whole landing. Upon the whole, they are much in the same state as when Frank Marlow saw them; neither richer nor poorer, but as merry and good-humoured as ever.

CURIOSITIES OF OPPOSITION.

IMPROVEMENTS in methods of travelling have one after the other had to encounter the severest opposition. The managers of the older kind of roads opposed the making of roads of a better kind; then roads persecuted canals, and canals persecuted railways. Wagons were opposed to stage-coaches, and stage-coaches were furious at the introduction of locomotives. Let us go back on a few of these curiosities of opposition.

In 1580, according to the old chronicler Stow, the farmers and maltsters attempted to break down the banks of the river Lea, which had then been made navigable about Enfield, because their business of land-carriage would be injured by the greater cheapness of water-carriage. In 1662, when there were but six stage-coaches upon the road, a Mr John Crossell of the Charter House attempted to write them down—it has been said, at the suggestion of the country gentlemen, who feared that opportunities for quick travelling would have a bad effect on the domestic habits of their wives! In the year 1673, the opposition appeared anew in print: the writer of a pamphlet at that period demonstrated the ruin of the country unless the great numbers of coaches and caravans running on the roads, particularly in the neighbourhood of London, were put down. It was urged that rapidity of transit, by preventing travellers from stopping to eat on the road, would be fatal to innkeepers; and that, as less property would be wasted by the new method than by the old one, of packhorses, many mouths would come short of bread. Parliament was besieged with petitions to the same effect from all parts of the country. And coming down to the general extension of turnpike-roads into the provinces during the past century, we find the farmers in the counties near London petitioning against the improvement, as their own market would be spoiled if others from a greater distance were allowed to supply it with produce. When steamboats were first started to Margate, the coach proprietors along the road memorialised the legislature on the subject, showing that their trade would be ruined unless the vessels were immediately suppressed. It was found, however, that in proportion to the increase of visitors to Margate, the more coaches were wanted. The watermen of the Thames raised a formidable opposition to the new mode of travelling; and it is interesting to look at what they wished to retain to the exclusion of the rapidity and certainty of steam. 'It is scarcely half a century ago,' says a writer, 'since tilt-boats for the conveyance of

passengers to and from London and Gravesend were, in shape and speed, just what the Trinity-House ballast lighters are at present, and taking four tides and more for the completion of the voyage. They were succeeded by the Dundee boats, which were, as fast sailers, both the wonder and admiration of all who witnessed the improvement. They, however, were of the most inconvenient nature, as the passengers were frequently not only called upon to embark in the middle of the night, in order to have the first of the flood, and after tacking and beating about together, with sometimes too much wind, sometimes too little wind, or none at all, besides being huddled in a low inconvenient cabin, were frequently, after being six or eight hours on the water, compelled to land at Woolwich, Blackwall, or Greenwich, and then have to find their way, in the best manner they could, to the metropolis.

Although by the construction of canals, and improvement of roads within the past fifty years, the means of communication were greatly increased, the expense of conveyance, both of merchandise and passengers, was enormous. Within that period, the charge for the carriage of goods from London to the Yorkshire towns was L.13 per ton. The trade of the great manufacturing towns of the north was cramped not only by this expense, but by the delays attending it. Besides the turnpike road, there were but two canals for the enormous traffic between Liverpool and Manchester. These might, perhaps, have sufficed for some years longer; but the proprietors, confident in their monopoly, charged most exorbitant freights—L.2 per ton—and took no pains to insure the quick transit of merchandise. Goods shipped at New York often reached Liverpool in less time than was consumed in forwarding a cargo from Manchester by canal, a distance of fifty-five miles. Boats could not be found to carry the goods—about one thousand tons daily, producing a revenue of L.200,000 annually. So great were the profits on one of the canals, that every alternate year the owners received back the amount of their original investment. They, however, never considered it necessary to take any active measures to remove the evils so loudly complained of, and, blind to their real interests, pocketed the dividends, and snapped their fingers at the public. A third canal was sometimes talked of, but the two already in existence monopolised, together with the trade, the whole available water of the district. Under these circumstances, several enterprising merchants in the two towns formed a project for a railway—a means of transit that had long been known in the coal districts on the Tyne. They first attempted to prevail on the Duke of Bridgewater's canal agent to afford them increased accommodation and abatement of charges; they did not so much object to canals, as to the want of facilities for transport. Finding the agent unyielding on these points, they proposed to him to become a purchaser of railway shares, and received for reply, 'All, or none.'

The earliest mention we have of railways occurs in the life of Lord Keeper North, 1676. 'The manner of the carriage is by laying rails of timber from the colliery to the river, exactly straight and parallel; and bulky carts are made with four rollers fitting those rails, whereby the carriage is so easy, that one horse will draw down four or five chaldrons of coals, and is an immense benefit to the coal merchant.' With the occasional substitution of iron for wood, the railway remained as above described, and confined to the coal fields, until about thirty years ago. In the years 1820-21, Thomas Gray, an individual now living in obscurity in Devonshire, petitioned parliament on the subject of a general system of railways for the whole kingdom. Although he met with a few supporters, yet the book which he published explanatory of his views was cried down by the reviewers as the work of a dreamer or lunatic. In 1825, a railway was opened from Darlington to Stockton, for the carriage of coals from the former place to the mouth of the Tees, on which a

locomotive engine drew the wagons at the rate of five miles an hour. Watt first hinted at the possibility of constructing such engines in 1769; and in 1787, the first model probably ever seen was exhibited by Symington at Edinburgh. In 1802, after making experiments at Merthyr Tydvil, Messrs Trevithic and Vivian took out a patent for a locomotive engine for railways. The idea, however, of attaining any great speed, seems never to have been entertained, and was ridiculed by all practical men. Some modifications of the machinery were soon after introduced by Blenkinsop and Blackett; and in July 1814, Stephenson's first engine was tried on the Killingworth railway, near Newcastle. To this place a deputation was sent from the Liverpool and Manchester Committee; and although the rails were much worn, and very imperfect, the visitors saw heavy-laden coal wagons drawn by an engine at the rate of four miles an hour. The moderate nature of their expectations may be judged of by the fact, that five miles an hour was considered as great speed as it would be desirable to accomplish. After witnessing numerous experiments, the deputation returned to Liverpool, and the intended railway was publicly advertised. A capital of L.400,000 was to be raised in L.100 shares, no person to hold more than ten. So confident were the promoters of the scheme of its success, that the whole sum was subscribed in the course of a few hours.

The expense of constructing the proposed railway was estimated at L.12,000 per mile. Application for permission to commence the work was made to parliament, but with slender hopes of success. The public announcement of the scheme at once excited a fierce war of opposition. The canal owners commenced with the cry of 'vested rights,' to which the prosperity of a great community was to be sacrificed. The formation of a railway, it was contended, would be destructive to all private property along the line, and depreciate the value of the adjacent land. The most exaggerated statements were circulated respecting the introduction of railways; coachmen, grooms, stable-boys, and porters, joined loudly in the general clamour. It was asserted in the evidence before the parliamentary committee, that if railways became general, a million of horses would be thrown out of service, to the entire deterioration of the breed, and the abandonment of the 8,100,000 acres of land required to grow oats for the animals. Time has shown the fallacy of this assertion, for more horses than ever are required to carry on the increased traffic at branch lines and cross-roads. According to Mr Porter, if the whole of the turnpike roads in the kingdom were converted into railways, the number of horses unemployed would not be more than 785,312. A comparison of the returns for 1823 with those of 1843-4 shows a decrease of 1,706 horses only! The projectors of the new railway set down but a very small item in their estimated returns for passenger traffic, and were in doubt whether to use locomotive or stationary engines to draw the trains. Passenger traffic, it was still considered, would be confined to the turnpike roads; and many attempts were made to construct engines to supersede the ordinary stage-coaches on these roads. The same opposition was, however, manifested with regard to this experiment as to the railway. The committee of the House of Commons reported 'a determination on the part of the trustees to obstruct as much as possible the use of steam as a propelling power.' Having entire command of the roads, the trustees determined to put down the new machines by enormous tolls. On the Liverpool and Prescot road, the charge for a coach was four shillings, while Mr Gurney's steam-carriage was charged L.2, 8s., and in some instances L.3, 8s., at every gate. The roads were newly gravelled, or strewed with loose stones, besides other contrivances, for impeding the passage of the engines. The committee, however, decided 'that the substitution of inanimate for animate power is one of the most important improvements in the means of internal communication ever introduced;' but at the same

time expressed their opinion that 'one very formidable obstacle will arise from the prejudices which always beset a new invention, especially one which will at first appear detrimental to the interests of so many individuals.'

After much vexatious opposition through two sessions of parliament, the act to incorporate the Manchester and Liverpool Company was passed in 1826; the works were immediately commenced, but the opponents of the scheme relaxed nothing of their hostility, nor was the public mind assured as to the success of the enterprise. When the Company decided on adopting locomotive engines, they were ridiculed in every quarter; great speed was declared to be not only impossible, but unsafe. Treatises were written to demonstrate the danger of travelling faster than nine or ten miles an hour, and to leave on record the authors' want of sympathy with such 'crack-brained speculations'; and their hope that parliament would restrict the speed to the rate proposed, in all bills submitted to them for sanction. An alarm cry was raised as to the danger of high-pressure engines, which took so great a hold of the public mind, that to this day many persons are unwilling to trust themselves behind a locomotive. The Quarterly Review, at that time a much more influential journal than at present, joined the hostile ranks. We cannot give a better specimen of the arguments by which it was attempted to write down one of the noblest elements of civilisation than by a quotation.

'As to those persons,' says the reviewer, 'who speculate on making railways general throughout the kingdom, and superseding all the canals, all the wagons, mail and stage-coaches, postchaises, and, in short, every other mode of conveyance by land and by water, we deem them and their visionary schemes unworthy of notice. The gross exaggerations of the powers of the locomotive steam-engine, or, to speak in plain English, the *steam-carriage*, may delude for a time, but must end in the mortification of those concerned.*' The writer then quotes a paragraph from the report on the proposed Woolwich railway, containing a fair estimate of business and profit, on which he comments thus:— 'We are not surprised that people, who probably never saw a steam-engine or a railway, should put their names to such pure nonsense as this; but we hardly expected that Mr Telford, the engineer, should have lent it the sanction of his; nor to find a countryman of Mr Telford writing thus:—"We shall be carried at the rate of four hundred miles a-day, with all the ease we now enjoy in a steamboat, but without the annoyance of sea-sickness, or the danger of being burned or drowned." But with all these assurances, we should as soon expect the people of Woolwich to suffer themselves to be fired off upon one of Congreve's *ricochet* rockets, as trust themselves to the mercy of such a machine, going at such a rate. . . . We will back old Father Thames against the Woolwich railway for any sum.'

How exceedingly absurd this now appears to us, and what a lesson does it convey to those whose doubts are always readier than their sympathy! But the progressive movement did not lack defenders. A writer of the day, after showing the inconclusiveness of the reasoning, winds up by saying, 'It is reasonable to conclude that the nervous man will, ere long, take his place in a carriage drawn or impelled by a locomotive-engine with more unconcern, and with far better assurance of safety, than he now disposes of himself in one drawn by four horses of unequal powers and speed, endowed with passions that acknowledge no control but superior force, and each separately, momentarily liable to all the calamities that flesh is heir to.'

The best reply, however, to these envious or interested arguments was furnished by the public opening of the railway in 1830. What railways have since become, it is unnecessary to mention; and we need only

recall the fact, that in the fourth year ending June 1845, after the publication of the above observations of the reviewer, 33,791,253 persons travelled by railway in the United Kingdom.

A FEW SOCIAL FACTS.

By a paragraph in a newspaper, we observe that the Rev. P. P. Carpenter has lately concluded a course of lectures, in which some interesting facts were brought forward respecting the social condition of Warrington. It was stated that in that town there are twelve places of public worship, and as many schools, open every Sunday for religious instruction; that there are eighty public-houses and fourteen beer-shops also open on the same day, for the purposes of intoxication; and that three-fourths of the adult population attend no public worship at all. There are forty-seven private, and eight public schools, in which daily instruction is given to 2885 scholars. About as many children are taught on the Sunday; and all that is raised by the inhabitants annually to educate the poor is L.300; while there are nearly one thousand children growing up in ignorance, and nearly two-thirds of the people married are unable to write their names! The whole town raises L.3200 per annum for all its religious, benevolent, and literary institutions, including schools, missions, Bible and tract societies, and ladies' charity; and spends L.68,000 on intoxicating drinks. Yet taxation is complained of, although all the rates in the town do not amount to L.9700 per annum. It was also stated that there were at least 1500 drunkards in the town; that in one street alone there were more than forty drunken women. Finally, that the sum of L.1460 is spent in the detection and punishment of crime; while upon the education of the poor, as above stated, no more is expended than L.300.

Assuming these facts to be correct, they suggest some unpleasant reflections on the disparity between the expenditure for improvement, and that for demoralisation—the halfpenny for bread, and the half-crown for sack—the grudgingly-doled pence for education, and the lavishly-dissipated pounds for sensual indulgence! Warrington, however, need not hang down its head on account of these disclosures. The same thing can be said of pretty nearly every town of its size in England, manufacturing or non-manufacturing; and we are rather afraid that something much worse could be said of Scotch towns, with all their pretensions to decency. Those who entertain the notion that small towns in rural districts are models of innocence and temperance, and that all hard-drinking is confined to busy seats of trade, will perhaps have reason to review their opinions on perusing the following particulars, which we gather from the Peeblesshire Advertiser.

The county of Peebles is one of the smallest in Scotland; in 1841 its population was only 10,499, of whom nearly 2000 inhabited the county town, an ancient royal burgh. Our authority goes on to mention that there are 29 public-houses in the landward part of the county, and 24 in the burgh, making altogether 53, or one for every forty families; the average, however, for the burgh, is a public-house for every fifteen families. To put the fact in an equally striking light, we may mention that in the whole county there are 2832 males betwixt the drinking ages of 15 and 65. Take off a fifth for those who do not frequent public-houses, and you have 2266 males supporting 53 public-houses, or one public-house to every 42 males. A similar average for the burgh alone shows one public-house for every 22 males. This is, in effect, as if each of these parties submitted to pay a yearly tax of L.2, 14s. 6d. for the support of a publican, which would allow him L.60 per annum of profit, to pay his licence, rent, and keep himself and family. To pay this self-imposed tax, each customer must consume a large quantity of drink, as the prime cost of the liquor is levied from the consumer, along with the publican's profit. Assuming that the

profit is 25 per cent. of the money drawn, then we have 514 males, the number in Peebles (deducting as above), paying L.10, 18s. each yearly for strong drink, or L.5602 in all. We believe it within the mark when we assert that from L.8000 to L.10,000 must be spent in the county annually on excisable liquors.' Pretty fair allowance this for a small rural district!

It may be observed, that in nearly all newspaper notices of this subject, no other plan for stemming the torrent of intemperance is proposed than limiting the number of public-houses. There can be no reasonable doubt that the temptations which these establishments offer, help materially to create habits of intemperance. But, after all, this is not the thing to keep exclusively driving at. Public-houses would not exist were there not a demand for their services; and it appears to be a clear case that, unless the demand is lessened by improved habits among the people, little good can come of the fiery crusade against these establishments. In London, where public-houses are organised on monopoly principles, intemperance is not by any means put down. It matters little whether ten thousand drams are dispensed by one shop, or ten shops sell one thousand drams each. Perhaps the limitation is injurious. Denied licenses, people set up private drinking establishments, the resort of the worst of characters, and into which no police-officer can intrude without a warrant. Houses of this unprivileged order are infinitely more mischievous than those that are licensed and under the eye of the law. Such is mentioned to us in reference to London, and we know that such also is the case as regards Edinburgh. Some time ago, two or three respectable drapers in the High Street of the latter city hired and paid a constable to do nothing else than keep order at the door of an unlicensed public-house, which was a nuisance to the neighbourhood. In short, it appears from all evidence, as well as from reason, that intemperance is not to be eradicated, though possibly it may be modified in a small degree, by a limitation in the number of public-houses. Neither is it to be quelled by any fanatical outrage on the feelings, nor by any increase in the duties payable on malt and spirits. Were these excise duties to be raised, illicit distillation, and an extensive contraband trade, would immediately commence. Let the friends of temperance be quite assured of the fact, that nothing will remedy the monster evil but a substantial improvement in the tastes and habits of the people.

TRAVELLERS' TALES.

THE misrepresentations of tourists and travellers are notorious. Few among them seem to possess the faculty of judging dispassionately of any incident which falls under their observation. A single fact serves as a basis for a structure of reasoning; while, for lack of a knowledge of circumstances, the most unwarrantable inferences are often drawn. In this manner, writers are constantly misrepresenting what they see passing before their eyes, if not inventing facts in order to bear out recklessly-adopted theories. To all appearance, the English are doomed never to attain a fair understanding of the American character, in consequence of this imperfect or prejudiced method of writing; and it seems still more certain that the French and English are for ever to enjoy a thoroughly erroneous conception of each others' character, habits, and manners.

The blunders almost daily committed by French writers in treating of England are most amusing. Our readers have doubtless heard of a mass of trashy extravagances called the 'Mysteries of Paris,' but they are probably ignorant that there is a book, likewise by a French author, called the 'Mysteries of London.' This author styles himself Sir Francis Trollope; but, to prevent the mistakes of posterity, we shall mention that his real name is Paul Féval. This gentleman tells us that he was long and intimately acquainted with London society, flitting about from the

drawing-rooms to the clubs, from the clubs to the taverns, and equally *au fait* of the manners of peers and pickpockets. The fact is sufficiently proved by an incident in the 'Mysteries,' which would not readily occur to an English novelist, but which holds a deservedly prominent place in the nine volumes of Sir Trollope. The Earl of White Manor becoming desirous to part with his countess, takes her out into the market with a rope round her neck, and offers her for sale. And this is actually detailed in a book purporting to be written by a person who knows England! Well might the work be entitled 'Mysteries.' This enlightened author gives, likewise, the history of a struggle between the same nobleman and his younger brother, Sir Brian de Lancaster. Sir Brian is the victim of the law of primogeniture, and struggles against his destiny with a passive heroism which commands the sympathy and admiration of the whole metropolis. His brother has had the criminality to become the earl, for no better reason than that he was born before Sir Brian. This is the thought that haunts the younger brother, and fills him with the deadliest hate. In vain Earl White Manor proposes to neutralise, as far as possible, the injustice of fate, by settling upon him a handsome allowance. He rejects the composition with scorn; he descends proudly into beggary; he sells matches in the streets; and derives the only compensation his misery admits of from the fact of his being able to accost the Earl of White Manor publicly, requesting him to buy a pennyworth from his younger brother.

The hatred subsisting between the English and French nations is philosophically accounted for by our author, by a reference to the dislike one naturally imbibes against the unfortunate person who *lends* him anything. We borrow fashions, cookery, dancing, plays, corsets, and a hundred other things from the French; and of course we hate the very name of our creditor. The Englishman, besides, is intensely egotistic. He cares for nobody, not even for his own countrymen; and he will look calmly on while a thief picks his neighbour's pocket: the great London maxim being, 'Every one for himself.' Owing, no doubt, to this metropolitan peculiarity, the 'Family' has become one of the most prodigious institutions recorded in history. What is the 'Family'? It is a society of robbers, perfectly well known to the police, and consisting of noblemen, clergymen, merchants, and others. These distinguished characters speak in a language which of late years has become so familiar in our drawing-rooms, through various recondite publications, that it is hardly necessary to say that 'to stump up' means to pay, that a penny is a 'mag,' sixpence a 'tanner,' a shilling a 'bob,' and so forth. The chief of this society, we are told, is an Irish adventurer, calling himself the Marquis de Rio Santo. The whole female aristocracy of London are pulling caps for this grandee, who derives a handsome revenue from smuggling, robbery, and coining, and without whom no soirée in the metropolis is complete. One of his comrades is a Jew, who was cut down from the gallows, and who now passes without suspicion as Sir Edward Mackenzie.

Our attention has been called to this book, and another we shall presently mention, by a last year's number of the Foreign Quarterly Review, a periodical which has merged since then in the Westminster Review. The writer, however, in his remarks on national character, exhibits, singularly enough, the very same failing it is the object of his article to expose. He admits—for it is impossible to deny the fact—that there are some excellent French books on England, far better than any English books on France; yet he adds, that even when a Frenchman is well-disposed towards us, 'we must still believe him to be essentially incompetent to form a correct opinion not only of us, but of every foreign nation. The French mind is the least flexible of any. The prejudices of an Englishman are neither wise nor agreeable; like all prejudices, they make the possessor ridiculous, offensive, and short-sighted. But

an Englishman needs very little travel, if he have two grains of intelligence, to make him give up all such prejudices as are not wholly moral. This the Frenchman cannot do. France is his invariable standard, because he identifies himself with it. This appears to us to be quite erroneous. A Frenchman is a far better citizen of the world than an Englishman; and so far from being bigotted to the customs and character of his own countrymen, we have generally found him too unreflectingly disposed to admire ours. There is just one thing he cannot away with, and that is our mode of passing the Sunday. At home they sing, dance, and go to the theatre, and have done so as far back as his knowledge of history extends; and he thinks there must be something faulty in a state of society which condemns him to feel so miserable on a day which his own countrymen set apart for merriment.

The reviewer is more happy in accounting for some of the mistakes of our French visitors. 'In every case,' says he, 'he "boards in a family." He has a nice little drawing-room *au premier*; he takes his meals with the family. The friends of that family become known to him. He is invited to their houses; he observes their manners; and he generalises from them. A cautious man might easily make this mistake of hasty generalisation. For observe, that to a Frenchman his landlady is a lady. He of course cannot draw nice distinctions in manners; and the mere fact of his landlady taking a boarder, is to him insignificant. As no one in France has a whole house to himself, to "let lodgings" is the most natural thing in the world. Now, although we are quite aware that straitened means are not always synonymous with inelegant manners, we must still say that, with due allowance for individual exceptions, the class of society in which a man mixes who mixes with the friends of the family in which he boards, is not a representative of English breeding—is not the type which Englishmen recognise.' This is, unquestionably, a source of error, and one that most Englishmen in Paris escape. But if an Englishman is less likely to misinterpret what he sees, he is, on the other hand, less in the way of seeing anything at all. He mixes almost exclusively with his own countrymen. He settles in a neighbourhood which is peopled by the English; he haunts a café where they resort; and thus, whatever number of grains of intelligence he may possess, instead of giving up his prejudices, he strengthens them.

The work of another French writer, equally amusing for its blunders, has attracted our attention. It is entitled 'Zambala l'Indien; ou Londres à vol d'Oiseau,' by J. Arago, brother of the astronomer. This gentleman's travels were not confined to London: he made a tour of the globe, and has written his 'Voyage autour du Monde.' He is therefore a man very little likely, one would think, to be deceived in scanning the aspect of metropolitan society. With experience so vast, he has only to look in order to see; and we no doubt shall find in his book original and enlarged views of ourselves. They are original!

M. Arago has a great liking for the English; but our mercantile character, he suspects, is carried to extreme. In every circumstance of life we seem to be at the desk or the counter, deciding everything by figures, and counting noses on all occasions. This is the case, he tells his readers, in our courts of law, where the evidence is weighed, not by its probability, but by the number of witnesses. A man who has four witnesses against two, gains his cause as a matter of course.

M. Arago, again, though a great admirer of our young ladies, considers their besetting peculiarity rather odd. It seems that, after taking a walk in unadorned beauty, they are in the habit of returning home with a superb necklace blazing on their bosom, diamond rings glittering on their fingers, or a rich diadem ornamenting their brow. This is strange enough, considering that the streets of London are no longer paved, as formerly, with gold; but what is still more wonderful is, that the circumstance excites no observation in the family.

Neither father nor mother inquires whence the fairy windfall has come; or if they do by any chance make a remark on the subject, the slightest reply satisfies them, and they even ask pardon for their indiscreet curiosity.

But the grand merit of M. Arago is his discovery of the true character of the new police. This calumniated body was formerly supposed to have a strange hankering after the kitchen areas, and no very vehement objection to a treat of cold meat, or any other unconsidered trifle at the hands of the admiring Molly. The very aspect of the man, however, according to our observer, is enough to disprove such allegations. He is delicately shaped; he has the bluest eyes in the world; and his small white hands proclaim the aristocrat of nature's making. His pale brow expresses the benevolence he is constantly practising; for, instead of dragging evil-doers roughly to the station-house, it is his business to persuade mildly, and preach with a gentle voice respect for the law. 'One amongst them was especially distinguished by the affability of his manners, the elegance of his language, the regularity of his features, on which were stamped an ineffable sweetness. He was a young man of about two-and-twenty, belonging to a family of honest tradesmen, of small fortune, but honourably acquired. Georges Oxley knew that he was handsome; for the *jeunes miss* who passed near him at first looked down, and quickly glanced up again, only to ascertain whether the eyes of the policeman were as soft and dreamy as they were reputed in the world. Further on they once more looked back to convince themselves that Georges possessed the grace and elegance which generally distinguish young men of good family; and then the *jeunes ladies*—still only from curiosity, for I will not dive further into their consciences—passed again, and let their handkerchiefs or parasols fall by chance, in order to be able to contradict public opinion, which endowed Georges with the purest pronunciation and the most harmonious voice. . . . His was a privileged nature; gentle and calm externally, warm and powerful internally, but so doubtful of his future, that a deep sentiment of sadness and bitterness was always to be read in his smile. Georges would never have had the power to run after happiness; he would have feared a deception; and therefore it was, perhaps, that when all was joy in his house, he alone, always at the post of honour confided to him, bore so much melancholy and timidity in his appearance and his words, that it was impossible to look at him without a strong feeling of interest, and a touching affection. Activity of mind and apathy of body sometimes go together. Georges Oxley thought, and thought a great deal; but when inquisitive looks, when maternal solicitude sought to guess the cause of his painful preoccupation, his broad and open brow became pure and serene—his manners, his language, recovered their natural manliness; and the more energy you found in him at that moment, the more you pitied him for the violence he submitted to from a sense of dignity.'

This charming policeman does not appear to be exactly in the station from which his class was formerly supposed to spring; and perhaps, therefore, his twenty shillings a-week, subject to a deduction for clothing, may be considered rather meagre remuneration. However, his family are quite 'respectable,' keeping, as they do, a lace warehouse; and thither the *jeunes miss* resort, under pretence of purchasing, but in reality to ascertain the extent of softness and dreaminess possessed by the policeman's eyes. One of these young ladies is Lady Emmeline, an earl's daughter, and her studies of the 'force' bring her too frequently to the lace warehouse for her peace. One day Georges is not there—in fact he is on his beat; and the things that are shown to her over the counter, and the stupid people who show them, are weariness and vexation to her spirit. But the policeman is not there; she is not to see his dreamy eyes; she is not to listen to the pure pronunciation of his harmonious voice; she is not to feel his small white

hands against hers as they are holding the lace together. Wretched and forlorn, the lovely Lady Emmeline at last leaves the shop; and meeting a beggar at the door, she drops a sovereign into his hands, whispering, 'Pray for me, and for him!' The reader is of course prepared to hear that Georges becomes the husband of Lady Emmeline, and the stepson of an earl.

All this seems very odd. It is difficult for us to conceive how men of the most ordinary intelligence could heap together such wild absurdities in what they intend to be a *bona fide* picture of English society. But Sir Trollope is not merely in earnest—he means his 'Mysteries of London' to contrast favourably with the 'Mysteries of Paris'; believing, as he does, that the imagination of Eugene Sue has to a certain extent run away with his judgment, and being determined that his own book shall owe its excitement only to its truth! As for the Circumnavigator, he has described England, we have no doubt, with just as much fidelity as all the other countries he has looked at with his own eyes, and yet never seen things truly as they were.

The foundation of the art of reporting correctly on foreign countries, appears to be nothing more than a profound conviction that human nature is pretty nearly the same everywhere. This conviction will prevent us from jumping at monstrous and absurd conclusions; it will give us the habit of inquiring into the *circumstances* that have occasioned the modifications we observe; it will teach us moderation and humility; and, while permitting us to indulge in a good-humoured laugh at Zambala and Sir Trollope, it ought to render us careful not to subject ourselves to similar ridicule.

JEAN PAUL RICHTER.

AMONG the great men of Germany, is one whose name is mentioned with pride by all his countrymen, with whose works all are acquainted, from the monarch upon his throne to the lowest labouring man, and whose fame is gradually spreading over the civilised world; this is the poet, the novelist, the philosopher, Jean Paul Friedrich Richter. This extraordinary man was born in the little town of Wunsiedel, situated in Bavaria, and among the recesses of that chain of mountains known by the name of the Fichtelgebirge, or Pine Mountains. The inhabitants of this region are very simple in their tastes and customs: their houses are made of wood, and thatched with straw; the men are employed in mining, while the women, as is generally the case in Germany, perform all the agricultural labours.

In the year 1763, our hero was born. His father was the organist of Wunsiedel, and his mother was the daughter of a cloth weaver in the manufacturing town of Hof. We know little of Richter during the first two years of his life. He says, in his autobiography, that he can remember nothing except the kindness of a poor boy, who carried him in his arms, and brought him milk to drink. In 1765, his father was appointed pastor of Jodity, and thither the family removed. He has given us long descriptions of his life while at this place. He tells us that his great pleasure was to learn everything, and he thought it a happy day when he first entered the village school-room. He seems to have made rapid progress in his studies; but his father, angry at the manner in which a peasant's son had behaved to him, removed him from school, and took the charge of his education upon himself. Seven hours were now daily devoted by Paul and his brother Adam to the study of the Latin grammar; and both felt it a hardship to sit within doors on a lovely summer's day, while his father was perhaps gone on a journey, having first appropriated to each of his sons their wearisome tasks.

The dry Latin rules did not, however, check the young Paul's ardour for learning, and he often stole into his father's library, devouring whatever book he happened to lay his hand upon. He tells us also that he made a clock and a sun-dial, and he even tried his skill in the use of the pencil. He seems to have been very fond of

music, and often devoted whole hours to playing upon an old harpsichord which was found in the parsonage. We will give our readers a translation from Paul's account of his life at Jodity:—

'We will start with winter and January,' says he: 'in the cold weather our father, like a herdsman, came down from his study, and to our great joy dwelt in the common sitting-room. In the morning he sat by the window, and learned his Sunday's sermon by heart, while we carried his cup of coffee by turns to him. Out of doors, all was covered with snow; but within, all was life. Under the stove was a pigeon-house; on the windows, goldfinches' cages; and on the floor, a bull-dog and a poodle. At the sound of the vesper bell in the evening, we placed ourselves in a circle, and chanted one of Luther's hymns. How much more pleasant were these winter evenings when, once a-week, the old errand-woman, with her basket of fruits and wares, entered the kitchen from the town of Hof, spreading cakes and pastries before our eyes!

'In spring we were let loose into the fields. We ploughed, sowed, and made hay. My father did not stand by as a hard taskmaster, although the labourers were his feudal tenants, but as a good shepherd, caring for the spiritual welfare of his children. In the morning I carried my father's coffee to the pastor's garden, which was outside the village; in the evening my mother brought us salad and fruit for supper; and after this my brother and I sprang about in our nightgowns, in the open air, as freely as the birds above us. On Sunday, before church, I went through the village with a bunch of keys, to open the pastor's garden, and to bring thence some roses with which to decorate the reading-desk. After church, my brother and I carried to the peasants the usual half pound of bread, and the money collected. I think no other professional man can form any idea of how much the Sunday's vesper hour is enjoyed when the church duties are over. How did we rejoice with our father when he exchanged his pastor's dress for his light coat, and set forth with us to enjoy the calm repose of the Sabbath evening in the fields!

'In the summer I used to be sent to Hof, not only to buy those necessities which were not to be had in Jodity, but sometimes, when we were short of money, to borrow some from my grandfather. Christmas and the annual fair were our great seasons of rejoicing, and my father joined us in all our preparations, sometimes even decking the Christmas tree with his own hands.'

From this little extract, our readers will see how very simple the lives of these mountain people are. They have few wants; and be they ever so poor, their poverty, provided it be not caused by any misconduct, is considered no disgrace. It must not be supposed that Paul's father, being a clergyman, was in flourishing circumstances. The income of a pastor, especially in a mountainous region, is very small. Thus we find that our hero's family had begun to feel the want of money, when a happy change occurred. Just as little Paul had attained his twelfth year, the pastor of Schwarzenbach died, and old Richter was appointed to the vacant pulpit.

The schoolmaster in this little town was named Werner, and Paul was placed under his charge. Here he studied Greek, Latin, and Hebrew, took lessons in music, and began to read the literature of his own country. Nothing, he says, gave him such intense pleasure as 'Robinson Crusoe'; and once, when his father was giving a week-day sermon, he hid himself in an empty loft to read it. He had not been long at the Schwarzenbach school before he perceived that his master knew very little more than he did himself, and he resolutely took his education into his own hands. He was assisted in his plans by two young friends, who, admiring him for his zeal and industry, procured books of every kind for him. Paul's thirst for knowledge increased rapidly. It mattered not what the subject of the work was, he read and re-read it until he fully

mastered its contents. He also made extracts; and before he had reached his seventeenth year, he had filled many thick volumes, each of more than three hundred pages quarto. At this time it seems to have been his father's intention to bring him up to the church; and though he could ill afford the expense, he determined to place Paul at the gymnasium at Hof. Accordingly, at Easter 1779, our young hero made his appearance in the great school-room, 'being ridiculed,' says he, 'on account of his rude country garb.' He soon, however, distanced all this ridicule, for he rose to the highest rank in the school, and all his companions were obliged to acknowledge his immense superiority.

During his attendance at the gymnasium, Paul's home was under his grandfather's roof; the situation of whose house, and the comparative abundance of whose living, seem to have had a peculiar charm for him. He appears to have been quite happy while here: but this happiness did not last long; for his father, who had been some time an invalid, died, leaving to Paul the care of his mother, and the task of discharging his debts. Misfortune did not end here: the good grandfather and grandmother soon after breathed their last, within a few weeks of each other; and Paul's mother being their favourite child, received the house at Hof as her legacy. This caused dissension and ill-will in the family, and the other relatives instituted a lawsuit against the poor widow, who had now no other protector than her young son. She determined to leave Schwarzenbach, and to reside at Hof, much against the advice of Paul, who knew how coldly the inhabitants of that place regarded the favoured daughter of the cloth-weaver.

Paul's future life was now decided upon: his mother wished him to enter the church, and therefore sent him to the university of Leipsic, in the mistaken idea that nothing but a certificate of his poverty was needed to procure him admittance to the lectures, and assistance from the professors. On the 19th of May he entered the college, and turned his whole attention to the study of theology. He had gone thither with the false notion that he could live without money; but he had not resided there long, before he found how mistaken he had been.

'I have,' says he in a letter to his old schoolmaster, Werner, 'no acquaintance with either professors or students; I have no free table; no pupils; but do not give up your hopes for me. I will overcome these difficulties; and I hope in time not to need any help. Here is an enigma which I cannot explain, and which I have only darkly hinted at to my mother. I cannot say more till I know whether my expectations are realised. You mention in your letter what impels me to industry—my mother. It is my duty to endeavour to sweeten her life, which has ever been so unfortunate; and by my sympathy to lessen the grief which she feels at my father's loss. I must also do something for the happiness of my brothers; and were it not for this, I should study only what I felt an inclination for.'

All Paul's hopes of attracting the notice of the professors seem to have been vain; his poverty and his modesty were insuperable obstacles; and finding that his greatest wish—that of becoming acquainted with clever men—was not likely to be realised, he turned with renewed ardour and industry to his books. He studied the English and French languages, and also made himself thoroughly conversant with the great authors of those two countries; but amidst all his intense labour, he never seems to have lost, or even forgotten for a moment, his childlike feeling of affection towards his mother.

In December 1781, he writes to her thus:—'I daily hope and expect to receive news of what is passing with you, and also the assistance I have so long prayed for. I wrote lately to tell you that, as I had no funds, I must be trusted: be so good as to give me some counsel. I must eat, but I cannot be trusted any longer: I cannot freeze, but where shall I get wood without money? It is a long time since I asked you

for any, and when it comes, I shall scarcely be able to pay what I owe. Do not think that I would ask you for money unnecessarily. If you can help me now, I trust you will not be called upon to assist me again, as perhaps the project I have will enable me to earn enough for you as well as for myself.'

The scheme to which Paul alludes in this letter was that of becoming an author; an intention which did not meet with his mother's approbation, for she hoped he would follow his father's profession, and that she might have the happiness of sitting one day an attentive listener to his discourses. He endeavoured to remove her objections, and persevered in his intentions. The early history of an author is always interesting, and, we may add, instructive; for though we may not be placed in the same situation ourselves, yet we shall always find some one point which we can apply to our own characters, and which may strengthen us to overcome our own difficulties, of whatever kind they may be. Paul's first work was a satire, which he sent to his friend Vagel, begging his opinion of it. He received for answer, 'I do not praise your folly, but your wonderful wisdom; nevertheless, I fear that if this book be published, nearly all the world will quarrel with you.'

Alas! Paul's hopes were doomed to disappointment. He waited a twelvemonth without being able to dispose of his manuscript; and he says, 'that after it had been returned to him by a professor, he read it again, and rejoiced that it had not met with a publisher.' Nothing daunted, this boy of nineteen again put his pen to paper; and having completed a collection of essays, entitled 'The Greenland Lawsuits,' took courage, and presented himself to the Leipsic booksellers. The work was refused by all; and he sent it to Voss, the great publisher at Berlin. He seems at this time to have been in greater poverty than ever, since he is described as sitting, on the last day of December, in a desolate room, with no fire to warm him, and no food to satisfy his hunger. But a gleam of happiness broke in upon him, when, on the same evening, he received intelligence from Voss that he would publish his work. Who can describe the joy, the gratitude, with which Paul received the fifteen louis-d'ors, the first fruits of his talents and perseverance?

With this money he was enabled to pay all his debts, and to remove from his close, dull room, to a summer-house in a garden belonging to his landlord, where he could study uninterruptedly. At this time every one wore powdered hair and queues; but Paul, partly from necessity and partly from taste, adopted a style very different to the fashion. He says, in a letter to his mother, 'As I cannot make my waistcoats wear any longer, I must go without. My hair has also been cut, as it will save me the expense of a hairdresser. I have a few curls left.'

The landlord of the garden objected to this costume; and after much debate, Paul returned to his old apartment. In 1783, after the publication of his work, he went to Hof to pass the vacation with his mother. The people of this little town do not seem to have valued his book, and he returned to Leipsic, feeling that that was the spot best suited to him, as literature and music were held in high estimation by all classes of society. At the annual fair he sold a second volume of 'The Greenland Lawsuits' to his former publisher, for the sum of one hundred and twenty-six dollars; but for the third volume he could not find a purchaser. His poverty again became pressing, and he had no other alternative than to return to Hof, in the hope that he should be able to live more economically with his mother. He owed some money to his victualler, but he had no means of paying it; and upon the creditor following him to Hof, he was obliged to borrow the money of two friends, named Otto, sons of the evening preacher of that town.

This was the hardest part of Paul's life: his mother had lost her little property by the lawsuit, and was living with her two younger sons in a small cottage,

containing only one apartment. His old friend Vagel came immediately to see him, and supplied him from time to time with books, and even with necessaries. Encouraged by this kindness, he continued to study and to write, earning occasionally a few groschen. About a year after Richter left Leipsic, a college friend named Oerthel returned to his father's residence at Topen, near Hof, and seeing our hero's desolate situation, devised a plan for the improvement of it. Oerthel had a younger brother who needed a tutor, and Richter was offered the post. After some hesitation he accepted it; and on New-Year's Day 1786 removed from his mother's abode to Topen. Unfortunately, neither the elder Oerthel nor his youngest son ever valued Paul according to his merits: the young man's character was not amiable, and had it not been for Madame Oerthel's kindness, and for the friendship of his old schoolfellow, Adam, he would have been really unhappy during his residence in the family. As it was, his spirits and health failed, his gaiety deserted him, and the illness of his friend gave him great concern. At last this friend expired in his arms; and Paul, wearied with his pupil's ingratitude, and having now no tie to the family, returned to his mother's indigent home, not even being able to procure all the money which Herr Oerthel owed to him.

Again he turned his thoughts to his pen; and having produced an Essay upon Death, probably suggested by the recent loss he had sustained, he took courage, and sent it to Wieland, the editor of the German Mercury, through the medium of Herder, who was at that time at the height of his popularity. Madame Herder opened the packet, and having read the essay, was so delighted with it, that she forwarded it to another periodical, with which her husband, at that time in Italy, was more closely connected. Paul did not receive any money for it, but the praises which were lavished upon it gave him encouragement to persevere. He now reformed his dress, and entered more into society, where he was welcomed by all, not only on account of his conversational powers, but also because of his musical genius, which excited universal admiration.

In 1790, our hero was offered the place of school-master at the village of Schwarzenbach; and under the patronage of the magistrates of the district, he entered upon his office. Here Paul seems to have been quite happy and contented. He had for long pondered deeply on the subject of education, and he had now an opportunity of trying the practicability of his ideas. He devoted his whole energies to his employment, and was rewarded by the affection of his pupils and the confidence of their parents. He went every Sunday to Hof, where he always found a party assembled to greet him, consisting generally of young females, whom he encouraged and directed in their studies; in fact he seems to have been both instructor and confessor, which we may account for by the feeling expressed in his own words—'To a man who remembers his mother, all women are sacred for her sake.'

These four years were the happiest of Paul's life: friends multiplied, and poverty began to be unknown. We have already mentioned Christian Otto: he had ever stood a firm friend to our hero, aiding him in his pecuniary troubles, and filling the office of critic, reviewer, and adviser. Not a work went to the press without being first submitted to Otto's judgment; and it was he who advised him to try his fortune again in the literary world. Accordingly, Paul sent his first romance to the Counsellor Moritz, at Berlin, whose daughter was about to marry a famous bookseller there. Moritz was astonished at the genius evinced by the manuscript, and wrote immediately to Richter, saying, that he had found a printer who would give a hundred ducats for the work. We will not attempt to picture Paul's happiness: as soon as he received the money, he hastened to Hof, and gave his mother the shining treasure. His troubles were over: the perseverance with which he had battled against adverse circum-

stances was amply rewarded; his hopes were realised; and, above all, his efforts to rescue his mother from poverty were successful. He gave up the mastership of the school at Schwarzenbach; and having taken his mother from her miserable little dwelling to a cheerful but modest house near his friend Otto, his next care was to repay his old schoolmaster Werner the money which she had borrowed.

The time which he now passed at Hof was a time of nearly unalloyed happiness; but his disappointments were not all over. His romance did not meet with the success he expected; and consequently, when he presented his second work, 'Hesperus,' for sale, he could only obtain two hundred dollars for it. During the following summer he made a visit to Bayreuth, having formed an acquaintance with a Jewish merchant there. Here, to his great surprise, he found his works read and appreciated, and he returned with redoubled industry to his pen. His next production, a novel, drew upon him the attention of all Germany: letters of congratulation poured in from all quarters, but more especially from Weimar, the town in which Goethe, Schiller, Herder, and Wieland, the four greatest poets of the age, were residing. He could not resist the flattering invitations given him, and he made his appearance in that little circle of great men. The Duchess Amelia received him with marks of distinction, and the Princess of Hohenlohe besought him to undertake the instruction of her two sons; a request which he politely refused.

In 1797, Richter found his health so bad, that he was obliged to go to the baths of Eyer, in Saxony; and while here, he received the intelligence that his mother was no more. Overcome with grief, he hastened back to Hof, and had the melancholy satisfaction of seeing her features once again. Among the relics she left her son, was a little book in which she kept an account of her gains by her midnight spinning. 'If all other books were destroyed,' writes Paul to Otto, 'I would keep this, wherein is found the record of her nights of misery.'

We need not follow Richter, step by step, any further. His end was gained: fame and admiration awaited him, although money was still difficult to obtain. In 1801 he married Caroline, the daughter of Herr Von Meyer of Berlin, a woman in every way fitted to be the wife of so extraordinary a man. After his marriage, he settled at Meiningen, and diligently set to work to complete his most famous production—'Titan.' He led a quiet, retired life, for his means were still straitened; and after the birth of a daughter, he left Meiningen, and took up his residence in Bayreuth, where he hired a small house adjoining that of his friend Otto. Here he lived till the day of his death, beloved by all around him. In 1808 a pension of eighty-five pounds was granted to him; and this, together with his own earnings, was sufficient for his comfort.

Nothing remarkable occurs in the history of Richter's life for several years. He generally passed a great part of the summer in travelling, and was everywhere received with marks of respect and admiration. But a bitter blow struck him, from which he never recovered. His son Max was at the gymnasium at Munich, and appears to have been distinguished for his talents and industry. He had unfortunately inherited his father's sensitiveness of disposition, which, having been fostered by early education, settled at last into profound melancholy, and his health giving way, he returned home to die. Richter's spirits sank under this misfortune; and his incessant weeping is said to have brought on the disease which eventually deprived him of sight. In the autumn of 1823, his strength rapidly declined; his nephew cheered his hours of suffering by reading to him; and he had a piano placed near his couch, which he sometimes accompanied with his voice, describing the ideas which floated through his mind as he played. On the evening of the 14th of November he breathed his last, beloved, honoured, and regretted by his countrymen. He was buried by torchlight in the church of

Bayreuth, an unfinished manuscript being placed on his coffin, and an ode by Klopstock sung over his grave. Thus ended the life of one who, however great he may have been in intellect, was still greater from the beauty of his domestic character, his modesty, his humility, and his uprightness. His writings, consisting of poetry, prose fiction, and philosophy, are unfortunately unsuitable to the current of sentiment in English minds, and they must therefore, like most German productions, continue to be little known in this country.

PASSAGE OF THE COL DU GÉANT.

THE passage of the Col du Géant, one of the lofty Alpine points in the vicinity of Mont Blanc, is generally considered by tourists too dangerous to be attempted. In making a journey through Savoy in 1844, I was resolved, however, to make the experiment—the pleasure of overcoming a great difficulty, such as is often experienced by Englishmen, being one of the motives of my enterprise. It was on the 30th of July, while at Chamouny, that I notified to the *chef des gardes* my wish to attempt the passage. He readily appointed three guides to accompany me, and we entertained hopes of being able to start that same afternoon. But the weather in a few hours changed for the worse, and continued very unfavourable, with snow, rain, and frequent thunder, for some days. Without inserting here a meteorological journal for the period of my detention at Chamouny, it will be sufficient to state that, on the 5th of August, the weather towards the middle of the day improved so much, that I decided upon starting at two o'clock, with my guides, for the Montanvert, with the intention at any rate of passing the night there, and of proceeding the next morning for the Col du Géant, should the weather continue fine. Besides the three guides, two of whom had several times made the passage, I was attended by a young man in the character of guide-aspirant, who hoped one day to be enrolled among the regular Chamouny guides. Of course he was not engaged on the same terms as the other three.

We arrived early in the afternoon at the Montanvert, after a very hot walk. Here we found the customary number of visitors of all nations, who had been recreating themselves during the day with the wonders of the Mer de Glace, and were now assembling in various groups, preparing to descend to Chamouny. My arrival so late in the day, with my rather formidable tail of guides, seemed to cause some surprise, which increased when my intentions transpired. However, a good-humoured conversation naturally sprung up, which ended with good wishes being showered upon me from all sides. 'Adieu, monsieur; bon voyage!' said a Frenchman at parting; adding, with as near an approach to a sub-sardonic smile as his politeness would permit, 'Et beaucoup de plaisir!' with which words the last party disappeared down the steep mountain path, leaving me to the avalanches and my meditations. I retired into the little hospice, where I and my guides supped, and betook ourselves to rest betimes. The weather seemed settled, and, if possible, improving.

Before one o'clock in the morning I heard my guides stirring, and soon after we all met, and congratulated each other on the fineness of the weather. The planet Jupiter was shining magnificently over the summit of the Grandes Torasses, and the moon, three weeks old, was just rising over the Aiguille du Dru. I had felt a little uneasy during the night, owing to my having heard some strong gusts of wind; but they had now quite died away, and the silence was unbroken, save by the steady roar of the many small torrents falling from the opposite rocks and lesser glaciers into the Mer de Glace. It was not in the least cold. By a quarter

after two we were on foot; and after half an hour's walk by moonlight, we came to the precipitous face of rock called Les Ponts, a point which we passed without difficulty, after which we were soon fairly launched, and on foot, upon the great glacier itself. We took the route leading to the Jardin, as far as the moraines at the foot of the Couvercle, and then coasted along them as far as the Tacul, where we arrived at half-past four. The sky now appeared of the most exquisite rose-colour over the Couvercle, and of a fine yellow over the Aiguilles Rouges, behind the Flégère, at some distance on the other side of the vale of Chamouny. Once, before it was light, during our progress, one of the guides cut a step or two for us in the ice with the axe that he carried for that purpose, and it was curious to see it strike fire on the gritty surface. At the foot of the Tacul I had some spiked nails screwed into the soles of my shoes.

Here I gazed with renewed wonder, although I had enjoyed nearly the same view before when I visited the Jardin, at the Glacier du Taléfre, and at the Glacier du Tacul, which we were shortly to be busily engaged in scaling. The sun was now shining brilliantly on the highest peaks, there was neither cloud nor vapour visible, and no wind, save a moderate pleasant breeze. Nothing could be more wonderful than the conviction that there were many hours of uncertain labour before us in the passage of the glacier, which from hence, in the clear morning air, appeared so little formidable. The weather was so fine, that the eye was deceived as to height and distance even more than usual.

At about half-past five, on a steep slope of snow considerably above us, under the Aiguille du Grésson, I saw to my great delight a troop of about fifteen chamois. They were not at all behaving like the chamois of the picture-shops—neither tumbling down precipices upon their heads, nor exhibiting themselves in any conventional attitudes; but were making their way, in a file, gently across the snow, one after another, just as you see deer in a park; nor did they appear to take any notice of us.

Hereabouts we came to some ugly crevasses in the glacier, with snow-bridges over them, which had a treacherous look, owing to the snow which fell freshly, and in considerable quantities, only three days ago (on August 2), and which lay thickly on this part of the glacier. In fact we were now beginning to attain a considerable height. Next we came to several crevasses in succession, extending, to all appearance, right across the glacier; these were of a very variable width, so that we readily found places narrow enough to enable us to pass them with ease. By six o'clock we had ascended the glacier, at a guess, to about the level of the Jardin, which we could see at a distance, opposite to us, in its solitude, insulated in the upper part of the Glacier du Taléfre.*

Soon after this we got into the heart of the Glacier du Tacul, and Alexandre Devonnassond went ahead of us all to explore the way. Here we came to some really bad places, which we passed with care and patience, and not without a sensation of horror on seeing a mass of ice roll from above, and disappear with a thundering crash. Hurrying forward with all possible care, we at length got some breathing-time on a small plain of snow; and afterwards, for a little while, continued our progress up the glacier without having to encounter any bad crevasses: we were aided too, rather than impeded, by the new-fallen snow—the softness of which took off the danger that would otherwise have existed of slipping upon the ice. Hitherto our progress had been very slow, and we had been obliged to make many countermarches, so that it was now past seven o'clock.

I will observe, by the way, that it is quite impossible

* According to Professor Forbes, the height above the level of the sea of the lowest part of the Jardin is 9042, and of the highest part, 9893 English feet.

for the most extravagant pencil to exaggerate the outlines of glacier scenery—it's wild fantastic forms, icy cliffs, crags, pyramids, pillars, and huge projecting masses, all making up an extraordinary study for the artist.

Soon afterwards, in consequence of our coming to a very bad crevasse, Devonassond was again sent out to explore a passage in one direction, and Coutet to explore in another, leaving me and the two others together. Here a large wasp, apparently puzzled like ourselves, came buzzing round and round us. We were at fault here for some time. At last a very narrow bridge of ice was seen at some little distance, which, by its darker colour, appeared to be old ice, and therefore, by comparison, firm. This bridge, if such it may be called, lay on our right, many feet above us, and the question was, how to reach it. Devonassond, with admirable coolness, yet running risks, as I thought, which made me feel almost faint with anxiety as I witnessed them, managed, by the help of steps which he cut with his axe in the solid ice, to scramble up to the base of a small column of ice that communicated with a sort of platform, on which there was firm, though scanty standing-room, and from whence the bridge might be immediately reached. The ice-column looked insecure, and the more so from the quantity of brilliantly-white fresh-fallen snow that had lodged against it. Its firmness, however, was put to the proof by blows with an ice-pole, and it was partially cleared of the fresh snow. Devonassond then cautiously cut steps round its exterior surface, and so ascended to the platform, followed by another guide, who held one end of a strong cord, the other end of which was tied round my body. I then followed them. The two guides, now firmly placed on the platform, held the cord slackly, not intending to use it unless it was required. It was agreed that they should tighten it if I called out to them to do so, but not else. Thus I wound my way, in the footsteps of those who preceded me, carefully round the column, with literal precipices and yawning gulfs of ice, formed by crevasses intersecting crevasses in every possible direction, beneath me; steadying myself with one hand as I walked, and holding the cord loosely between the finger and thumb of the other, like a child who learns to walk alone by holding up its frock before it—for confidence in the succour at hand was the only support really required. The other two guides followed me. We then all crossed the narrow bridge of ice without difficulty; and, descending by a low, yet perpendicular cliff of ice, we resumed our line of march, leaving this formidable intersection of crevasses behind us. It was now eight o'clock. Soon after this, the glacier changed its appearance altogether. As we ascended, we found more fresh snow, and fewer crevasses; but there was still great need of caution. Here we all tied ourselves together with two stout cords, and proceeded for half an hour more, until we came to a convenient place for halting, where we stopped, and took some breakfast, having had a laborious walk of more than six hours from the Montanvert, almost entirely over ice.

Here I accidentally let fall on the snow the case of the green spectacles I wore on this expedition. It immediately began to glide away, as if animated, and disappeared down a crevasse, at about eighty yards below us. Nothing is safe for an instant if not well-looked after on these treacherous slopes. In order to prevent a like mischance happening to our poles, the loss of any of which would have been a serious matter, we took care never to let them out of our hands without first sticking them firmly upright in the snow by their pointed ends.

Whilst we were in the middle of the glacier, I could not help remarking what ridiculous figures we all were, equipped with blouses, frieze gaiters, green spectacles, vells, and slouched hats, pacing along with the most solemn gravity. The journey had made us very hungry, and we fell to our repast with excellent appetites, after which we resumed our line of march exactly as before. At a quarter before ten we came on the fresh track of

more chamois, but we saw none. Mont Blanc now appeared on our right, in a rocky opening by the side of the glacier, astonishingly diminished in height, and apparently close to us; yet in reality it was more than six thousand feet above us, and on that side wholly inaccessible. From hence we pursued our course up a long and steep ascent of snow, in one monotonous zig-zag, interrupted only by our sinking knee-deep into the soft snow, and by the countermarches it was necessary to make in order to find snow-bridges strong enough to bear us across the crevasses with which the snow was at this height intersected. Some of these bridges had a downward, and not an upward curve; fringed with icicles many feet long. Such bridges as these we carefully avoided. In many places we saw creases in the smooth snow, under which we found incipient cracks and crevasses of a few inches only in width, that seemed to show that these wonderful regions were in a perpetual state of lapse and change, so that in all probability no two journeys across them can be made under similar circumstances. We appeared to have got out of our main difficulties quite as suddenly as we at first got entangled among them. And now the bare outline of the Col seemed to lie just before us; it was not, however, until after nearly another hour's labour over the inclined plane of eternal snow, glacier no longer, that we actually found ourselves upon the ridge (according to Forbes), 11,142 feet above the level of the sea: having attained our point not without some hard work, and undergoing some risks, but without sustaining any painful degree of fatigue, and without experiencing any ill effects whatever from the rarity of the air; symptoms of which may always be expected to be experienced as soon as an elevation of ten thousand feet is attained. The cool, silent precautions of my guides throughout were beyond all praise.

But it is not desirable, and it is scarcely possible, to remain long on the uppermost ridge. You must make immediately for the rocky buttress on which De Saussure's cabin stood. In order to attain this spot, you pass a very dangerous steep slope of snow, terminating abruptly in a precipice on the summit of the glacier of Mont Fréty, on the side towards Piedmont. In crossing this slope, the new-fallen snow stood us in good stead. It was exactly of the proper consistency for walking upon safely and easily; nevertheless, it appeared to me to be a place where, in some states of the weather, an avalanche might easily be detached, that would carry all before it and with it to destruction. Devonassond told me that on one occasion, on passing this spot, he found it an entire sheet of ice, so that he was obliged to cut steps right across its whole length in order to reach the rocks. These, however, we now attained without difficulty; and on arriving, we congratulated one another on the entire success that had, up to this point, attended our expedition, and commenced a vigorous attack upon our remaining provisions.

Here, then, we were fairly stationed upon the summit of the Col du Géant, at a height, as I have before stated, of more than eleven thousand feet above the level of the sea. From this point the view to the north is quite shut out; but on turning to the south, on your right hand, is the summit of Mont Blanc, with its dependent glaciers, and awful buttresses and outworks; in good truth, a most sublime and astonishing sight! Below, lies the Allée Blanche; farther, amidst a wilderness of alps, not fewer than five enormous peaks of mountains, apparently little lower than Mont Blanc, and of outlines to the full as grand; nearer rose the Cramont and the Pain de Sucre, hard by which was the little town of Courmayeur, with the adjacent valleys; and thus, not to catalogue the remaining mountains, the eye passed eastward towards Mount Rosa, and the glorious Cervin. Most fortunately there was no haze or vapour to intercept the wonders of the view; there were only a few white clouds here and there, rather setting off than marring the proportions and magnitudes of the mountains before us, infinite in number and majesty. In

fact no description can convey anything like an adequate idea of this side of Mont Blanc, and of the appearance of the descent, our destined route, from the summit of the Col du Géant towards Courmayeur.

Whilst gazing at the view, our attention was arrested by a hissing sound, which we found to proceed from the snow on a very long and precipitous slope to our right, the surface of which, under the influence of the noon-day sun, began to slide in gentle avalanches down towards the rocks beneath. We immediately, merely for the sake of amusement, commenced hurling stones, as large as we could lift, down the slope, in hopes of augmenting the avalanches; but it was wholly without effect. The velocity, however, which these stones acquired before they reached the bottom of the slope, and the force with which they dashed against the rocks below, bursting asunder in clouds of dust, was a striking sight. Two of my party succeeded in detaching a very large mass, which rolled down with prodigious violence, but it had no more effect on the snow than the smaller ones.

Some of the boards of De Saussure's cabin, before alluded to, still remain on this spot. Here it was that, in his devotedness to science, that distinguished philosopher passed seventeen days and nights. The debris of rock here contain a vast quantity of crystals. Here, too, we picked up the broken stem of a thermometer. We also saw several butterflies whilst we remained on the summit. We had, earlier in the day, seen several dead and dying insects on the surface of the snow, and one or two dead half-fledged birds.

We remained on the summit of the Col until a quarter before one o'clock. I forgot to note the exact time of our arrival, but I think we remained on the summit nearly two hours, enjoying the uninterrupted calmness and beauty of the weather. We now commenced our descent towards Courmayeur. Our way lay down a long precipice of loose rocks and stones, fortunately free from snow. This descent, together with a glissade of snow much lower down, and after that a steep descent of rude mountain pasture, occupied us, without intermission, until past three o'clock, when we made another halt at the tail of a snow-slope, from under which there issued a delicious clear stream of ice-cold water. Here we finished what wine we had with us, and congratulated each other sincerely on the success of our expedition, for now all difficulties were past; and I will not deny having looked up at the frowning battlements of ice, on which we had been so lately standing, with the most exhilarating sensations.

During the descent, I was much struck with the towering magnificence of the Mont Velen, which I had seen in great beauty when on an excursion to the Great St Bernard a fortnight before. The beauty of the scenery below, about Courmayeur, as seen during the descent, exceeds anything which the vale of Chamouny affords.

Other steep pastures, fir-woods, and a succession of sloping green meadows, led us finally down into the vale of Courmayeur at a quarter past five. Here, just as we had reached the bottom, although I felt in no respect unpleasantly fatigued, I was attacked by a giddiness so sudden and violent, that I fell against a young ash-tree, and thence headlong down a soft grassy bank. My guides, in alarm, ran to my assistance, and in less than a minute I was perfectly restored; nor was I in the least hurt by the fall. This kind of attack I had never before experienced. I have no doubt but that it was occasioned by changing the air of the glacier, and of the mountain, for that of the valley, which we all found very hot and close. I continued my walk with great caution for a little way, being apprehensive of a return of the seizure; but finding that, on crossing a narrow wooden bridge over a foaming torrent, I could stand and look at the troubled waters without inconvenience, I dismissed the subject from my mind, convinced that the indisposition was merely transient. And so it proved. We at length reached Courmayeur at six

o'clock, having been on foot fifteen hours and three-quarters. In the evening I experienced a very slight bleeding at the nose. I slept well that night, and the next morning felt little or no remains of fatigue.

There is no part of the passage of the Col du Géant, from Chamouny to Courmayeur, that is extraordinarily fatiguing; though the glacier is sure to be in a state more or less dangerous, and the summit of the Col, towards Courmayeur, may be in a very dangerous state indeed. The excitement is unceasing, and the attention perpetually occupied. I have been very fortunate in all my mountain excursions, and have been well rewarded for paying a little patient attention to the turns of the weather. We had scarcely arrived at Courmayeur, when dark clouds began to gather round the summit of Mont Blanc, and soon after enveloped the Col du Géant; and at dusk it came on to rain heavily, with thunder and lightning.

With respect to passing the Col du Géant, I think, on the whole, it is better to go, as we did, from Chamouny to Courmayeur, than from Courmayeur to Chamouny. It may be a question, in case of bad weather, which is the better place of the two to be detained at: but at Chamouny you are sure of getting good guides at a short notice; and if you intend starting from Courmayeur, you must send round to Chamouny for a guide to be the leader of the party, and must keep him with you till you start. Also, on the Chamouny side, in passing the glacier, you are going up hill all the way, whereby you obtain a better sight of your chief difficulties, which also you thus encounter early in the day's work. But, on the other hand, should the rocky precipice on the side of Courmayeur have any snow upon it, the ascent of it would probably be better than the descent. However, in such a case, it would perhaps be the more prudent plan to defer the expedition altogether.

The next morning, August 7, was fine after the rain and thunder of the night; but we observed that fresh snow had fallen on the heights, and that the precipitous rocky descent from the Col was now gray with snow; so that had we delayed our expedition a single day, it would in all probability have failed. At eight o'clock I left Courmayeur with my guides, and proceeded by the Col de la Seigne to Chapice, a wild little mountain village, our quarters for the night. We were scarcely housed, about dusk, before a thunder-storm came on; during which I saw, by a blaze of lightning, three children of the hamlet sitting on the grassy slope of the mountain, not heeding the weather, and no one heeding them. The rain at last drove them in. One had a bowl of milk in his hand, and another a wreath of Alpine flowers. The next morning we went on by the Col du Bon Homme to the baths of St Gervais. Here I bade farewell to my trusty guides, shaking them all four cordially by the hand at parting. They were of course going home to Chamouny. I went on to St Martin, and the next morning returned by the diligence to Geneva.

MUSIC OF FISHES.

Aquatic animals are generally supposed to be destitute of the means of making themselves heard; and if they communicate with each other, it is usually supposed that it must be otherwise than by sound. The seal has, it is believed, a peculiar and distinct cry; and the grampus snorts as it attains the surface. Frogs, and other amphibious animals, croak long and loud enough; but in all these cases the sounds are emitted, not under, but above the water, and by creatures rarely more than half-aquatic. The cetaceous races have warm blood, and suckle their young; and fishes, properly so called, are considered, as we shall presently show, erroneously a silent race. The long-eared Balaamite is justly reckoned the strangest as mentioned in history; and a scaly creature emitting sounds may truly be reckoned a very odd fish indeed. A party lately crossing from the promontory in Salsette, called the Neat's Tongue, to near Sewree, were, about sunset, struck by hearing long distinct sounds, like the

protracted booming of a distant bell, the dying cadence of an Æolian harp, the note of a pitchpipe or pitchfork, or any other long-drawn-out musical note. It was at first supposed to be music from Parell, floating at intervals on the breeze; then it was perceived to come from all directions almost in equal strength, and to arise from the surface of the water all around the vessel. The boatmen at once intimated that the sounds were produced by fish abounding in the muddy creeks and shoals around Bombay and Salsette: they were perfectly well known, and very often heard. Accordingly, on inclining the ear towards the surface of the water—or, better still, by placing it close to the planks of the vessel—the notes appeared loud and distinct, and followed each other in constant succession. The boatmen next day produced specimens of the fish—a creature closely resembling in size and shape the fresh-water perch of the north of Europe—and spoke of them as plentiful, and perfectly well known. It is hoped that they may be procured alive, and the means afforded of determining how the musical sounds are produced and emitted, with other particulars of interest supposed new in ichthyology. We shall be glad to receive from our readers any information they can give us in regard to a phenomenon which does not appear to have been heretofore noticed, and which cannot fail to attract the attention of the naturalist. Of the perfect accuracy with which the singular facts above related have been given no doubt will be entertained, when it is mentioned that the writer was one of a party of five intelligent persons, by all of whom they were most carefully observed, and the impressions of all of whom in regard to them were uniform. It is supposed that the fish are confined to particular localities—shallows, estuaries, and muddy creeks, rarely visited by Europeans; and that this is the reason why hitherto no mention, so far as we know, has been made of the peculiarity in any work on natural history.—*Bombay Times*.

FACTS ON THE POST-OFFICE.

At an entertainment lately given at Manchester to Mr Rowland Hill, the originator of the penny postage, some remarkable statements were made by that distinguished benefactor of his country. 'He wished,' he said, 'to convey to his hearers some idea of the magnitude of the institution. Were he merely to state that so many millions of letters passed through the Post-office in a year, no one could form any accurate conception of the reality. The best mode, probably, to convey any idea of the whole, would be for him to describe some part. For instance, last night when he left London, he was at Euston Square when the mail was brought in to go by the train—this being only one of many which are despatched by railways. It was considered an exceedingly light mail; but small as it was, it literally filled six large omnibuses; and the heavy mails forwarded on a Saturday night filled nine carriages of a similar description. Again, the number of dead letters, since the adoption of prepayment, had become a very small fraction—less than the 200th part of the whole; nevertheless the average amount of money found in such letters, in coin, bank-notes, and bills of exchange, was £400,000 per annum. Many thousands of pounds were actually found in letters with no address whatever. It might seem to many absurd that letters should be carried past a town for which they were intended, and then brought back; but it was not really absurd. It arose from the impossibility of every town making up a bag for every other town. There were about 1000 post-towns, and if every one of these made up 1000 bags, there would be 1,000,000 bags; in fact, more bags than letters. It had often struck him that some pains should be taken to make the main features of the Post-office system intelligible to the people. There was no department of government which came so much into contact with the people, and it was advisable that they should know what arrangements were capable of improvement, and what were not. Perhaps it might be interesting to the company to revert to a few facts connected with the change produced by the plan of penny postage. Immediately before the introduction of the reduced rate of postage, the number of chargeable letters—not including franks—delivered amounted to 75,000,000 annually. Last year it amounted to 299,500,000, or to fourfold the original number. It would require something more than that to bring the Post-office revenue up to the former gross amount; but less than fivefold would effect that object. At the present moment, the number of letters delivered in the London district, com-

prising a circle of a radius of twelve miles round the Post-office in St Martin's-le-Grand, was quite as great as that which, under the old system, was delivered in the whole United Kingdom. The increase was rapidly going on, and amounted to 28,000,000 more last year as compared with the previous year. It was the opinion of many gentlemen that the introduction of the penny rate increased the difficulty of effecting improvements. It was said they could not afford to give cheaper postage and greater facilities also; but in fact improvements had followed one another more rapidly since the penny postage came into operation than before. When the plan was first proposed, the large towns had only a single mail connecting them with London; now they have two mails per day. Again: in England and Wales there were formerly only 2000 post-offices of every kind; now there were 4000. There was a growing conviction in the minds of all connected with the Post-office, that to make the establishment profitable, they must make it as useful as possible, and to that great object his efforts should be devoted.'

THE SWING.

UPWARD she wings her flight afar,
A bird amid the quivering bowers;
Then, shooting downwards like a star,
Just skims the dew, and stirs the flowers.

One moment, like the huntress fair,
She stoops to kiss Endymion's eyes;
The next, rebounding in the air,
Shoots Parthian arrows as she flies.

Love-banished, and recalled by love,
She paints the passion false and vain:
Yet no; for though she seems to rove,
She still obeys the master's chain.

Now on the earth, now in the air,
Now won, now lost, her fleeting charms;
Gliding aloft, a phantom fair,
Then pressed an instant in my arms:

Ah! cease, dear wayward girl, to fly,
And from thy wild vagaries rest;
Leave, leave the angel in the sky,
And give the woman to my breast!

L. R.

THE ROUND TOWER.

A SONNET.

In London, queen of cities, you may see,
Facing the lordly house of Somerset,
A goodly tall round tower. Its base is wet
With Thames' fair waters rolling quietly.
Who was it built this tower? what may it be?
Say, was it piled by Druid hands of old?
Or reared by Eastern Magi, there to hold
The sacred flame, type of their deity?
Was it a hermit's calm retreat? or pile
Where hung sonorous the resounding bell?
Or is it such as in green Erin's isle
We see, whose uses nobody can tell?—
'Twas answered, 'Who 'twas built it know I not;
But 'tis, I know, the Tower for Patent Shot.'

—*Old newspaper*.

CHARACTER OF UNHEALTHY DISTRICTS.

All these districts have the same character. The streets are narrow, badly paved, badly cleansed, and badly drained; the houses ill-constructed, without the means of cleanliness and decency, over-crowded and unventilated; and, as a consequence, the streets are covered with filth, and the houses full of impure air. The condition of the streets and houses generates filthy habits, and the habits once formed, react upon, and exaggerate the state of things to which they owe their origin; till at length filth, disease, destitution, and crime, come to dwell together as natural and inseparable companions.—*Sanitary State of the Metropolis*.

HISTORICAL TABLEUX.

SERFDOM.

A READER of history is startled with no fact more curious, or more suggestive of melancholy reflections, than this: among every people aspiring to the rank of a nation has there been a tendency to a condition of slavery—slavery less or more modified, according to circumstances, but still, in any of its forms, a condition of personal degradation and dependence. Accustomed in the present day to associate ideas of injustice and violence with the condition of slavery, we are naturally disposed to imagine that slavery in all ages must have been maintained exclusively by force. Violence no doubt has been mainly a cause of slavery; but history demonstrates, by unchallengeable evidence, that, in numerous instances, it has also been a voluntary condition—a condition into which men have peacefully gravitated, and actually chosen in preference to liberty. In pretty nearly all modern dissertations on slavery, this latter fact has been somewhat disingenuously kept out of sight, possibly from a well-meant desire to do no damage to the cause of slave emancipation. We think it consistent with a truer morality to look the truth unflinchingly in the face; humanity, as we conceive, being always best served by a fair representation of facts, and the philosophy which can be drawn from them.

The oldest record on which reliance can be placed is the Bible—a work, it is to be presumed, in every one's hands. If we peruse with even moderate diligence the historical portion of that ancient record, we may observe, from various passages, that in the patriarchal and subsequent ages slavery was an institution regulated by express injunction. The Hebrews were to have no sort of scruple in buying or selling strangers. 'Both thy bondmen and thy bondmaids, which thou shalt have, shall be of the heathen that are round about you; of them shall ye buy bondmen and bondmaids. Moreover, of the children of the strangers that do sojourn among you, of them shall ye buy, and of their families that are with you' (Lev. xxv. 44, 45). With respect to the buying and selling of each other, however, this ancient people were placed under some kind of limitations. If a Hebrew bought one of his own nation, the slave was to serve him only seven years, and receive certain presents at departure; but if it happened that the slave, from affection to his master, would not leave him, then he was to be kept in perpetual bondage. The ceremony on such occasions is distinctly prescribed: 'Then thou shalt take an awl, and thrust it through his ear unto the door, and he shall be thy servant for ever; and also unto thy maid-servant thou shalt do likewise' (Deut. xv. 17).

The tenure by which personal freedom was held was

exceedingly slight all over the East. Liberty might at any time be forfeited by impoverishment, or any other misfortune; and so little was it prized, that men did not scruple to gamble away their entire property in themselves and their families. In the infancy of institutions, buying and selling are the ready methods of negotiating a thousand intricate transactions. Contracts of various kinds resolve themselves into a matter of exchange. We accordingly find that, in all ancient marriages, the symbol of buying and selling was introduced. Every man obtained his wife for a certain quantity of goods or money, or, as in the case of Jacob, for a length of servitude. And till this day, in most rude nations, the same practice prevails. Among the North American Indians, a wife is purchased by a present of peltry, and other articles suitable to the fancy or necessities of the seller.

In ancient times, inability to pay a debt was a fruitful source of slavery. In the narrative of events recorded in the fourth chapter of the second book of Kings, an affecting story occurs: it is that of a poor widow, whose children are about to be taken from her, and carried into slavery, in liquidation of an unpaid debt of their father. In the woman's despair she comes to Elisha, and after telling him that her husband is dead, adds that 'the creditor is come to take unto him my two sons to be bondmen.' The prophet, it will be remembered, interposes to prevent this calamity, by multiplying her vessel of oil, out of which she is desired to pay the demands of her ruthless creditor. From this simple fact, it would appear that people who could not pay their debts became, with their families, the property of their creditors. The seizure and sale of the person was, in all probability, the only available means of settling a claim of this kind; the law threw no mantle of protection over the liberty of the unfortunate debtor.

The readiness with which large masses of men became the property of wealthy owners, accounts in a great degree for the large public works of ancient times. What was wanting in capital and science was made up by the animal force of slaves. All the huge stones for building the Pyramids were dragged on sledges, from distant quarries, by long rows of men, yoked together with cords, and impelled to exert their utmost strength by attendant companies of soldiers. The raising of these blocks to their respective places was likewise effected by bands of slaves pulling at ropes attached to rude mechanical contrivances. In the Great Pyramid of Cheops there are six million tons of stone, piled on a surface of eleven acres, and rising to a height of four hundred and sixty-one feet. A steam-engine could have elevated the whole mass without a single pang to a human being. But, according to Herodotus, relays of a hundred thousand slaves toiled for twenty years in raising the stones to their places. The sacrifice of

life was enormous, but the gaps made by death were speedily filled up with new victims. The expense for labour was a trifle. The slaves, in all probability, cost nothing; there is even reason to believe that they resigned their liberty, and undertook these horrid services, for the sake of subsistence, although their fare was only a handful of dry beans.* Some light is thrown on the methods for securing slave service in the history of Joseph.

It was while the Pharaohs were engaged in their stupendous undertakings that Joseph, a poor Syrian boy, bought by Potiphar from the Midianite merchants, rose to consideration as a domestic slave in the royal household. Having attained the position of prime minister, a dearth ensues in the land; and how does his sagacity meet this disaster? By a provident foresight he stores up an abundance of corn in granaries, and sells it out to the people during the scarcity. But the first year exhausts their stock of money, flocks, and herds; all that they have is given for food. At the second year of dearth, therefore, they come to Joseph, and in desperation offer themselves, with their land, in exchange for subsistence. 'Wherefore shall we die before thine eyes, both we and our land? Buy us and our land for bread, and we and our land will be servants unto Pharaoh.' Joseph, no doubt expecting this climax, buys the people, and removes them to cities appointed for their reception, to which movement no objection appears to have been made. 'Then Joseph said unto the people—Behold, I have bought you this day, and your land, for Pharaoh: lo, here is seed for you, and ye shall sow the land' (Gen. xlvii. 23). At a single blow, this clever foreigner had reduced the free population of the country to the condition of serfs of the crown—a condition as nearly as possible that of the agriculturists of Egypt in the present day under Mehemet Ali.

From similar glimpses of Grecian and Roman history, we learn that the abject poverty of the people made them thankful to resign their liberty, and become the bond-servants of opulent masters. In the latter days of the Roman empire, the great bulk of the population in Rome were mere hangers-on upon great men. Without a will of their own, or any means of individual enterprise, they gladly submitted to be the property of some one who would feed them. So also through what are called the middle ages, which succeeded the dismemberment of the Roman empire, we find a condition of slavery universal. The church, it is true, successfully interposed to prevent the open sale and deportation of human beings on the rude scale which had been formerly practised; but this only modified, without extinguishing, the principle of slavery, and the condition of dependency which ensued did not essentially differ from that which had prevailed among the Romans. Like circumstances produced like results. There was no diffusion of capital, no scope for individual exertions, no safety but under the protection of a chief. For many centuries, therefore, in England and Scotland, the peasantry, according to law and usage, were the fixed vassals, villeins, or serfs of barons, who gave them food, shelter, and clothing, in exchange for their services in peace and war. Necessity had thus not a little

to do with the slavery of the middle ages. To a poor man there was no choice between bondage and starvation, unless, indeed, he preferred the precarious life of an outlaw and robber. Nor did the bondage generally assume a harsh character. It was for the interest of a lord to take some degree of care of his vassals; and the expectation of living and dying in the same spot was considered a boon cheaply purchased by the resignation of independence. In sales of property, the vassals were disposed of, along with the lands and houses, to the new owner; thus, in deeds transferring property in the twelfth and thirteenth centuries, the words '*cum nativis, et eorum sequela*' (with the natives, and their succession) frequently occur; and it is no unusual stipulation, that the purchaser shall not dismiss the bondmen into a state of self-dependent freedom.*

The gradual dissolution of feudal usages, and the advance of popular rights, along with a general improvement of means, put an end to villeinage in Britain, though it is historically interesting to know that, within the last hundred years, men with their families were sold as pendicles of property in Scotland. We allude to the last fragment of legal serfdom in the British islands, as it existed in relation to the operative salt-makers and coal-miners. In justice to these men, it should be mentioned that they manifested no reluctance to receive their freedom; but the same thing cannot be said of the clansmen in the Highlands and Isles on the abolition of the heritable jurisdictions in 1748. They desired no civil privileges; they would have greatly preferred a perpetuity of feudal dependence on their chiefs; and old associations, along with their connexion with the soil, were not dissevered without violence. The truth is, the poor people's minds were *etiolated*. They had not the vigour for self-reliance, and required some one to think and act for them.

After long ages, civil equality was established in England; every man was declared to be free, and to be the absolute proprietor of his own person. This freedom, however, was not an unmixed good. In proportion as villeinage disappeared, mendicancy increased; and so great did this new evil become, that the state was obliged to institute a modified species of serfdom, under the title of a poor-law. By this, as finally arranged in the reign of Elizabeth, the poor, no matter what their mental or physical condition, once more established their right to maintenance out of the lands on which they were born. It was practically a villeinage without sale. For the baron, was substituted a parish overseer; and for the word vassal, might be read pauper. The pauper could not be disposed of like a beast of burden; but he could be compulsorily worked in exchange for the food and shelter to which he was driven or voluntarily clung.

There the matter rests. At present, the expense incurred for the poor in England amounts to about six millions annually (£5,039,703 in 1845); but this is independent of a vast number of charities; and were the dispensation of funds on a similar scale in Ireland and Scotland, the yearly cost of the poor in the United Kingdom would probably be not less than ten millions. The actual outlay in the present year, it is believed, will be twenty millions.

* A similar act of oppression was perpetrated by Peter the Great of Russia, when he caused the erection of St Petersburg. The work was compulsorily executed by serfs, who were wretchedly fed, and slept in the open air on the damp ground. The building of the city, it is calculated, cost the lives of upwards of three hundred thousand men. This event occurred in Europe within the last hundred and fifty years.

* Merville, who died in 1189, minister of William I. of Scotland, granted to Henry de Saint Clair the lands of Hermendston in Mid-Lothian, with two bondmen, Edmond the son of Bonde, and Gilles-michael his brother, with their progeny, on this express condition, that they should not be removed from the lands.—*Diplom. Scotie*, pl. 75.

Out of all this recital of facts, a humiliating confession is wrung. Civilisation has been as unsuccessful in preventing the growth of pauperism within the bosom of society, as ever barbarism was in avoiding the institution of slavery. Three thousand six hundred years ago, Joseph stayed the horrors of dearth by making the people serfs; England, to all appearance, can think of no other means of averting starvation, than by making the people parish paupers; that is, dependents on the land. While many millions of persons are dropping out of the ranks of independent labourers, and swelling the lists of the destitute, the talk is only of improved poor-laws: which signifies an extended encroachment on public means.

From the facility with which masses of men relinquish habits of independence for the sake of mere creature support, it would appear as if there was a proneness to slavery in human nature which can be eradicated only by culture, and a concurrence of happy circumstances. The disappearance of feudalism, and the gift of personal freedom, along with the security of property, have unitedly raised Britain to a high pitch of glory. In no country in Europe is labour better remunerated, or skill and industry so sure of their reward. The progress of the humbler and middle classes has been correspondingly great; thirty millions of money in savings' banks, and some thousands of benefit and assurance societies, testify a prodigious advance in habits of foresight; while the extensive enginery at work to instruct and refine, gives promise of a condition of things much more satisfactory than now exists. At the same time, it is painfully evident that society, with all its increasing opulence and intelligence, does not rid itself of the tendency to vassalage and pauperism. We cannot but consider this a curious phenomenon; and did we despair, as some do, of civilisation, we should, from appearances, acknowledge that history goes on in a circle, and brings a state of refinement round to the necessities and institutions of barbarism. The phenomenon, however, is incidental, not natural. Feudal usages have bequeathed to all classes the disposition to worship rank, by what may almost be called a blind instinct. This is strikingly manifested in the elections of members of parliament. On these occasions, not alone the peasantry, who may be held excused in their half-enslaved state, but the largest and most intelligent communities, are seen voluntarily committing the management of their affairs to parties not the most suitable on general grounds, but because they possess a title, or some other qualification equally aside from the duties which are to be performed. A similar species of subserviency pervades all the higher seats of learning; of which no more conspicuous example could be given than the late exaltation of a prince—merely because he was a prince—to be chancellor of the university of Cambridge. Phrenologists, I suppose, would call all this a large development of Veneration. If things are to be called by their proper names, it is a lingering principle of serfdom—a spirit of grovelling and detestable meanness.

Where men, opulent and learned—perhaps we can hardly say educated, in the true sense of the word—are found cherishing feelings as grotesque as they are unreasonable, we have the less occasion to wonder at a disposition in the uneducated masses to lapse back into habits of feudal dependence. Vast numbers are poor by inheritance, and having grown up a three-fourth idle class, they naturally cling to the soil on which they have been cradled; and as the poor-laws, with false benevolence, strengthens the traditional attachment,

serfdom amongst the rural population seems but the effect of a natural, though in reality an artificial, cause. While it is a leading principle in the poor-law to fix each man to his parish, a bounty may be said to be held out for the continuance of a qualified rural vassalage.

This, however, must have an end. We see it coming. The natural energies of society and powers of self-rectification have not hitherto had fair play; they have been obliged to contend with all sorts of difficulties, the relics of a feudalism, dissipated only in name and a few of its forms. Nor is it in a frantic resumption of feudal obligations in all their mediæval integrity, as some would seem to argue, that the miseries of poverty are to be averted. Englishmen have not yet fallen so low as to wish to be slaves, in order to be insured their daily bread. Popular feelings, left to their free demonstration, would seem to point in a contrary direction; and humanity might be more graciously employed than in encouraging fallacies which are repugnant to the spirit of independence. What we desiderate is justice, not charity. Freedom in commercial intercourse has already been accorded, though as yet its benefits can scarcely be said to be visible. An abolition of the laws of entail, the unembarrassed sale and transference of land (out of which would arise a better system of tenancies and cultivation), the constituting of the whole United Kingdom one great parish as respects the poor, colonisation on a large, a continuous, and systematic scale—are all so many additional means which the generation now growing up will have the fortitude to adopt for the relief of the country. Neither have we reason to despair of eradicating much of the tendency to pauperism in urban populations. It can doubtless be said, with too much truth, that there are large masses of men whom prosperity does not bless—that the fruits of labour only furnish means for dissipation. But to charge this entirely to the score of human nature would be manifestly unjust. In other countries, where refined taste and harmless mirthful recreation have not for ages been proscribed, we see no such consequences. A consciousness of this fact is dawning on Britain; and in the ameliorations already effected, we have no unreasonable hope that foresight will increase along with a general improvement in the tastes and habits of the people. What might not be achieved by education alone, were common sense, instead of the miserable prejudices of party, to be allowed the ascendancy!

The contingencies of human affairs will ever, unfortunately, create a certain amount of dependent poverty; but that millions of beings, able-bodied, and not deficient in intellect, should accumulate in a hopeless species of serfdom, burdensome to society, betrays a woful want of statesmanship, and is an impeachment of the national understanding. Without dreaming of a Utopia, we can conceive a state of things in which a far higher and more diffused civilisation than the present will exist, and with which the spirit and practice of vassalage will scarcely find itself congenial. Nature has no deliberate design for the maintenance of slavery. But she unequivocally demonstrates what men may very easily become, morally and physically—by neglect and misuseage, gravitating nearly to the character of brutes; and by culture and favourable circumstances, ascending to a condition only a little lower than the angels! History, religion, observation, everything enforces this everlasting truth. Man must elevate himself. His Creator has most graciously pointed out the means by which he may soar to Heaven!

W. C.

THE LAMETER.

AN IRISH STORY.

NUMEROUS have been the stories about Irish weddings—the heedlessness with which they are undertaken, the frolics, fights, and follies with which they have been too often the occasion. I believe, however, there is room for one story more. At all events, it is one I picked up in the country, and I give it pretty much in the language of the narrator, a lively middle-aged lady, whom I met at a party one evening in Cork.

Last summer—proceeded the lady—when I was on a visit to the seat of my cousin, Captain Johnson, in the county of Wicklow, the family was a little amused with a queer sort of wedding which took place in the small town in the neighbourhood: it was the marriage of one of the servants, and we therefore took some interest in the affair. My cousin, you must know, is a great improver—none of your old set of squires, who let things go to wreck and ruin. The estate was dreadfully incumbered when he succeeded to the inheritance, but he soon put everything to rights, and now keeps a first-rate body of servants to execute all kinds of farm-work. The estate is partly hilly and pastoral, so he has a cowherd to take care of the cattle. This cowherd, Garritt Byrne by name, was a rather good-looking young man, with a long frieze coat and capacious capes, and he usually carried a very sufficient-looking cudgel, which I daresay he knew how to flourish in proper style.

Garritt, I found, was a kind of favourite. His mother had been a nurse to some of the family at the Hall, and this gave him a claim to consideration. Whether from having been a little bit spoiled from this cause, I cannot tell, but Garritt had grown up somewhat self-conceited, and took things rather easily, even when they concerned his own welfare. But this of course is not very uncommon among us Irish. Be this as it may, Garritt on one occasion got himself into trouble by his *aisiness*.

One of the dairymaids, whose name was Judith, was the beauty of the county. She had fine black hair, handsome features, and a clear skin; but besides these personal attractions, she was a girl of some taste, and always kept herself as neat as a new pin. She was also intelligent and sprightly; her voice usually led the song in the cow-house and dairy, and much confidence was placed in her by her master and mistress.

At eighteen, Judith had many admirers, but only two aspired to her hand. It was generally believed that Judith had placed her affections on Garritt Byrne, and all other lovers had moved off in consequence, except one. This was an elderly man, not by any means good-looking, a little lame, and very rich. On account of his personal infirmity, he was called the *Lameter*—a term commonly applied in Ireland [as it is in Scotland] to a lame person. The Lameter, however, for all his limping gait, was a brisk, confident sort of man, not easily daunted; and although he was aware of Judith's preference, he still hung on perseveringly, trusting to some lucky turn in his favour.

Judith, it must be owned, acted rather coquetishly. She used to give the Lameter now and then a look of encouragement, which maintained his hopes; though the truth was, all her jiltish airs were employed in order to bring Garritt to a distinct arrangement as to the marriage. But Garritt, in his *aisy* way, looked on the encouragement of the Lameter as a piece of nonsense, and only laughed at the idea of Judith giving him up for such an insignificant rival. Garritt and Judith had been long attached to each other; explanations had been made; and for more than a year they had agreed on being married, as soon as each had gathered up what was thought sufficient.

This agreement was known in the house, and every article that was not required again, or had lost its fellow, was put by for Judith. Before the year was out, Garritt made known that he had accumulated the requisite sum; but he spoke not of the wedding, except as

still in prospect, and seemed as if he did not know his own mind. No woman likes to be trifled with in this kind of way. Judith's pride was concerned, and she resented the affront so far as to hint that she did not intend to wait on Garritt Byrne's pleasure much longer, not she. At last she said decidedly that Holy Eve should see her married. She was not afraid of finding a husband. Garritt laughed louder than ever at the idea of the Lameter.

Summer glided past, autumn came on, and Garritt was often away in the mountains for days at a time with his cattle. He seemed to pay little attention to Judith's coldness of manner; nor did he appear to remember her threat; yet every one else felt assured that she would put it in execution.

As Holy Eve drew nearer, there were evident preparations for a wedding. A white dress was bought and made up; no one, however, knew who was to be the happy man. The Lameter was not oftener at the house than usual in the evenings, but he appeared more elated than was his wont, and Judith appeared sadder and more anxious. Judith was promised a house near the Hall, and was to continue to be dairymaid; so that it made little difference to her master who her husband was to be.

The morning of Holy Eve came, and Garritt Byrne was in the mountains with the cattle, where he had been for several days previously, and there appeared no sign of his return, or preparation on his part for joining in the evening's ceremony and amusements.

A large barn was cleared out, and doors laid on the floors of the lower rooms for dancing on. A large room on the second storey, which was gained by narrow steep stairs, boarded at each side, was laid out with tea-tables, where the young ladies presided. The evening drew on; the bride was dressed in her white gown and a lace cap with white ribbons; the fiddlers arrived, the tea was ready, and the company come. No doubt now remained as to who was the happy man; for the Lameter arrived in full dress, with white waistcoat and cravat, and a new suit, and looked brisker than ever. He carried a jar of whisky and a glass, and regaled the dancers, who were setting to with might and main. Most of the female part of the company were taking tea up stairs with the bride; and the Lameter and the bride's brother accordingly came up to see that all was going on rightly. Judith was deadly pale, but showed no symptom of altering her determination. She received the bridegroom's awkward compliments with a smiling face as she handed him a cup of tea. A report having spread from below that the priest was coming, for a few moments she appeared stupified; then suddenly turning to the Lameter, she said aloud, 'Have you a ring?'

This was an awkward question. The Lameter stammered out, 'No; I never thought of getting one.'

'Because,' said Judith, with a toss of her head, 'I will never be married with a key, a straw ring, or the priest's watch-chain; I must have a real gold ring of my own.'

If the Lameter had had wings, he would have flown to gratify fair Judith's slightest wish; but as he had none, he hopped over to measure her finger, assuring her that he would buy her the handsomest ring in the town; and taking her brother along with him, he proceeded to the house of the only jeweller (otherwise watchmaker) to get one.

The priest's coming was a false alarm; for he was not thinking of stirring yet, and was sitting at a snug fire taking a tumbler of punch in his own house.

Judith became more composed; she had gained a delay, which might yet be lengthened, by her finding some fault with the ring when it came. But she appeared to fear the arrival of the priest, as she knew that she must then submit quietly to her own decree. But priest or bridegroom were not come yet, and no sound could be heard but of the music and dancing below stairs.

A quarter of an hour passed; Judith was anxiously

listening, when suddenly the large gate in the yard was opened with violence: in a minute after, heavy, quick steps were heard on the stairs, the door burst open, and there appeared Garritt Byrne in his long gray coat, covered with mud, and out of breath. His eyes were dazzled with the blaze of light; he passed his hand across them, and was soon beside Judith. He could not speak, but his arm was round her waist; a stride or two brought them to the door, and before the women recovered from their surprise, or could make any resistance, supposing them to have been willing, they were down the stairs. Garritt seized a dark cloak, which one of the dancers had hung at the door, and wrapping it round Judith, they hastily crossed the yard, passed through the gate, and took the road to the town. Not a word was spoke by either as they walked swiftly along. As they passed the jeweller's shop, Judith cast in a fearful glance, and saw her brother and late bridegroom still engaged choosing and bargaining for a ring. Judith breathed quicker, and drew closer to Garritt at the sickening sight. On they walked, until they gained the far end of the town, where the priest resided. Garritt stopped at his door, and gave one thundering knock. The priest's boy (a man of fifty), not very remarkable for brightness of intellect or sharpness of sight, opened the door, and welcomed the bride and bridegroom, as the former threw off the dark mantle on entering the priest's parlour, and displayed her white dress. His reverence was sitting at his warm fire, and was trying to prevail on himself to leave it, and make ready to attend the wedding at Squire Johnson's, and was now most happy to find that the young couple were so considerate as to come to him; and knowing that Judith was to be the bride, he did not suspect in the least that there had been a change of bridegrooms; and thought that all was right, although he might have noticed the soiled face and hands and dirty dress of Garritt. The money was paid, the boy and the cook were called in, and the ceremony was performed in a short time. Judith was not now so particular about a gold ring, when the priest took a small brass curtain ring from his pocket, and gave it to Garritt, with a knowing wink, to place on her finger. The priest gave them his blessing, and they were soon beyond pursuit, and safely housed in the mountains among Byrne's relatives, 'uncles and cousins by dozens' of the name—the whole affair reminding one of the story of the brave Lochinvar, and perhaps equally worthy of versification.

To account for Garritt's indifference, and his late, though sudden appearance, it must be told that he never believed that Judith really intended to put her threat into execution; and as he had no intention of hurrying the marriage, so he was contentedly attending to his master's cattle in the mountains, about five miles off. He had put them in their sheds, and foddered them for the night, and had just succeeded in lighting a good fire in his own hut, when his little brother disturbed his quiet by rushing in as the sun was setting, and with more energy than his brother Garritt ever possessed, he cried out, as he gasped for breath, 'Garritt, man, what are you about sitting there, when Judith's wedding is going on? The priest is bespoken; and unless you have some life in yer heels, the Lameter will have her before an hour!'

Garritt waited not to answer this astounding news; but he had life in his heels for once, for, like an arrow from a bow, away shot Garritt down one hill and up the next, and never halted until he arrived at the gate: a friend awaited him there, who told him that he was not too late; he scarcely drew breath until he secured Judith. It is impossible to describe the confusion which ensued after the disappearance of the two lovers; the younger females were not sorry that Garritt had taken the bride; but the uproar was great down stairs when the men heard of it; for the noise they were making prevented them from hearing Garritt, and no one had seen him passing up or down the stairs. They first called for the Lameter, and next for Judith's brother,

but both were absent. The whole party were ready for pursuit, but they had no leader, and did not know what way to take; and none of them agreed on what to do; but they all allowed that it would look very foolish to the country to have let the bride be taken off from among them. Some said they could not be blamed, when the bridegroom and the bride's brother were away, and had left her in women's care. The Lameter and his intended brother-in-law returned in the midst of confusion, and asked why the music had ceased and the dancers left off. It was some time before one of the party told what had happened; the Lameter looked confounded at first, but soon rallied, and pretended to take the matter coolly. The brother was enraged, and took several young men with him to look for Judith; but, fortunately, they did not think of going to the priest's house, until it was too late to find her there. The Lameter made a speech, in which he said that although the bride was gone, yet whisky and the fiddlers remained, and he begged of all the company to make merry. They thought that they could not do better, and the music and dancing commenced again: the Lameter gave them plenty of whisky, and they were as noisy and merry as before.

It was reported that the Lameter asked several of the handsomest young girls present that night to accept of his hand and fortune; but they all told him that they would do no such thing as to take Judith's leaveings. So they all refused the honour then; but it is certain that he got a wife long before the next Holy Eve, and that she was present on that night, and the prettiest girl there when Judith disappeared.

Before many days were over, Judith was attending the dairy, and Garritt the cows, just as if nothing had happened them; and Garritt proved a very quiet, kind husband, and Judith a tidy, smart little wife.

Now for my moral—said the lady in conclusion—and it is this: I would have all young men learn not to put off their weddings too long after they have wooed and won, and have sufficient means to marry, the damsel of their choice. And I would warn all young women to beware of making rash resolutions, the keeping of which might destroy their happiness for ever.

ANGLO-INDIAN LADIES.

In a recent number* we gave a general picture of the English in India, and we are now tempted by an article in the 'Calcutta Review' to descend to particulars. The article is called 'French Pictures of the English in India;' and we select it for notice, because we cannot help being tickled with the idea of an Englishman, broiling in an almost intertropical climate, sitting down to defend himself and his womankind from the strictures of a Frenchman. Between the two, one would think the truth must out; and more especially since the Count de Warren, being an officer in the Company's army, enjoyed every opportunity of observing the society it is his object to criticise. If the fact were otherwise—if the count were a mere bookmaker, who described at second-hand, the contest would have little interest for the spectator; but as it is, there is a certain equality in the literary warfare, which satisfies our notions of fair play; and as we watch the parties, we feel as if we were umpire in the contest.

The career of a young English woman in India, Count de Warren tells us, is 'a tragi-comic sort of history;' and, to prove the assertion, he traces her fortunes from the time she leaves England, where, it seems, she has grown up 'without portion, without connexions, without beauty, and consequently without even the hope of an establishment.' These are grave charges at the outset. She is poor, plain, ungenteel—in short, an adven-

* Journal, No 164.

turess; and in this desperate plight, all on a sudden there turns out to be somebody or other at Calcutta or Madras who will take charge of the consignment if she is sent out to them. The girl is of course in the seventh heaven; she has nothing to leave at home, and everything to look for abroad; and she sets sail, therefore, for the asylum that is offered her, 'full of health, of hope, and of gaiety, on a voyage of discovery in search of a husband.'

All this is denied by the reviewer. The age of damsel-errantry, he says, is past. 'The greater number of young ladies who embark for India on board our splendid passenger ships, turn their faces towards the East, because their home is there. Their legitimate protectors reside in India, and they are but returning to the parental roof, from which the circumstances of their position have temporarily banished them. They do not often arrive in the country with very extravagant notions of the splendid establishments in store for them—or indeed with any very absorbing thoughts of the great matter of matrimony at all.' The 'circumstances of their position' will be a mystery to some of our readers, and we must therefore explain, that children of European parents do not thrive—indeed rarely live—in India after a certain age. It is necessary to send them home, to have their constitution strengthened, or formed, by their ancestral climate; and they are seldom recalled till they have grown up into young lads or young women. But what strikes us as a terrible omission on the part of the reviewer, is his passing over, without remark, the charge of *plainness*. No; we will not think this an omission. It is contemptuous silence. It is a disdainful reply to an imputation too obviously and extravagantly false for serious refutation. As for his gratuitous remark upon the slight hold which the subject of matrimony takes upon a young girl's imagination, we confess we have some doubts; but the truth is, neither he nor any other individual of our sex has the least right to venture even upon a surmise about the matter.

The adventuress, however, has arrived in Calcutta, and looks around her for what, according to Count de Warren, she has come—a husband. 'Assuredly she will not have any difficulty in finding one; she will only be embarrassed by the number she may choose from—old and young, civil and military, patrician and plebeian; from the old general with his periodical bilious attacks and his parchment visage, which has not perished for the last ten years, for the sun has sucked out all the moisture, to the young red-and-white ensign, who makes eyes at them whilst he wipes off the large drops that roll down his forehead. She is scarcely landed, before, in the very first fortnight, she is overwhelmed with offers of marriage. The poor young creature is so stunned with the flatteries which buzz in her ears, that at length her poor little head, never one of the strongest, is completely turned. She begins to think that she really possesses all the perfections which are attributed to her; and she is told so often that she is an angel, that she knows not how to limit her pretensions in the great matter of the *établissement*. The aunt preaches to her, morning and night, against lowering herself by condescending to dance with any one under the rank of a first-class civilian, or an officer of high standing, in the enjoyment of a fat appointment, who can bestow on his bride thrice indispensable things, and which in India are considered necessary for the happiness of conjugal life; namely, a silver teapot, a palanquin with a set of bearers, for visits by day, and a buggy for the evening drive.'

Failing in all efforts to make a desirable match, we are told by the count that the lady 'all-forlorn' at length goes prettily for the sake of her health to a distant station, and there marries a poor subaltern. A marriage like this is of course unfortunate. The wife has no domestic habits, no knowledge of house-keeping; and instead of getting her husband's affairs into some sort of order, and introducing economy into his establishment, she compels him, either by her igno-

rance or her 'gentility,' to keep a *khanasamah*, or male housekeeper, who is the greatest thief in the world. 'No concession is made to circumstances or to places. Even when travelling, the ladies will not abate one ribbon from their toilet. Change of climate—change of fortune—nothing will induce an Englishman to descend from his first style of living. He will live as he has lived; and when he is ruined, he will run into debt rather than submit to be poor, and live like a poor man.' The reviewer admits that there is some truth in this charge of extravagance; but denies that even a ruined man necessarily finds his moneyless bride a burden. 'We could point,' says he, 'to numberless instances of regimental subalterns, who, having been involved before marriage, have, after a few years of wedded life, extricated themselves, by prudence and good management, from their incumbrances, and yet all the time kept up a much more respectable appearance than others who have been carelessly frittering away much larger sums.' He asserts that marriage is by no means the business of young ladies; that they are in no hurry whatever; that they spend a reasonable time under their guardians' roofs; and that 'young gentlemen do not think any worse of them for having learned one class of domestic duties before they address themselves to the study of another.' He admits, however, that 'India does not improve their aspect' (the count's charge is, that it makes them yellow), but hints that the men do not look upon beauty as consisting in rosy cheeks or plump proportions: 'or if they do,' adds he philosophically, 'why, it is assuredly much better, as the roses must fade and the plumpness dwindle, that this distressing change should take place before, and not after, marriage.'

Count de Warren's opinion of the manners of his adventuresses is not very favourable:—'As for the women with whom one has to dine and to talk, nothing can be more silly or more scandalous than the conversation to which one is condemned. It is not that they want mind or capacity—they are generally better educated than our own women—but it is that detestable fashion, which compels you always to view them through an odious medium. An English lady, showing her ability to converse on serious subjects with a man of merit, incurs the risk of being taunted as a *savante*—a blue-stocking; the greatest injury that can be inflicted upon her. It is becoming in her to appear offended if you talk rather seriously about politics or literature; but she will call forth all her eloquence, and never halt, whilst she favours you with all the details of the nursing, the weaning, and the physicking of her children; or, better still, pulls to pieces the reputations of her neighbours. The position of the young married women is still more deplorable. They have to choose between two evils—an affectation of ignorance on the one side, impossible after all they have read, from their very infancy, in un mutilated (*non châtiées*) editions of the Bible, or an abandonment of the most enticing, the most "romping" description. The one class appear to be astonished at everything, ever returning for answer the everlasting words, "oh dear me!" the other throwing themselves at the heads of all the men, with a prodigal display of loud talking and loud laughing in the worst possible taste.' On this subject the reviewer remarks, that young ladies from England pretty nearly resemble young ladies in England; that there is more domesticity in Indian life than formerly; that ladies are, for the most part, to be seen at home happy, contented, amiable; and that they are very skilful in adapting their conversation to the supposed calibre of their hearers—a circumstance which may account, he hints, for the views adopted by the count.

But now we have the ladies at dinner. 'If you are a Frenchman, you will be thunderstruck at the enormous quantity of beer and wine absorbed by these young English ladies, in appearance so pale and delicate. I could scarcely recover from my astonishment at seeing my fair neighbour quietly dispose of a bottle and a half

of very strong beer, eked out with a fair allowance of claret, and wind up with five or six glasses of light but spirited champagne, taken with her dessert. The only effect it seemed to produce upon her was visible in the diminished languor of her manner, and the increased brilliancy of her eyes. I hoped at first that she was an exception; but I was very soon convinced that she but exemplified the general rule. It is in this manner that the majority of English ladies combat the lassitude of mind and body induced by the climate; but the time soon comes when such a regimen as this destroys their health. They are then compelled to leave their husbands, and return with their children to Europe. But the fatal habit is contracted; the voyage home only tends to strengthen it. As time advances, it becomes more deeply rooted; and too often the brandy bottle is the miserable finale of the sweet creatures, who left their mother's arms and their father's roof all bright in purity and beauty. This picture is of course represented as ludicrously absurd. The count's mistake, we are told, arises from the custom, still extant in India, of asking people to take wine. The glass of the lady of the house may thus be in part replenished a dozen times, but it would be monstrous to assert that she drinks a dozen glasses of wine. He might have added, that returned Indian ladies are not more famous for brandy-drinking than other ladies in England. Let us note also, that, for the sake of the climax, the poor, plain, and ungenteel adventuress is now supposed to have been the pure and beautiful darling of a tender home.

We have now done with Count de Warren, and shall give the reviewer's opinion of married life in India:—'We do not hesitate to express an opinion to the effect, that in no community with whose social characteristics we are acquainted, is there more married happiness than among the English in the East. . . . There are many circumstances peculiar to India favourable to the development of married happiness; none which are unfavourable to it, in the aspects represented by our author. Husbands and wives are more dependent on each other in this country than at home. Necessitated during the greater part of the day to remain within doors, the married officer seldom fails to derive comfort and consolation from the companionship of his wife; he has a better-ordered house, a better-regulated establishment; and what a difference when sickness is there! There is no place in the world where a man stands more in need of such companionship; and if imprudent marriages are sometimes perpetrated, there is everything to excuse them. In a worldly sense, doubtless poverty is a great evil; domestic privations, whether in one hemisphere or another, are not very pleasant to bear; but in India, poverty has rarely that very humiliating aspect which it so frequently wears at home. Poverty, we repeat, does not *rub* against us so painfully as it does in England; it is not so palpable—its evils are not so omnipresent. Neither the physical nor the moral evils are so keenly felt, for there is no want; and where debt has not come to humble us, there is no degradation. Look at the struggles of poor people in England! We do not speak of poor people, but of poor rich people. How painful their efforts to appear respectable—to conceal the deprivations which they endure! Poverty in this country is not an unforgivable offence. Here a man may have a very small income, and a very large circle of friends. At home, this phenomenon may sometimes be seen in the person of a clever and agreeable bachelor. But let him marry, and the scene is changed. Here poor married people are not, as such, cut off from society; they are not regarded as people to be avoided; they are not taught by their richer neighbours to feel what it is to be poor. Neither is the name of poverty inseparably associated with ideas of maids-of-all-work, washed mutton, soap-suds, and tallow-candle-ends.'

Being able to sift the evidence on both sides, with the assistance of more than one score of conflicting witnesses, we are of opinion that Count de Warren's pictures are grossly and ridiculously overcharged, and also that

the reviewer paints a little too much *en beau*. A mighty improvement has taken place of late years in Anglo-Indian society; but there still remains much to be done. Society in India is composed, almost exclusively, of reasonably well-educated people; and much more may justly be expected of them than if they were intermixed, as in this country, with the ignorant. But they have still a great deal of trash and frippery to get rid of. The enervating influence of the climate can be no excuse for these in social life, for, as regards serious duties, no country under heaven produces more brilliant examples both of physical and intellectual energy. Nay, even the Calcutta belle, who passes a great part of the day 'annihilated' by the heat, rushes into the dance in the evening with an enthusiasm and perseverance unequalled at Almacks. The import trade in books, however, languishes. We believe we are correct in stating that, notwithstanding the movement in the population, not the slightest improvement has taken place for many years; whereas the import trade in *millinery* continues to make a steady and triumphant progress! These are awkward signs of the times—and we venture to suggest that they would afford a good subject for the earnest and able pen of the reviewer.

JAMES CROWTHER, THE NATURALIST.

It is somewhat remarkable that there has long been at Manchester a set of men in humble life who devote their leisure time chiefly to the study of natural history. The newspapers lately gave an account of a member of this corps, which has struck our minds not merely as a curious and interesting piece of biography, but as something singularly affecting. James Crowther, though known in the scientific world for his having discovered many British plants in situations where they were not previously suspected, was never in any superior position in life to that of a warehouse porter. He died in January of the present year, at the age of seventy-eight, in obscure and necessitous circumstances—even, we regret to think, under a certain degree of privation; that is to say, while not without the common necessities of life, he entirely wanted those comforts which his age and ailments demanded. Yet this seems to have been rather owing to his own modesty, in not making his wants known, than to any indifference on the part of his neighbours, and those who knew his acquirements as a naturalist. Still, it is sad to think that this worthy old man had only a pension of three shillings a-week to depend upon—the bounty of a Society for the Relief and Encouragement of Scientific Men in Humble Life—and that one of the seven sovereigns which were subscribed for his funeral and the erection of a little stone over his grave, would have been felt by him as a blessing at any time during the few weeks preceding his decease.

Crowther was a native of Manchester, and from nine years of age, when he became a draw-boy, he formed a unit among the toiling thousands of that seat of industry. He had previously attended various schools, and thus entered life as a man not wholly illiterate. From his earliest years, he delighted to examine every natural object which came in his way, and plants, above all things, attracted him. He soon came into connexion with the group of working-men who then associated in Manchester for the cultivation of botany. It was not uncommon for forty such persons to meet together weekly in the spring and summer seasons, in order to show to each other the rare plants they had collected, and discuss their characters. To pursue the account of Crowther, read some years ago before the society which latterly contributed to his support—'Often after he had finished his day's work, he would set off and walk fifteen or twenty miles out of town, to collect a plant he had been informed of. He generally managed to reach the place of his destination at dawn of day, before any of the people were stirring, and thus escaped being taken up as a thief or a poacher, and was able to return to

Manchester in time for his work. Notwithstanding all his precautions, however, he was often pursued, and had many narrow escapes from being captured. He often contrived to elude his pursuers by his extraordinary swiftness in running. Many were the hot chases he had had; but the most severe run was with Mr Hopwood's keepers, in Hopwood Park. They once pursued him three or four miles straight across the country without stopping, and he considered it nearly a miracle that he escaped them. John Dewhurst and Edward Hobson were his chief companions in these excursions, and amusing are the anecdotes he relates of their botanical rambles in Cotterill, Marple, Ashworth, and Birtle Cloughs, and in the neighbourhood of Greenfield, in Saddleworth—all famous localities for lichens and mosses. Crowther has discovered many plants and insects new to this neighbourhood. In company with John Dewhurst, he first found the *Limosella aquatica* at Mere, in Cheshire. When he saw it, he threw up his hat for joy; and on Dewhurst turning round to see what was the matter, Crowther cried out that he had found a new plant—a perfect gem. On their return home, they informed Hobson of the circumstance; but he would not believe them, he said, unless he saw with his own eyes the plant growing. The journey of Crowther and Hobson to see this plant is very pleasantly described by Mr Moore, F.L.S. in his memoir of the late Edward Hobson, in the following words:—"An amusing instance of Hobson's perseverance in procuring scarce specimens is related in connexion with his old companion Crowther. The latter having declared that he had seen an aquatic plant, which Hobson much wanted, growing in a mere near Knutsford, it was agreed that they should go there and procure it. Hobson had great doubts as to their meeting with it; and when they came in sight of the lake, poor Crowther, whose accuracy was in question, had the mortification to find it so swollen with recent rains, that the plant was at least three feet under water. Hobson felt for Crowther's disappointment, and set about botanising in the adjoining fields, rather than complain of a fruitless journey. Whilst so engaged, he heard a plunge in the water, and looking round, Crowther had disappeared. In the greatest alarm, Hobson rushed back, and had the satisfaction to see the old man just emerging from the water, with the precious specimen in his grasp."

During manhood, and till age incapacitated him for work, Crowther was a warehouse porter. He married, and had several children, all of whom are still in humble life. His wages—at first sixteen shillings, afterwards a pound, a-week—were always rendered by him in full into his wife's guidance. To obtain a little more money for the gratification of his peculiar tastes, this honest fellow would go after six at night to wait the arrival of the Duke of Bridgewater's packet by the canal, that he might have a chance of getting a gentleman's luggage to carry. 'Being a favourite with the captains of the packets, who respected him, he was generally employed if a passenger required a porter. When the late Sir James E. Smith was engaged on one of his botanical works, he was spending a few days with his friend, the late Mr Roscoe, at Liverpool. Happening to mention to his host that he was delayed with his book from want of information relative to certain mosses and lichens, the former suggested that he should make inquiries of the weavers of Manchester, some of whom were good botanists. Sir J. E. Smith at first ridiculed the idea; but on being assured by his friend that he was likely to obtain the information he required, he proceeded to Manchester by the Duke of Bridgewater's packet. On arriving at Knott Mill, he inquired for a porter to carry his carpet-bag up to the inn, and old Crowther was engaged. After proceeding a short distance, he asked if Crowther knew some person who lived at Hullard Hall? "Oh yes, sir, I do, very well; he is a bit in my way." "Why, what way is that?" asked Sir J. E. Smith. "He is fond of collecting mosses and lichens," was the reply. A conversation ensued,

and Crowther went up to the Star Inn, and, as Sir J. E. Smith declares, furnished him with all the information he was in search of.' Crowther, in like manner, assisted Dr Hull in his work on 'British Botany.' A gentleman named Carmeletti had in a similar way been obliged to him. Crowther always spoke of the last-mentioned person with peculiar pleasure, for he had given the poor porter four shillings and a pair of new shoes for bringing him one rare plant which he found growing near Middlewich. Crowther was also fond of entomology, and had collected many insects as well as plants, all of which were sold from time to time when old age and poverty fell upon him.

When Crowther was a young man, there was a college in Manchester, which was afterwards removed to York. One of the Roscoes of Liverpool, studying at this seminary, was an ardent botanist, and frequently employed Crowther to collect specimens for him. Sometimes they took botanical excursions together. To follow the obituary memoir of our hero in the *Manchester Guardian*—"He was in his youth fond of a practical joke. On one excursion, noticing that Mr Roscoe was genteelly attired in the costume of that day—in shorts and white silk stockings—Crowther made his way into a soft, boggy, dirty place, somewhere in Crumpsall, the character of which was somewhat disguised by a green covering of grass and herbage; and when in the midst of this, he called eagerly to Mr Roscoe, as if he had found some rare plant. Mr Roscoe hastened towards him, and soon plunged up to his knees, his white silk stockings receiving a complete coating or varnish of boggy mud. Mr Roscoe bore his ludicrous mishap with great good-humour; and after getting cleansed, and a little refreshment at a house not far off, they returned home. Shortly afterwards, Crowther, visiting Mr Roscoe at his lodgings, was induced to take hold of the chain of an electrical machine (and these machines were then not so well known as at present), when Mr Roscoe gave him as severe a shock as he dared; and Crowther said he was quite stunned by it, and did not feel right again for some time afterwards. "There," said Roscoe, "you bogged me; now I've electrified you; and we are all straight again."

The writer in the 'Guardian' adds a few anecdotes of the perils which then beset such poor votaries of science in their ramblings after plants. 'On one occasion Crowther and Richard Buxton went out together to Staly Moor, and to a valley called Staly Brushes, in search of a particular plant, taking with them as a guide a person who lived at Ashton. By him they were led rather higher up the hill-side of the moor than they ought to have gone, and consequently they got amongst the grouse. They had not been there long hunting, not the grouse, but their own botanical game, when a gamekeeper came up, told them they were trespassing, and accused them of poaching. They for some time could not satisfy him that they were only botanists, that they were in search of a particularly rare plant, the "cloudberry"—so called from its growing on high hills, which are often cloud-capped—(the *Rubus chamaemorus*). The gamekeeper for some time would not believe them, and was very abusive, saying he knew they were after game. They showed him their plant-boxes; but he said these were shuffling excuses, and he threatened to take them before the magistrates for poaching. At last, however, finding they had no guns, or snares, and by degrees becoming satisfied of their having no hostile views on the grouse, he permitted them to go, and directed them the way to the bottom of the valley, which they took with great alacrity, and with no small thankfulness at their escape from so awkward a predicament.

'Upon another occasion, Crowther was actually brought before a magistrate on suspicion of poaching. He was botanising on the estate of Mr Egerton of Tatton, and when in search of aquatic plants, he frequently carried a rod, not unlike a fishing-rod in general appearance, having joints, with brass ferrules; but

at the end of this long rod were two hooks, one sharpened at the inner edge, in the form of a sickle, with which he cut off plants growing far in the water, and with the other hook, which was not sharpened, he angled the plants to the bank. Once while thus engaged in a mere, or piece of water, on the estate of Mr Egerton, two gamekeepers came up and seized him; and notwithstanding all his protestations to the contrary, and his assurances that he was not fishing for fish, but for plants, took him before Mr Egerton on a charge of poaching. Mr Egerton interrogated him, and Crowther told him what his pursuit really was, and exhibited his tackle and hooks, which it was at once seen were not very well adapted for angling for carp, perch, or trout; and the result was, that Mr Egerton directed that he should be immediately liberated, saying to the keepers, "Let him go wherever he has a mind in future, and do not molest him any more."

'Another of Crowther's perils was from a savage bull. It was his habit, in the Whitesuntide week, when the annual races gave a general holiday to the work-people of the town and neighbourhood, to make a pedestrian botanical excursion to Craven, Yorkshire; and he visited that neighbourhood several years at that period. On one occasion, while botanising there, he found a bull coming directly towards him, with most unequivocal symptoms of intending mischief. The hilly fields in that neighbourhood are all divided by stone fences, some of these being walls of considerable height. He succeeded in reaching and climbing one of these high walls before the bull reached the spot. There stood the savage animal just below him, bellowing, lashing his tail, and exhibiting every mark of fury. Crowther, as he sat on the coping of the wall, just out of reach of the bull, thought, if he could detach a large stone from it, he might give the animal a temporary quietus. He succeeded in loosening a large and heavy stone, and poising it with both hands, he launched it with all his force at the bull's head, and with such effect, that the animal dropped on the ground as if killed. Crowther stayed not to see the issue of his adventure, but ran off on the other side of the wall. When telling this adventure, he invariably expressed his belief that he had really killed the bull.'

Our humble botanist seems to have been at all times a sober and well-behaved man. In the various notices respecting him, we hear of no blame whatever attending his modest but persevering love of natural history. He seems to have borne the penury of his latter years with the most perfect resignation, as befitted the pure and unsophisticated lover of nature. His last wish was, that he might be laid in St George's burial-ground at Hulme, next the remains of his old friend Hobson, with whom, when alive, he had passed his happiest hours. It was a 'last wish' worthy of the simple and amiable character of the man, and of course it was fulfilled.

Amongst the various means of superseding mean with worthy and innocent indulgences, we are surprised that natural history has met with so little attention. As a source of gratification and amusement, taking it in its lowest aspect, we know nothing so exempt from all corrupting tendency. It seems to have the irresistible effect of abstracting the mind from all that is gross and sordid. The first simplicity is sustained by nothing so well as by natural history. Perhaps we should not be saying too much if we said that the elements of a beautiful religion lay in this study, when its study is set about in a right manner. Why, then, are not our youth more generally initiated in natural history as a branch of education? In no rank would it fail to work to good ends. The poorest class of workmen would possess 'riches countless,' in a taste like that of Crowther and Hobson. The common soldier, if acquainted in even a small measure with botany or entomology, would have at command a means of enjoyment which would make the dreariest of home or foreign stations to him a paradise. And the researches of such persons, both at home and abroad, would, we cannot doubt, help much

to advance science itself. Nor should we overlook the important effects of such studies in bringing men of different classes together on a footing of equality, which must tend to make the social machine the firmer in its joinings. On the other hand, what a redemption is furnished by natural history for the young man of fortune! Those energies, those precious possessions, which are too often squandered on the turf, or dissipated in tiresome idleness, how might they be converted to noble uses, if our youth of the higher classes were inspired with a love of natural history! On this subject we shall relate an illustrative anecdote, which may form an appropriate conclusion to the present paper. An ingenious naturalist was lecturing a few years ago at a watering-place on certain curious preparations of the lower marine animals, which he had spent years in elaborating. Amongst the audience was a peer, who had spent a brilliant fortune in the follies which beset his class, and was now in much reduced circumstances, but who had naturally some good dispositions. This gentleman listened to the lecture with the keenest interest, and after its conclusion, lingered behind to examine the specimens, and converse with the lecturer. 'Oh God!' he at last exclaimed, 'had I but been taught a little of this science in my early days, from what it might have saved me!'

SOCIAL MEETINGS.

IN all ages of the world, and almost everywhere in the world, there have been social meetings for the purpose of eating and drinking. These are the grand staples of mutual entertainment, pitched upon by the general instinct of mankind, and the exceptions are so few, as to prove the rule. We live, however, in an age that has very little respect for customs, merely because they are old; and perhaps the fulness of time has come when it will not be thought downright impiety to inquire whether there is any extraordinary merit in a social dinner? Eating and drinking are mere animal necessities, which can hardly be supposed to require encouragement; and if it is not for the purpose of encouragement, surely it is a little absurd to invest them with so much state and dignity. Why choose this instinct for patronage in preference to any of the rest? Why elevate hunger into a virtue? We really cannot tell. All we know is, that mankind in all ages have had a pleasure in eating and drinking together. The practice infers hospitable and social feelings: there is friendship, it is said, even in the interchange of a pinch of snuff!

Social meetings being universally acknowledged to be one of the good old ways of securing a little happiness, it strikes us that it is of importance to do the thing well. Some people perhaps imagine that money is the great moving power in social intercourse. Nobody of course can eat and drink without having a purse of some kind to draw on; but money, after all, is only a subordinate in the affair—there must be something else; and it is for want of consideration on this point that social dinners, so called, are often so terribly dull. What, too often, is a modern dinner? Some dozen or so of ladies and gentlemen meet in a drawing-room, all nicely dressed, all desperately dull, few perhaps acquainted with each other, none knowing exactly what to say, or caring to say it if he did, and everybody wondering when that horrible quarter of an hour is to end. At length the welcome announcement is heard. The party move off in pairs, and down stairs they trip, with the decorum of the company entering the ark, 'each male and female after its kind.'

'Is this a dinner? this a genial room?

No: 'tis a temple and a hecatomb!'

The more quiet people have dined hours ago, for it is now far on in the evening; but they look at their neighbours satisfying their hunger, and amuse themselves with the brilliance of the equipage and the flavour of the wines. As for the conversation, there is no such thing—and there can be none. The host has pro-

vided food and drink in every imaginable variety—porcelain, crystal, silver, till the eyes ache with splendour; but as for conversation—as for the means of passing the time otherwise than in the exercise of the animal instincts—it has not entered his thoughts. The very highest point to which his intelligence has soared in the selection of the company, is with reference to the balance of the sexes. Beyond this, he cares nothing about the matter. His dinner, according to rule made and provided, is to be a mere feast of the senses, intended for the gratification of the lower instincts of his guests. There, then, lies the error. A dinner, to be worth anything, must not only be a good dinner in the usual sense of the word—it must be enjoyed by a properly-assorted company; a happy party, each contributing his share of conversation and pleasantry to the feast. As all this seems unrealisable, we very nearly bring ourselves to the fancy that dinners will not long be able to keep their ground. If not revolutionised, the system must inevitably disappear.

So also must there be a power of amusing to some distinct purpose in all other kinds of social meetings. In private evening entertainments, the French have always beat the English. What interesting accounts could be given of the literary soirées of the seventeenth century in Paris! Among other places attractive for their intellectual brilliancy, was the residence of the beautiful and eccentric Marchioness Rombouillet. The interior of her hotel was of her own design; and with the fearlessness of genius, she even painted the walls of another colour than the red and tawny to which Paris was before restricted, calling one of her rooms the Blue Chamber. It was in this room, which was furnished in blue velvet, embroidered with gold and silver, that she received her visitors; and it set the example of a light and elegant fashion, which subsequently became popular both in France and England—its windows sweeping down without interruption from the ceiling to the floor, and thus affording free entrance to the air, and a complete view of the garden without. Hither crowded, for nearly half a century, the most distinguished authors of the day, and here they were met, on common ground, by the aristocracy of rank. Admission to this enchanted circle fixed a man's position in society.

The reunions at the house of Paul Scarron, the buffoon writer—deformed, gouty, and poor—comprised most of the first wits, male and female, of the time. There Lafontaine recited his fables, Motta told his stories, and Ninon sang her songs. And so on with many other evening meetings, to which the charms of literature lent their attractions. In the present day, though under a different style of manners, the evening parties in the French capital are conducted on a principle of rational intercourse, without either the formalities or the expense which oppress London entertainments. What we would wish to see is a little more intellectuality in our reunions; a little more ease, love, and kindness, would likewise be an improvement. The following seems to be a pretty common receipt for making up evening parties:—

Take a certain number of ladies, and scatter them about one end of the room on chairs, two or three feet apart, each lady overflowing her chair with her ample drapery. Send in among them a forlorn-hope of white cravats, the main body of which remains at the other end of the room. Let a buzz of conversation arise from committees of rarely more than two, and never more than three in number; while many of the guests—perhaps the majority—show their talent for silence by holding their tongues. Set a young lady down to the piano, and there let her murder an Italian song, while she might have imparted some pleasure by giving a native melody. Let the servants glide through the assembly from time to time with coffee, and after the *ennui* has become insupportable, let everybody go away. Sometimes literary people, or those who affect to be such, form an element in these meetings; but somehow, even with their aid, the affair is triste. Men of

any note do not like to be invited on the principle of being shown off, and therefore, possibly, they revenge themselves by being nobody.

Perhaps the best London parties of late years were those of Dr Kitchener, where there was not only excellent company, but excellent amusement. Usually, first-rate vocalists were frequently present; there was always the telescope in the observatory, and sometimes the moon out of doors to be looked at; and at the end there was a repast, curious from its gastronomical treasures. But the doctor himself was the great curiosity of the evening—the spectacle, as it were, on which the attention of the company was fixed—a marvel to his guests in astronomy, gastronomy, phisic, music, and optics. One grand regulation of these parties was, that no one was allowed to stay beyond a certain hour—eleven o'clock.

We remember some parties at John Martin's the painter, which were tolerably pleasant, apparently because they were small, and almost all the company well acquainted with each other. But when our host accidentally picked up a superb Venus at an old-furniture shop, and placed her behind a curtain in one of the rooms, it is surprising what a fillip this gave to the enjoyment of the evening. It was an object for *all* the company to look at and think of; it was an object of social attraction, which directed the current of conversation; and it set afloat more poetical ideas, and elicited more striking criticisms in art, than we had ever met with before at an evening party, or ever met with again.

From these illustrations, it may be observed that givers of parties should aim at something more than the mere trifling away of time, or the overpowering of the senses with splendour. We confess the difficulty of the subject, the more especially as all are not favourably situated for following out enlarged notions of social intercourse. Fashion, that terrible bugbear, must also be overcome. We are not without the impression that, if evening parties were well organised, they would go far towards putting down dinners, which, with all that can be said for them, are a sort of *social absurdity*—an excrescence clinging to the civilisation of the age. And in putting down dinners, they would add to the general amount of sociality. Dinners, as usually conducted, are not only strictly unsocial themselves, but the cause of unsociableness in other things. In spite of their rich meats and luscious wines, they give a dry and hard tone to society. The display, which is their being, extends throughout all the relations of life. If dinners were at an end—if we broke ourselves of the habit of looking to them as the grand resource, we should by and by get the length even of visiting, in a friendly way, at each others' houses, like fellow-denizens of the earth, brethren and sisters of humanity, without an invitation at all!

AN ADVENTURE IN HUNGARY.

FROM THE GERMAN.

On the third day after his departure from Vienna, a horse-dealer alighted at an inn situated at the entrance of a little town, which, to all appearance, was respectable and quiet. He recommended his horse to the care of the landlord, dried his clothes at the fire, and as soon as supper was ready, sat down to table with the host and his family, who appeared to be decent people.

During supper, the traveller was asked where he came from, and on his answering from Vienna, they were all anxious to hear some news of the capital. The horse-dealer told them all he knew. The landlord then asked him what business had taken him to Vienna, to which the latter replied that he had been there to sell some of the very finest horses that had ever appeared in the market there. At these words the landlord looked very significantly at a young man who sat opposite to him, and who appeared to be his son. His expressive glance did not escape the observation of the traveller, who, however, took no notice of it; yet he very soon after-

wards had cause to regret his want of caution. Being in want of repose, he begged the landlord, as soon as the supper was finished, to show him to his room. The landlord took a lamp, and conducted the traveller across a yard into a detached building, which contained two tolerably neat rooms. A bed was prepared at the farther end of the second.

As soon as the landlord had retired, the traveller undressed himself, unbuckled a money-belt containing a considerable sum in gold, and took out his pocket-book, which was full of Austrian bank-notes. Having convinced himself that his money was right, he placed both under his pillow, extinguished the light, and soon fell asleep, thanking God and all the saints for the success of his journey. He had slept about an hour or two, when he was suddenly awaked by the opening of the window, and immediately felt the night air blow in upon him.

Startled at this unforeseen circumstance, the traveller raised himself up in bed, and perceived the head and shoulders of a man who was struggling to get into the room; at the same time he heard the voices of several persons, who were standing under the window. A dreadful terror seized our traveller, who gave himself up for lost; and scarcely knowing what he did, crept under the bed as quickly as possible. A moment afterwards, a man sprang heavily into the room, and staggered up to the bed, supporting himself against the wall. Confounded as the horse-dealer was, he nevertheless perceived that the intruder was inebriated: this circumstance, however, gave him little hope, for he had probably got intoxicated in order to summon up courage for the contemplated crime; besides this, the traveller had heard the voices of persons outside, so that the murderer, in case of resistance, could count upon the assistance of his comrades. But how great was his astonishment when he saw the unknown person throw his coat upon the floor, and stretch himself upon the bed which he had just quitted! A few moments afterwards, he heard the intruder snore, and his terror began gradually to give way to reflection, although the whole affair was quite incomprehensible to him. He was just preparing to quit his hiding-place, in order to awake the inmates of the house, and ask for another bed in place of that from which he had been so unceremoniously expelled, when a new incident occurred.

He heard the outer door carefully opened, and on listening, the sound of cautious footsteps reached his ear. In a few minutes the door of his room opened, and two figures, those of the landlord and his son, stood on the threshold. 'Keep the lamp back,' muttered the father in a suppressed voice. 'What have we to fear?' said the young man; 'we are two against one: besides, he has only a small knife with him, and is sleeping soundly: hear how he snores.' 'Do what I tell you,' said the father angrily: 'do you wish to awake him? would you have his cries alarm the whole neighbourhood?' The horse-dealer was horrified with the spectacle. He remained motionless under the bed, scarcely daring to breathe. The son shut the door after him, and the two wretches approached the bed on tiptoe. An instant afterwards the bed was shook by a convulsive motion, and a stifled cry of pain confirmed the foreboding that the unhappy man in the bed had had his throat cut. After a short pause of awful silence, the landlord said, 'It is over now: look for the money.' 'I have found it under the pillow,' said the son; 'it is in a leathern belt and a pocket-book.' The murderers disappeared. Everything being now quiet, the traveller crept from under the bed, jumped out of the window, and hastened to the adjoining town to inform the authorities of what had happened.

The mayor immediately assembled the military, and in less than three-quarters of an hour the inn was surrounded by soldiers who had been summoned to arrest the murderers. The whole house seemed buried in profound silence, but on approaching the stables they heard a noise. The door was immediately broken in,

and the landlord and his son were seen busily digging a pit. As soon as the murderers saw the horse-dealer, they uttered a cry of horror, covered their faces with their hands, and fell to the ground. This was neither from repentance nor the fear of punishment, but they thought they saw before them the ghost of the murdered man, notwithstanding they heard him speak. There was some trouble in convincing them to the contrary. They were then bound, and led into the outhouse where the horrible deed had been committed, anxious to see how the enigma would be solved. The prisoners appeared tolerably collected, or at least calm and sullen; but when, on entering the room, they perceived the body which lay on the bed, the son fell senseless to the earth, and the father threw himself upon it with loud lamentations, clasped the bloody corpse, and exclaimed despairingly, 'My son! oh my son! I, thy father, am thy murderer!'

The murdered man was, in fact, the youngest son of the host. Drunkenness was the only fault this young man had; and this night, instead of being, as his father and brother supposed, in his bed, he had gone out secretly, and been carousing with some of his companions at the alehouse. Soon becoming sufficiently inebriated, and fearing his father's anger if he appeared before him in that state, he intended to pass the night in the detached outhouse, as he had often done before. His companions had accompanied him thither, and helped him to climb up to the window. The rest requires no further explanation. Nor do we need to add that the murderers expiated their crime with their life; and that the horse-dealer, although saved, and again in possession of his plundered property, still shudders at the recollection of that dreadful night.

PERPETUAL LAMPS.

THE incidental mention of these lamps, in an article which appeared in No. 143 of the current series, has induced us to take up the subject with an endeavour to set at rest the doubts, and if possible to clear up the obscurities, which still overshadow it. The paper mentioned in the article referred to was read at the York meeting of the Archaeological Institute by Mr Way; and thus, for at least the hundredth time, the question has been revived, discussed, and relinquished as an insoluble mystery after all. At the spoliation of the monasteries in York, says Camden, a vault attached to a little chapel was broken into, and an ignited lamp, which must have been burning for ages, was discovered therein. A curious and most interesting communication by Mr Wetherall followed, containing a minute account of another sepulchral lamp discovered on the route from Granada to Cordova, in an ancient Roman sepulchre, which was also burning at the time of discovery, but was broken in pieces by the carelessness of the labourers. In both cases the flame was instantly extinguished. There have been many accounts of these everlasting lamps by the learned of almost every age. Two or three notices will here suffice.

Fifteen hundred years after her death, the tomb of Tullia, Cicero's daughter, was accidentally discovered, and opened; and it was found to be illuminated by one of these lamps, the light being extinguished instantly on the admission of fresh air. More marvellous is the relation about the lamp of Olybius:—A Paduan peasant, on digging into the earth, accidentally struck on an urn; this contained another urn, within which was a lamp still burning, between two other vessels, the one full of liquid gold, and the other of liquid silver! An inscription upon the urn informed him that the great alchemical secret was contained in these vessels. Pausanias relates that Callimachus constructed a golden lamp, which he placed in the temple of Minerva at Athens; and after some oil had been poured into it, it continued burning for a whole year. Then there is an account, implicitly received by Licetus (the author of a ponderous folio on the subject), that the tomb of

Pallas, the Virgilian hero, was discovered in the year A. D. 1041; the corpse unchanged by time, with that gaping wound in the heart so affectingly described by the poet; and in the sepulchre was found a lamp, which, however, could not be put out by any means whatsoever; thus differing from the generally received characteristic of the 'perpetual lamps.' Merlin the magician, among other wonderful things which he accomplished, appears to have succeeded in constructing one of these lights, if we are to take the author before-mentioned as a credible authority. But we need not enumerate examples.

If the different accounts are to be credited, the mystery is completely beyond solution. Let us enter more closely into the subject. Camden, with a customary caution, lays the responsibility of the tale he recounts on the shoulders of several 'credible persons,' who related it to him, and contents himself with quoting Lazius for the exposition of the perpetual flame secret. The account of the lamp of Olybius is an obvious impossibility, until at least the laws which affect combustion undergo a very material alteration. The other examples may be as summarily disposed of, with the exception of the most recent alleged discovery in Spain. It is, however, much to be regretted that no archaeologist was present at the time; that none but ignorant rustics, full, possibly, of superstitious terrors, beheld this famous lamp, or we might have had the question set at rest for ever. There are suspicious circumstances about the tales, as they have been handed down to us, to which we do well to give heed. It is most unfortunate, then, that the 'perpetual lamps' *always* go out as soon as they are discovered. One would think they might have the grace, at anyrate, to keep in, after enduring unaltered the lapse of ages, for a few days or weeks, and so give us moderns a chance of getting trustworthy testimony concerning them. But no! they are no sooner found, than they are found out; and this, to ordinary judgments, confers upon them at once a highly apocryphal character. The ingenious Bishop Wilkins explains this feature of the lamps, by presuming that the exposure to open air disturbed the balance between the flame and the fuel, and that, consequently, the flame shortly went out; but this is a lame and impotent conclusion. It may also be asked—allowing that the lamps were found really burning, and were blown out accidentally—How is it that they have never been relighted, and handed down, from age to age, visible witnesses to the truth of the statements? The question cannot be answered. There is, moreover, an air of romance about every account that exists, which considerably damages its credibility as a matter of fact. On the whole, it may be averred that the stories at present received about these lamps are of a very questionable nature. There are, however, other grounds for doubting, and of a more satisfactory description. In the 'Archæologia' of the Society of Antiquaries, will be found an account of the discovery of a Roman sepulchral lamp, in a 'barrow,' at Barblon in Essex. The tomb was opened by an archaeologist fortunately, and the lamp was discovered in one corner of it, with all the appearance of having been long extinguished. The lamp, with its contents, was sent to Mr Faraday, the eminent chemical philosopher. In it was contained a cake of a substance, dry, brittle, and earthy in appearance. The upper surface of it was black, the lower green, from its contact with the bronze of the lamp. This substance was altogether combustible, and consisted simply of a fatty fuel, much changed by time. In the beak of the lamp was found a wick, evidently consisting of a fibrous vegetable material, about an inch in diameter, and half-consumed. Near the lamp stood what has been believed to be a curule chair—indicative of the official authority, or of the noble rank, of the tomb-tenant. Here, now, were all the elements of a splendid fable, excepting the simple circumstance of the lamp being out, which, there is little doubt, would have been overleaped, had the discovery taken place at another epoch,

and by other means. We may go a step beyond, and ask—If the 'perpetual lamps' were known to the ancients, how was it that a noble Roman's shade was left to the poor consolation of a vegetable wick and most unperpetual tallow? The historians of these lamps are not content with the simple assertion of their being in combustion, but they insist upon the 'fact,' that they gave forth sufficient light thoroughly to illuminate the sepulchre. This is another ground of objection. It is well known that light, in ordinary circumstances, as in a lamp, is produced by the ignition of solid particles of matter; the light of a lamp is due to the ignition of the carbon of its fuel. In burning, then, a certain amount of solid matter is consumed every minute. Dr Ure calculates that a mould candle consumes rather more than a hundred grains of tallow per hour. If we allow, to make a rough estimate, sixty grains of solid carbon to such a light per hour, this would demand about seventy pounds of solid carbon for one year, or about three tons for a century, for the production of the *light* alone of such a flame. This is, however, only an approximative statement of the case, as we are still to account for that portion of the fuel which contributes to the non-luminous part of flame. Thus a whole tallow-chandler's warehouse, economised as you will, would only supply a mould candle with fuel for about a century; and it will be a novel discovery indeed to the antiquarian world, if such a receptacle be ever found in connexion with any ancient sepulchre. We have taken the fuel to be of the nature of fat or tallow, but it is evident the same line of argument applies itself to all other kinds, excepting always that liquid Lazian gold, which ignorant moderns know nothing about. There is a further difficulty, which, even if an eternal supply of fuel were granted, would render the constant flame an impossibility; that is, the nature of a wick. Granting that it might be made of asbestos, and thus rendered indestructible, it would, after the lapse of some time, become so charged with half-decomposed fuel, as to form a semi-solid mass, which had lost the power of imbibing the oil in sufficient quantity to sustain the flame. A final objection lies in the want of fresh air. With a perpetual flow of oil, and a wick, if it were possible, so made as to obviate the last objection, the lamp, without a renewal of the exhausted oxygen of the tomb, would speedily become extinct. This appears to have been the case with the lamp discovered at Barblon. Such is the presumptive, such the positive, evidence opposed to the perpetuity of the sepulchral lights.

Learned men, however, have perplexed themselves much in the attempt to explain away the difficulty. The penetrating genius of Baptist Porta exercised itself in vain upon this subject: he believed in the truth of the accounts, but failed in all his experiments to produce anything like an eternal flame. Bishop Wilkins suggested the idea of the asbestian wick, and innocently asks, whether it was not probable that an *inconsumable* oil might not be extracted from asbestos itself?—which seems a kind of *lucus a non lucendo* reasoning. Dr Plat has suggested the idea, that a natural fountain of naphtha, or a jet of carburetted hydrogen, might be in connexion with the lamps; but this hypothesis is open to the objections—first, of the want of renewed air; and secondly, of the entire absence of any mechanism attached to the lamps to justify the supposition, even if there had been any such natural supply, which has never yet been alleged in any instance with which we are acquainted. Mr Way writes—'Some substance may have been compounded, which, long closed up amidst the pestilent vapours of the tomb, may at length, on the admission of some measure of purer air, have become ignited for a brief space of time, and as quickly have been extinguished, when, on being brought forth from the vault, an accelerated combustion had been produced.' Now, it is well known to chemists that some substances may be so prepared as to take fire on the admission of air to them, as in the numerous chemical playthings known as *pyrophori*; but these

must be rigidly excluded from the air, in hermetically-sealed glass tubes, or they become slowly oxidated, and are useless; therefore the objection to Mr Way's hypothesis is insuperable, as no substance could be exposed even to the impure air of the tomb without undergoing, in the course of ages, a slow oxidation, and thus becoming incombustible. It is remarkable that the same idea suggested itself to the mind of Porta, who was well acquainted with the tartrate of lead pyrophorus; but he candidly admits that it will not solve the difficulty.

The solution we would venture to offer (supposing that light is actually seen on breaking into any crypt or sepulchre) is the following, though it cannot be much pressed:—The gas *phosphuretted hydrogen* is the product, in certain circumstances, of the decay of animal substances, and instantly shines with a phosphorescent light on coming in contact with air. Is it not probable that the decaying remains* deposited in the grave may have, in the course of years, been slowly evolving small quantities of this gas? Let the tomb be supposed to contain some of this gas, and an extinct sepulchral lamp: some labourers break into it, the air falls upon the luminiferous gas, and the vault is filled with light, which the ignorant intruders refer to the lamp it enables them to distinguish; they seize upon the lamp, and presently the light disappears, the whole of the phosphuretted hydrogen has been consumed, and the vault is in darkness. The idea is perhaps worth entertaining, and appears to afford a simple and not improbable explanation of a long-lived archaeological chimera.

OUR CORRESPONDENTS.

Our late article on this subject has brought us a number of communications, some of them odd enough.

A person in humble life, writing from a village in the north of England, asks what book we would recommend him to employ to teach his mother to read. She is, he says, upwards of fifty years of age, and is desirous of being instructed in the art of reading, 'which will be a great comfort to her, and an act of gratitude from me.' We have suggested a Primer, and hope that this dutiful son will enjoy the satisfaction of seeing his parent able to read her Bible and 'Chambers's Edinburgh Journal' before she quits this mortal sphere.

A correspondent sends us a scrap from a Birmingham newspaper, containing an impression of a woodcut, representing one of the labours of Hercules—the seizure of the stag. This cut purports to be a drawing of a testimonial in silver, presented to Mr Lines, drawing-master, by his pupils. The engraving, which is in outline, with a little shading, is stated to have been drawn and executed by Master James Grove, with no other knowledge of the art of woodcutting than what he derived from a halfpenny Tract in 'Chambers's Miscellany.' We congratulate the young artist on his taste and perseverance. All things considered, his execution is remarkably good: we have seen worse cuts from practised and taught hands. His success shows what can be done by self-reliance, and an earnest desire to overcome difficulties. We are glad that the directions given in the above-mentioned Tract have been of some little practical utility.

Speaking on this subject, we are reminded of a communication received a few days ago from a gentleman in Gloucestershire, who deprecates our bringing the 'Miscellany' to a conclusion, as announced, at the twentieth volume. A few passages from his letter may be extracted. 'I have for some time circulated your Tracts among at least a hundred families in West Gloucestershire, who peruse them with intense interest. I also give them as rewards at the church Sunday school, or for writing out of school hours in winter evenings. You should see how the poor ignorant lads will work to get them, and how they read them aloud at the cottage

firesides to father, mother, and the family circle, who, when young, had not the advantage of learning to read like them. Several clergymen of the church of England, and some of the religious denominations, find them equally useful for distribution. We all agree that "ignorance is the parent of vice," and are pleased with the means you adopt to conquer that evil.'

It is gratifying for us to know that our 'Miscellany of Useful and Entertaining Tracts' finds its way at least in one quarter of the country into the hands of the class for whom it is specially designed. We regret that, consistently with other duties, it will not be in our power to extend the Tracts beyond twenty volumes; but within that compass, we hope, will be found as ample a variety of instructing and amusing matter as could reasonably be wished. A unique little library will have been furnished, fitted alike by its character and price to seek for a welcome at every fireside.

The above correspondent, who seems to be an enthusiast in popular instruction, concludes by mentioning that he prints short pithy addresses on pieces of paper, to distribute in cottages and elsewhere; and the reading of which, he says, 'has a good effect.' He encloses one of these addresses, printed in small quarto, within an ornamental border. It is headed 'FRESH AIR,' and is as follows:—

'The celebrated Dr Darwin was so impressed with a conviction of the necessity of good air, that, being very popular in the town of Derby, once on a market-day he mounted a tub, and addressed the listening crowd. "Ye men of Derby, fellow-citizens, attend to me! I know you to be ingenious and industrious mechanics. By your exertions, you procure for yourselves and families the necessaries of life; but if you lose your health, that power of being of use to them must cease. This truth all of you know; but I fear some of you do not understand how health is to be maintained in vigour—this, then, depends upon your breathing an uncontaminated air; for the purity of the air becomes destroyed where many are collected together—the effluvium from the body corrupts it. Keep open, then, the windows of your workshops, and as soon as you rise, open all the windows of your bedrooms. Inattention to this advice, be assured, will bring diseases on yourselves, and engender among you typhus fever, which is only another name for putrid fever, which will carry off your wives and children. Let me again repeat my serious advice—*open your windows to let in the fresh air.* Remember what I say; I speak now without a fee, and can have no other interest but your good in this my advice."

Next comes a letter from our old acquaintance Grant Thorburn, the original of Galt's Lawrie Todd, who still survives in New York. Grant is an oddity. Fifty-two years ago, while a young man, he left Scotland to seek his fortune in America, and we believe he has not sought it in vain. Pondering on things long gone by, this little old man bethinks him of a usage which he supposes might be advantageously introduced into Scotland from America, and we are to be the channel of its introduction. It is this. In America, it is customary to shake one or two bundles of loose straw into a grave over the newly-lowered coffin, in order to prevent the rattle of stones and earth upon the lid, which is always ungrateful to the feelings. Grant is rather late in telling us of this custom, but his communication is not the less welcome. In Edinburgh (and probably elsewhere in Scotland) it has for several years been the practice for the sexton to throw a quantity of straw into the grave before shovelling in earth: perhaps our notice of the fact, however, may carry the usage into quarters where it has not hitherto been known.

A letter from a bookseller in a town in the west of Scotland, informs us that he has for some time attempted to employ men in poor circumstances to go about selling cheap publications on the plan recommended by us, but that nearly all his efforts have been unsuccessful. 'The men,' he says, 'would do well,

* It is not forgotten that these consisted principally of cinerary matter.

and make money, if they could keep from drinking whisky. I have often set them up in trade, and they have almost invariably shown me ingratitude for my kindness, by perishing the pack through dissipation.' How frequently does this appetite for drink frustrate every means that can be adopted for improving the condition of the humbler classes! We thank our correspondent for his obliging communication.

Our article, 'A Word on Land,' has not pleased the parties who are concerned in leading the working-classes into a notion that the acquisition of an acre or two of land is to render them permanently comfortable and independent. We should have been very glad to see, by statements and calculations, that the project we discommended is really to turn out favourably; but unfortunately no attempt is made to prove anything of the sort. Our observations are met only by personal abuse, and we are denounced as 'aristocrats'—rather an amusing accusation, considering what we have been about during the last fifteen years. Not, however, even to gain the applause of the parties who now address us, will we stoop to flatter prejudices, or desist from exposing what we consider fallacies in social economy. A section of the working-classes may cease to look on us as friends; but we shall not the less act a friendly part towards them. We therefore, at whatever risk of offending, repeat our warnings respecting community land-buying projects and patch-farming, as means for regenerating the operative classes of the United Kingdom. And this, surely, we can do without in anyway approving of the present system of land tenures, or of the conduct of landed proprietors generally. We think, on the contrary, that on both these points there is a vast deal to condemn and improve, as we hope at a suitable opportunity to show.

A late article on Quack Medicine Advertisements appears, from various communications, to have given so much satisfaction, that we should infer the existence of a wide-spread sympathy on the subject. The growing detestation of such advertisements will surely shame the newspapers into dismissing them from their pages. A dealer in ———'s Pills writes to say that, from conscientious convictions, he is disposed to relinquish their sale; and we hope all respectable tradesmen will follow his example. No honest man, on consideration, can lend himself to the deceptions of the quack medicine manufacturer. That nearly half a million sterling should be spent in the United Kingdom annually on quack nostrums, which are either for the most part useless, or injurious to health, shows the extraordinary amount of ignorance and credulity that still requires to be removed.

Though not so numerous as formerly, questions as to fields of emigration continue to be put to us. Latterly, we have had great difficulty in offering any advice on this subject. At one time we felt warmly disposed towards different colonial possessions, but now shrink from the responsibility of recommending any one to go thither. This is not the place to speak of the strange method of managing the colonies, few of which, we regret to say, are without some kind of grievance to vex their inhabitants or retard their prosperity. In place of forming vast and suitable fields for the reception of an avowedly overplus home population, they seem, for the greater part, to be only engines of expense to the parent state. Possibly a more rational and beneficent policy may still make them a desirable resort for emigrants. But our feeling in the meanwhile is to counsel no one to peril his fortune within them. We would rather incline to recommend the United States of America as the most favourable, all things considered, for the purposes of the emigrant. For agriculturists with capital, the valley of the Mississippi offers scope the most boundless and profitable. Formerly, produce was disposed of with difficulty for want of demand; but now that a market is open in the British islands, agriculture in America will rise to importance and dignity, and the quantity of land which will be torn from the wilderness, and thrown into crop, will be immense.

Now, then, is the time for those who wish to take a hand in this great transatlantic movement. That Western Canada will participate in the advantages of this new trade, there can be little doubt; but the stoppage of traffic between the interior and the sea-coast for several months in the year is a serious drawback. A railway is talked of to make Canada independent of the St Lawrence, and were this effected, the colonial farmers would have cause for rejoicing. In Canada, however, they talk a long time before doing anything; and, like the Irish, they are too much in the habit of looking to government to assist in projects which they should execute by their own industry. The outlet from the whole valley of the Mississippi, including the valleys of the Ohio and Missouri, is open all the year by way of New Orleans.

THE BROKEN CHESS-PAWN.

MANY years ago, I formed one of a happy family circle seated round the tea-table. A letter had that day arrived, which, with the observation and quick instinct of a child, I guessed in some way concerned myself. 'It will be a pleasant change for her,' said my father, glancing at me. These were words enough to quicken my curiosity, had it not been all alive before; and I was busy picturing to my mind what this pleasant change might be, when my mother set the matter at rest by saying, 'Alice, your Aunt Walton has invited you to spend a month with her, and we think of allowing you to go.' A month in the country, and in June! What young heart, that has been nurtured in a town, does not thrill at the mention of it? I could scarcely restrain my delight, and ran about the house telling every one of my anticipated visit.

My Aunt Walton was a widow lady, living in a fine old country-house at some distance. She was a great favourite with all her nephews and nieces, being herself extremely fond of children, and I had always heard her spoken of as one of the kindest, gentlest creatures on earth. It was a fine sunny morning when I was put on the stage-coach that was to take me to a small town not far from my aunt's residence. Having never been able to travel in a close conveyance, I was given in charge of the coachman, and had a seat on the outside. People may say what they will of the superiority of railway travelling to the old coach system, but say, ye lovers of speed and steam, when flying along through narrow ravines, or gloomy tunnels, or even when a distant and fleeting glimpse of the country is obtained, what know you of the delights of travelling?

No loud bell or shrill scream ushers the stage-traveller on his journey, but the winding horn of the guard, and the loud crack of the coachman's whip. Once out of the town, and how beautiful the scene! It is early morning, the sun is drinking up the dew of night, and the sweet perfume of flowers is wafted on the breeze. The lark is singing his matin song, now ascending higher and higher, then falling like an arrow to the ground. The cattle are quietly grazing in the fields, and the haymakers are just commencing the labours of the day. Many a mile has sped pleasantly away, when, hark! the horn sounds. We are approaching a village, where fresh horses are standing waiting our arrival. The business of the day is now begun; all seems life and activity; yet the girls, with their brooms sweeping the cottage floors, rest a while to gaze on the coach as it passes by. At a little distance rises the village church, and there the quiet little parsonage lies basking in the sunshine. The horses are changed, and we start again, merry-looking urchins waving their caps in the air, or maybe hanging on behind, till the whip of the coachman drives them scampering back. And then the vehicles and travellers met on the road: now a sturdy wagoner with his lumbering team; then a troop of gipsies stretched idly on the grass, the youngest of them starting up, and running for some distance by the coach window; now an old woman, with scarlet cloak and

large basket on her arm, trudging to the village for sundry necessaries; then a group of merry faces in a gaily-decked wagon, setting off on a picnic excursion. These, and many more, were the sights which met my view on the way to my Aunt Walton's residence, and I have never forgotten them. Ah! but the reader may say, stage-travelling in the winter! Give us a picture of the unhappy outside passenger, half-frozen to his seat, vainly endeavouring to keep out the cold blasts, with rain or hail pelting him in the face, or perhaps a heavy fall of snow, and the coach at last brought to a standstill. Gentle reader, having never been in such an unfortunate situation, I cannot describe it; I will only say, I think I have heard very similar complaints from certain third-class travellers. I belong to a generation that is fast dying away; the world is changed now from what it used to be; people cannot stay quietly at home; they must be going here, there, and everywhere. Well, if they like it, I would be the last person to prevent them, only it was not so when I was young.

I know a dear girl, to whom I sometimes talk in this strain; and she laughs, and says those barbarous times are gone by; and that railways make people more sociable by bringing friends oftener together; and make nations too more sociable, so that we shall soon have no more wars, and

'The pen shall supersede the sword,
And right, not might, shall be the lord;'

and I don't know what happy things she does not prophesy. She says she belongs to the new generation; and I think she does, for I never heard people talk so: but I daresay she is right, for she reads a great deal more than I do, and I know so little of what is going on in the world now. But this is wandering from my story. All journeys end, and mine did at last. I reached my aunt's residence, and a fine old place it was, with its terraced garden and massy stone porch. And then the rooms! I had never seen such rooms, so large and lofty, with polished oak panels, round and finely-carved ceilings. And the paintings! Family portraits looking as antique in their curious costumes as the house itself. My aunt received me very kindly, and I soon began to feel quite at home; and often, as she was sitting with her knitting, would I take my place at her feet, and read aloud from the large family Bible, which always lay on a table near her.

At times, laying aside her work, and pointing to the portraits on the walls, she would tell me the history of many who had lived in that house before her; and so much did these stories fill my childish mind, that often, when wandering through the long galleries and rooms that were seldom entered, I have almost expected to meet some of those fair beings whom the portraits, and my aunt's vivid descriptions, had for ever impressed on my memory.

One day I was standing behind my aunt's chair, when I took hold of a black ribbon she wore round her neck, and which seemed to be attached to something hidden in her bosom. I had often looked at it with curiosity, and now asked her what was at the end of the ribbon. She smiled, and said, 'You would never guess;' and then added, 'sit down, my child, and I will tell you. You are fond of stories, and this is a true one. When I was young, I was very proud and passionate.'

'Yes, aunt!' I interrupted her in astonishment. 'Passionate—that kind, serene, old lady whom I had never seen even ruffled!'

'Yes,' she continued; 'you would not have doubted had you known me then. Many an anxious hour did I occasion my parents, and many a time did they talk to me of the sin and folly of giving way to temper; but it was in vain. I thought that passion and resentment were an evidence of spirit, and of all things, I hated a tame-spirited person. Books were not so common then as they are now, and we had little to employ our time with but embroidery. I was therefore delighted when a kind friend from London taught me the game of chess,

and gave me a box of men; and many a long evening passed pleasantly away whilst I was engaged with my brother in our newly-acquired game; the only drawback to our pleasure being, that my father, for some reason, never liked to see us engaged in it. One day (it seems but yesterday), I had seriously offended him by allowing something to be destroyed which he greatly prized. My father was a man of even temper, and I never remembered having seen him in a passion; but now he was roused, and saying, "If you care not for what I value, neither will I for what you do," he caught up my chess-box, which lay on the table, and dashed it on the floor. I looked at him in amazement: I thought not of the chess-men, but of him and of myself. I saw how he had degraded himself before me; it was a passionate act, but it was also a mean one. That single action taught me more than all the reproof I had ever received, for I learned that passion was mean and humiliating; and if thus my father appeared before me, so must I also appear before others. The chess-box still lay upon the floor—the cover had not fallen out, and apparently no mischief had been done. Quietly rising from my seat, I picked up the box, and left the room to examine its contents. The men were all safe, save one, a pawn. I looked at this broken pawn, and made a resolution, that as long as I lived I would preserve it—it had taught me a lesson which I hoped never to forget.'

Here my aunt drew the ribbon from her bosom, and I saw attached to it a broken pawn.

'And is that the very same?' I asked with surprise.

'It is,' said my aunt. 'I have worn it ever since; and whenever tempted to give way to passion, this little piece of ivory has exercised over me an almost magical power. Heaven blessed my endeavours, and though the struggle was often severe, in the end I was the conqueror.' Then taking my hand in hers, she added in her softest, kindest tone, 'Whenever, dear Alice, you feel inclined to give way to passion, think of my story, and of the Broken Chess-pawn.'

GOVERNMENT APPOINTMENT HUNTING.

A FEW weeks ago we presented the contribution of an Irish gentleman, ridiculing the too common practice among his countrymen of *waiting for a commission*, instead of betaking themselves earnestly to some line of private enterprise. The practice, however, of waiting for appointments of a similar kind, and also for civil offices under government, is, we lament to say, far from uncommon in Great Britain. On this subject the 'Manchester Examiner' made lately some suitable remarks, which we take leave to lay before our readers.

'Amongst the various "popular delusions" which prevail in this country, as well as in many others, there is one which has been little dwelt upon by public writers, but which is, nevertheless, well-deserving of exposure—we allude to the belief which has long been entertained, that there is at the disposal of the executive government an inexhaustible fund of patronage in the shape of government appointments. The Post-office, the Customs, and the Excise, are the grand avenues through which men hope to find the way to a permanent settlement, and to comfortable quarters for life. We should like to have the opportunity of seeing a list of the letters of application which are received in a year, or in a single month, by some of the members of parliament now sitting on the ministerial side of the House, from such of their constituents and others as are anxious to devote themselves to the service of their country. At this moment, we doubt not, there are in the United Kingdom some thousands of individuals who are indulging the fond expectation of becoming servants of the state, and who are spending months, or even years, in the pursuit of this the darling object of their ambition and their hopes. They fix upon some member of parliament who is supposed to be on good terms with the ministry of the day, and most commonly on the representative of the borough or county in which they reside, and for whom they have given, or expect to give, a vote, and through his intercession they entertain sanguine hopes of success. They write their unfortunate member a pressing request that he

will interest himself on their behalf, and express their confidence in his kindly feeling towards them, and in his power to further their views. They wait his answer with great anxiety; and when it comes, with an indefinite expression of good-will and of willingness to serve them, they are buoyed up with the hope that he is doing all he can to assist them. The most importunate are not content with writing, but actually make a journey to town to press the matter more strongly upon him; and at his lodgings, or his club, or in the lobby of the House, they besiege him with solicitations for his interest with the ministry he supports. In addition to these efforts, they get up memorials signed by influential electors and others, testifying to the merits and capacity of the applicants, and hope by these means to force the gates which lead to the "fools' paradise" of a government appointment.

'We need not dwell on the miseries of waiting for that which, however ardently hoped for, is almost, and, in most cases, absolutely impossible to be attained. That men have written, memorialised, and implored for months and years, and have at the last been grievously disappointed, is known to everybody at all acquainted with the interior of government offices, or with the routine life of an unfortunate member of the legislature. That men should still go on seeking to dig for gold, where, in ninety-nine cases out of every hundred, no gold is to be found, is only another instance, added to multitudes besides, where people resign themselves to the delusive expectations of success in a lottery, and neglect the solid prizes which offer themselves in so many other directions. To show how desperate is the chance of success in the lottery of government appointments, we need only state a fact which is within our own knowledge, that at this moment there is a list of applications for places in the Post-office alone, which contains upwards of two thousand names, and that a list of names, selected from these, numbers some seven or eight hundred strong! But even this formidable array is not equal to the applications which are received at the treasury. We have no means of knowing accurately the exact number of names in the books in that department, but we do know that they amount to several thousands, and that, in connexion with one class of appointments altogether very limited in number, the letters of solicitation received within the last six months would fill a large hamper.

'There are several points to be observed with respect to these applications. They come generally from men who seek an easier way to comfort than is afforded in the ordinary channels of industry, and very often from those who have failed to succeed in other and more independent pursuits. They hold out the prospect of a permanent, and, it is generally supposed, of an easy mode of obtaining a living. We pronounce the whole system of "appointment hunting" to be a great "popular delusion," causing much mischief to those who are imposed upon by it, creating corruption among constituencies, and involving an incredible amount of labour and annoyance to the members of the legislature. From long observation, we have come to the conclusion that ninety-nine out of every hundred who apply are doomed to disappointment, and that of the few who succeed, the majority might have been more wealthy, and much more independent, if they had devoted their time and energies to some of the many branches of trade or professions by which the millions of our population secure a competent and honourable subsistence.'

THE GOOSEBERRY.

In Spain and Italy the gooseberry is scarcely known; in France it is neglected, and little esteemed; in some parts of Germany and Holland the moderate temperature and humidity of climate seem to suit the fruit; but in no country is its size and beauty to be compared with that produced in Lancashire, or from the Lancashire varieties cultivated with care in the more temperate and humid districts of Britain. Dr Neill observes, that when foreigners witness our Lancashire gooseberries, they are ready to consider them as forming quite a different kind of fruit. Happily, this wholesome and useful berry is to be found in almost every cottage garden in Britain; and it ought to be considered a part of every gardener's duty to encourage the introduction of its most useful varieties in these humble enclosures. In Lancashire, and some parts of the adjoining counties, almost every cottager who has a garden cultivates the gooseberry with a view to prizes given at what are called 'Gooseberry Prize Meetings,' of which an ac-

count is annually published, with the names and weight of the successful sorts, in the 'Manchester Gooseberry Book.' The prizes vary from ten shillings to L.5 or L.10—the second, third, even to the sixth and tenth degrees of merit, receiving often proportionate rewards. There are meetings held in spring to 'make up,' as the term is, the sorts, the persons, and the conditions of exhibition; and in August to weigh and taste the fruit, and determine the prizes. The perfection the Lancashire berries have attained owes nothing to men of scientific knowledge, being cultivated scarcely by any but the lowest and most illiterate members of society; but these, by continual experience and perseverance in growing and raising new sorts, have brought the fruit from weighing ten to upwards of thirty pennyweights, and that, too, under the greatest disadvantages, not having the privilege of soil, manure, situation, &c. like the gardens of their more wealthy neighbours, but oftentimes limited to a few yards of land, either shaded by trees, confined by buildings, or exposed to the most unfavourable winds, and so barren, that they have frequently to carry on their shoulders a considerable way the soil in which the plants are to be set.—*Gardener's Monthly Volume.*

SLANDERE.

It is almost as criminal to hear a worthy man traduced without attempting his justification as to be the author of the calumny against him; it is, in fact, a sort of misprision of treason against society.—*Junius.*

THE THREE STAGES.

BY S. W. PARTRIDGE.

It was a happy group. The honest pair,
Followed by many a blessing and kind wish,
Trod lightly down the elm-embowered walk
Towards the ivied porch. The conscious nurse,
Big with the deep importance of her charge,
Folded with careful arms the tender babe,
Round whom so many budding hopes did cling.
Oh what a heaven was in that smiling face,
As, throwing out its dimpled hands, it peeped
From out its flannel nest! What deep pure joy
Seemed swelling that young heart, as, yet unstained
With passion or with care, it gazed abroad
With its blue eyes upon the arching trees,
The sky, and the green earth!

It was a merry group. Twice twenty years
Had left unchanged that row of towering elms.
But oh how changed was he who 'neath their shade
Lied, fondly leaning on his stalwart arm,
His young and blushing bride! The gossip round,
Uncovered, bowed before him as he passed;
For he was wealthy, had his numerous flocks,
And acres stretching far for many a mile.
He had become a shrewd, far-seeing man,
Learned in ledgers, big with calculations,
And deeply read in this world's sapience;
But on this morn, his marriage morn, he sung,
Forgot his speculations for a while,
His pains and losses, and paced blithely on,
Exchanging many a jest with friends around,
To the old hoary porch.

It was a mournful group. The sun shone out,
Lusty and young as sixty years before,
But he who then had twinkled his young eyes
In its bright beams, was now all sadly borne
To the cold grave. There was a motley crowd,
More curious than loving, and a train
Of dry-eyed mourners, full of bursting thoughts
Of wills, and title-deeds, and legacies,
Of heirs and next of kin. One, one there was,
Whose heart wept o'er him, though she was not there,
Whose bosom throed with one big thought—her husband;
And no one mourned beside, but hurried on,
With decent coldness and grave unconcern,
And laid him down by his unconscious sire
In the dark dustful earth.

WALKS IN WESTMORELAND.*

SOME years have elapsed since, in fulfilment of a tryst with one of the most accomplished of England's daughters, I passed a fortnight exploring, in her delightful society, and under the privileged auspices of the best of country pastors, not only the general features of the lakes of Cumberland and Westmoreland, but, in a series of daily rambles, the primitive rural district in the immediate vicinity of Windermere.

Contrary to tourist routine, our line of march from Penrith led us first to the foot of Ullswater, one of the wildest and largest of the beautiful sheets of water whose widely different character imparts to them such varied interest. From the paragon of princely village inns at Pooley Bridge we took a boat, and were rowed some half-dozen miles up the lake, so as to obtain a view (though, alas! a too distant one) of the nobler scenery towards Patterdale. That circumstance probably weakened the effect of this highly-extolled lake, which, spite of its extent, and many fine points, struck us as overrated, and, even to a Scottish eye, deficient in wood.

Pursuing a bad but beautiful road up a steep ascent of eighteen miles to Keswick, we enjoyed from it the most exquisite views of the lake and mountains round. Saddleback struck us as finer, from this point at least, than Skiddaw, and the general aspect of the range continually reminded us of Scotland. Grandeur rather than beauty characterised the drive, and less wood was everywhere visible than in the Highlands.

Passing the valley of St John, whose 'castle rocks,' and the novel spectacle of nature for once imitating art, are so graphically depicted by Sir Walter Scott in the 'Bridal of Triermain,' we arrived at Keswick, and passed a lovely evening in delicious contemplation of the gem, in my opinion, of all the sisterhood of lakes. A seat beneath two trees, looking up Derwentwater, affords the most faultless combination of scenery I ever remember beholding. The hills, piled in the happiest confusion, tier above tier; a woody island in the foreground; and a circular basin, glowing with the evening sun, reflecting every peak around.

We allowed our guide to unmoor one of the many fairy skiffs fastened to the sunny bank, and glided across to the island—a perfect insular paradise, with all its fresh fragrant shrubs unpolluted with dust, and sheltered from every blast. From the windows of the villa the prospects are indescribable. I could not help regretting that this Eden was not, instead of being the rare occasional abode of a luxurious idler, the permanent residence of the poet Southey, whose prosaic actual

dwelling, a suburban-looking box close to the town of Keswick, disappointed me much.

Far different was the aspect of Rydal Mount, the meet abode of Wordsworth (of which more hereafter), when passed the following day in the course of a drive unequalled perhaps for variety and contrast within the same narrow bounds. Our parting peep, caught from a steep ascent, of Derwentwater, lying as cool and clear in the morning air as it had been warm and glowing the evening before, reminded me strongly of the character of some Swiss valleys, nay, even of more desolate gorges in our own mountains, part of the drive much resembling the approach to Glencroë. About Grasmere and Rydal, again, one might fancy one's-self in the milder vales of Switzerland; while some hours of luxurious enjoyment on a bank above the inn at Lowood, with the glittering expanse of Windermere full in view, recalled, though as in a miniature picture, and wanting the noble mountain framework, the island-studded mirror of Loch Lomond. Windermere, beautiful as it is, is a lake to be loved and enjoyed, rather than gazed and wondered at. It should perhaps be seen—if to be seen merely—the first of the group to which it belongs, as the others far exceed it in wildness and sublimity. But on the banks of none would one be more inclined to linger, or even finally to set up one's rest. The village of Bowness, our resting-point, is the *beau idéal* of an English hamlet—neat, clean, cheerful, and embowered in roses; with one of the most picturesque and venerable of churches, and a modern Gothic school, towering on a cliff beyond it, and adding a new feature to the before perfect picture.

The hotel (Ullock's) where we resided, and were as much at home as in our own several places of abode, has every recommendation an inn can possess—comfort, cleanliness, civility, good fare, moderate charges (its celebrity notwithstanding), and a degree of quiet perfectly incomprehensible. For though overflowing with hourly accessions of company, no rude sound of 'chambermaid,' 'boots,' or even 'bells,' is ever heard to disturb the home stillness of this *dearest* (in the best sense of the word) of hostelryes.

Our apartments opened on a beautiful little green terrace or platform above the lake, on which, at morning or evening, it was luxury to lounge, the autumnal coolness of the air, and ever-shifting varieties of cloud and sunshine, forming a continual feast to the senses.

And now for the result of the rambles before alluded to, in the cottage anecdotes, gleaned while accompanying the most popular of pastors in his accustomed visits of benevolence among his people, and noted down verbatim on the spot, which may probably, by lovers of character, be deemed their chief, if not only merit.

No. 1.—A beautiful clean picturesque cottage, remarkable even in a country where all are more or less

* This article is from the pen of a respected female contributor, *slightly* not unknown in literature.

so. Cheerful window, commanding within its rustic framework such a view of lake and mountain as an artist might walk miles to procure. The curiosity of the house, however, is its ancient mistress—a nice, clean, lively woman, the very image of thrift and good housewifery, but the remotest in appearance from having in her mind either music or sentiment. We found, however, that this mind was the residence of both; for on our remarking a fiddle suspended against the clean whitewashed wall, the handiwork of her son—one, she told us, 'of a right musical family'—she tripped nimbly up stairs, as if the very word 'music' had awakened the latent propensity of her earlier years, and brought down a venerable dulcimer (the first of its species which any of our trio had ever beheld), and on our inquiring its age, answered characteristically, 'I haae played on't some five-and-fifty years or more. I played on't at four year auld, and I'll be sixty t'morn.'

She forthwith suited the action to the word, and though with hands absolutely distorted and numbed by rheumatism, displayed much of the dexterity and execution which must in youth have rendered her the Paganini, if not of 'Abyssynian,' at least of Westmoreland maidens. The instrument—in shape a sort of oblong, with the sides bevelled off like an antique window seat—had ten rows of strings, and was played with two quills. These the old lady moved about with singular agility, jumping, with squirrel-like leaps, from row to row of strings, and progressing, from no contemptible imitation of a chime of church bells, to such rapid evolutions as are required by an Irish jig.

Considering that she played by the ear, had every joint stiffened by rheumatism, and had nearly abandoned the art for the last twenty years, her performance was really wonderful. Her instrument being sadly out of tune (which, to do her ear justice, seemed to shock it greatly), we asked if any one could remedy the defect; and she said there was only one old man at Bowness sufficiently gifted, if his fingers were still capable of performing the task. We exhorted her not to let the art die with her, but instruct one of her grandchildren; on which she rejoined, with the invariable prefatory ejaculation of her country, 'Well, and music is a harmless thing! I used to play in t'moonlight when I was a girl, and my father gone to's bed!' and this with as little idea of being sentimental, as if she had said she supped on bread and cheese.

We were invited up stairs to enjoy in more perfection our favourite view, and the landing-place exhibited, besides the precious dulcimer-case, a curiously-carved writing-desk of 1624, and an elegantly-turned old oaken spinning-wheel, quite fit for a dowager duchess of sixty years ago.

No. 2 was a picture of a very different description. We had seen a Westmoreland peasant woman of the better class, in the decline of life certainly, but still in the enjoyment of tolerable health and unimpaired activity of tongue and limb. We were now to witness the sad effects of disease on one of the most notable and stirring of housewives. It was by the presence of the benevolent clergyman that all our intrusions were sanctioned; and this was evidently one of the last earthly visits the mistress of the cottage would ever receive.

Crouching over the expiring embers of a fire sat a pale emaciated woman of about fifty, in the last stage of decline, patient, and prepared for her change, yet dwelling with pardonable minuteness on the details of her previous domestic trials and present illness. These derived from her death-like appearance, and the peculiarly expressive and idiomatic language of the country, an interest incapable of being transferred to paper. A strong remnant of Saxon words pervades the dialect of this part of the country, several instances of which occurred during the day.

Her husband, a small farmer, she said, had lain two years a martyr to rheumatism, during which he never 'saw to mither corn nor hay.' A double portion of out-door duty, in addition to her daily and nightly

nursing, of course devolved on her, and to these exertions she had now fallen a victim; her husband in the meantime having been restored to health by her energetic proceedings in carrying him to a 'rubbing doctor' at Preston. The clergyman, in his own mild way, gave her a few words of pastoral consolation; while my gifted companion (the little attendant maiden having been scared away by the 'gentlefolks') blew up the fire, first filling at the brook, and then heating, the tea-kettle, and administered the welcome refreshment with a cordial kindness peculiarly her own.

It was a comfort that, in a worldly point of view, the poor woman wanted nothing that money could procure. She spoke with pardonable pride of having expended twenty pounds for regular advice during her husband's long illness, and nearly as much more to a popular quack; and wine being prescribed for her, she said 'the measter' (the invariable country name for husband) was to 'fetch her a fresh quart to-morrow.' A few more morrows would probably close her earthly wants and sufferings.

No. 3.—The transition was sudden—shorter even than the bit of meandering meadow-path connecting the two cottages—between the stillness of 'life's warfare all but ended,' in the person of our shrinking and helpless last hostess, and an almost appalling vigour and energy in that of our next one; the very tallest woman I ever remember to have looked upon, whose gaunt bony figure was equipped for the hay-field in very scanty drapery. She literally touched the beam of her own cottage roof, and reminded one, in all but grace, of an antique Caryatide of some of the severer styles of sculpture.

The redeeming character of this hard-favoured Glum-dalclitch, was her perfect good-humour and cheerful cordiality of welcome; while the confiding minuteness with which she and other parents enlarged to the 'parson' on the little ailments, or progress in learning, of their children, as well as the universal smile that beamed on every face at sight of him, spoke volumes for his estimation among a people to whose simplicity flattery seems unknown, and who in most cases express a great deal less than they feel.

No. 4.—If good-humour and energy had been pleasing even under the rude exterior of the Westmoreland giantess, they were of course doubly attractive in the person of one of the prettiest young wives and mothers that ever cheered a peasant's fireside. It would have been hard to say whether this comely young creature, whose girl of six years old might have been mistaken for a younger sister, was proudest of her children or her cheeses; which latter, ranged in a goodly row on the usual oaken shelf—the snowy whiteness of their polished sides set off by the still darker hue of the ancient smoke-tanned rafters—having attracted my attention, had each its individual merits pointed out to me with professional pride.

Everything about this *ménage* was bright and stirring, and shone through a sunny medium. The children's faces alone were grievously in want of washing—a rare blemish in this cleanliest of countries, where the very pigs seem to have undergone ablution; but, as she said, all the world had been at the hay, and 'better for the lile (little) ones to rout in t'dirt, nor to ail int' bed.' On my remarking that cheese-making seemed a toil-some mode of turning a dairy to account, she cheerfully answered, 'Oh, we munna look out for rought to be had wi'out trouble.' In short, it was impossible to look on her pretty modest face, and re-echo her cheerful good-night, and not congratulate John Richardson (still a-field) as a very enviable married man.

No. 5.—We were now to see assembled, under one cottage roof, a very galaxy of cottage virtues, with due accompaniment of cottage comforts. The pastor had warned us, in general terms, that his next visit was to a recent sufferer by a dreadful calamity, the object of it having fallen into the fire in a fainting fit, and been so burned about the face and hands, as to escape with life

at the expense of many weeks of intense agony. While talking a moment, within this peculiarly clean cottage, with its owner—a nice motherly woman, surrounded by children of all ages—a hearty greeting, in the most cheerful of human accents, announced the entrance of the convalescent invalid.

She was, notwithstanding all she had gone through—and 'words,' she expressively said, 'could never make known what she had a *bidden*'—a nice, hale, hearty-looking creature, whom no suffering could tame or calamity subdue; her eyes twinkling with scarce suppressed glee, and her lips overflowing with rich humour, only the more racy for being clothed in the indescribable vernacular of Westmoreland.

To the parson, as usual, all the incidents of her illness and recovery, which had occurred since his last visit, were graphically detailed; and one anecdote of herself was highly characteristic, Mr — told us, of her indomitable spirit and ready repartee. When her poor burnt hand, still disabled, and swollen to twice its usual dimensions, and very imperfectly skinned over, was incapable of the slightest motion, 'Ta doctor,' she said to us, 'had coom in like a crazy creature, and spreading his five fingers out before her face, had exhorted her to do the same. "Well!" says I, "gin I could ha' made a hand like his, I never wud ha' coom'd tall him!"' The arch humour with which she said this was a thing never to be forgotten, nor the light-heartedness and trust in Providence, and her neighbours' kindness, of a being dependent on her own labour for daily bread; and yet now content to owe it, with equal cheerfulness and right-mindedness on both sides, to the family under whose roof we found her (though no relation) a welcomed and cherished inmate.

On hearing of the accident, which occurred to her while waiting on a very old and infirm gentlewoman, a nice girl, whom we had seen, the daughter of our present hostess, had volunteered at the old lady's house some weeks of untiring and gratuitous attendance on poor Nelly; and when Nelly's mistress, with somewhat of the crabbed narrowness of age, had begun to tire of the burden, the mother of the girl had stepped forward and offered a home to the still totally helpless and houseless invalid. These traits, so honourable to the feelings of a people whose only national blemish is supposed to be a too great love of gain, or rather horror of expense, were related to us with sparkling eyes by their youthful pastor, who looked quite proud when, in answer to our questions about the date of the accident, the patient showed her sense of his familiarity with it by the appeal of, 'Thirteen weeks come Monday, ben't it, parson?'

I could not help on this, as on many other occasions during the day, envying one of the most accomplished of scholars and gentlemen the cordial affection of his flock, and the influence he has acquired, by the most legitimate and unostentatious means, over a population slow to form attachments, and proverbially incapable of exaggeration.

No. 6, which was perhaps, in point of local and provincial interest, the climax of our Westmoreland experience, was a visit to the house of a *bona fide* 'statesman'—a class of old yeomen fast wearing away, and losing, if not their paternal possessions, at least their patriarchal simplicity and independence.

Of this expiring genus, we could not have seen a finer specimen than old William Cholmondely; the gaunt but fine relic of one of the tallest and most powerful among the athletic race of Windermere.

The house and its inhabitant were in the most excellent keeping with each other. The latter, his face still *seren*, and his white hair streaming about in somewhat of its youthful luxuriance, strode out to his threshold, attended by two large sheep-dogs, which only wanted a hint to be uncivil. Though slightly deaf, old Cholmondely kept up a conversation full of rustic shrewdness and unabated spirit.

His hospitality was soon proffered, and the more

readily accepted, that some of the party had sacrificed to the walk the usual forms of dinner. Milk, warm from the cow, the delicious thin wafer-like oat-cakes—forming, strange to say, not the occasional relish, but staple food of every cottage, where whole days are devoted to their laborious preparation—and best cheese of the country, were quickly placed before us. As a sample of the liberality with which our repeated draughts on the former were sure to be 'honoured,' the goodly milking tub, in which the fluid had just been drawn from the cow, was introduced in full view on a side table, and jug after jug strained directly from it for our use; while the old host's still lively eyes twinkled with satisfaction at our apparent relish of his mountain cheer.

The house in the meantime well deserved a description. The state-room, or centre apartment, into which we were ushered, was wainscoted and roofed with oak, stained, by age, of the darkest mahogany, or almost ebon hue; along whose dusky rafters shone more brightly than usual an unwonted array of magnificent cheeses.

Before the wide antique chimney, clothed with its summer broiery of fresh boughs, literally gleamed, like newly-burnished weapons, a whole range of fantastic-looking andirons, of all shapes and sizes, adapted for suspending, at various undefinable angles, the pots and pans of some mighty Camachos' wedding-feast. But the crowning feature of this really imposing apartment, breathing centuries of yeoman comfort and respectability, was a gate of oaken railing, somewhat akin to that often placed by careful modern parents on the top of a nursery flight of stairs, which separated the actual parlour in which we sat from the main staircase, springing under a venerable old arch directly from it.

The immediate proximity likewise of this *chamber of dais* to the ample kitchen, and no less spacious dairy, which intervened between it, and the unfailing and picturesque Westmoreland outer-porch, spoke of a pleasing and primitive union between the business of rural life and the scene of its most privileged holidays. We departed, delighted with our glimpse into patriarchal life, and attended even beyond the 'door-stane' by our venerable host, who, expressing a wish to show us his 'beans'—no bean-field, as we supposed, but bee-hives; an evident corruption of the German word '*bienen*'—took leave of us at the gate of his little trim and well-kept garden. He was one on whose like, though the generation now flourishing in Westmoreland are still unusually tall and athletic, a traveller from less-favoured localities can seldom hope to look again.

Such were the glimpses of mountain cottage life with which one day's delightful ramble furnished us, and to which perhaps the scenery of the most loveable of neighbourhoods has lent a delusive charm. But whatever may be thought of the very humble pictures, which have little, save their truth and fidelity, to recommend them, all will sympathise in the delight I experienced in driving over to Rydal Mount, and the opportunity of seeing, unshackled by the forms of an ordinary introduction, the interior of a poet's home such as Wordsworth is privileged to inhabit.

Never surely were residence and man more exquisitely adapted to each other; nor, should I say, judging from their reception both of the intimate friends I accompanied, and of their interloping appendage, was poet ever blest with womankind more calculated to temper, by the friendly ease of their hospitality, the mixture of shame and awe inspired by trespassing (not involuntarily) on the den of such lions as Scott or Wordsworth. The urbanity of the latter under such trials I had no opportunity of appreciating, at least under his own roof, for he was absent on an excursion, whence he only returned in time to meet us in the act of quitting his premises. But in his wife and daughter he possesses auxiliaries who must at all times lighten to himself and others the 'ills' to which 'genius,' like (but oh how unlike!) 'flesh,' is heir to. Of the extent of these 'visitations,' some idea may be formed from

the circumstance of five parties, none of them specially authorised, having called during our afternoon visit; while a neighbour told me it was no very uncommon thing for the tea-table to be as often replenished with unexpected guests: so that double credit seems to be due to that unpretending kindness of the poet's fitting helpmate, and the playful grace, beyond the reach of art, of his accomplished daughter, which will long be associated with the other charms of Rydal Mount.

The house is just what and where it should be—sufficiently elevated above the beautiful vale it commands to be cheerful, yet abundantly sheltered and embosomed in its luxuriant canopy of trees and shrubs. While prolonging our visit, in the hope, not altogether frustrated (as far as a glimpse of his personal presence, the noblest perhaps ever borne by poet, as, with hat in hand, and his fine white hair playing in the wind, he stood beside our retreating carriage), of the return of the master of the house, I retired into a window of the charming library, to allow freer scope to the conversation of the more privileged friends of the family I had accompanied; and, under the irresistible influence of the view without, and the genius of the place within doors, gave vent to my feelings in verses which have, like the preceding prose, no other merit than being put down on the spot.

SONNET WRITTEN IN WORDSWORTH'S WINDOW.

What thoughts rushed through my mind, and stirred my heart,
While glad retiring even from kindliest sound
Of mountain welcome! Pleased, I sank apart
In yon deep window nook, and made the gems
Of earth, and air, and sky, for him enshased
By nature's lavish hands, within its bound
For one bright moment—oh, how brief!—mine own.
Methought, if thus in awful presence placed
Of giant mountain summits, caught through stems
Of ancient oaks, ungifted soul like mine
Aught of the poet's sacred joy could taste,
Aught of the hallowed spirit hovering round,
What marvel thus should glow through every line
The fires by Wordsworth lit at nature's shrine!

The tameness of the above lines may be redeemed perhaps by the raciness of a Westmoreland compliment to the bard, which was told us on the spot. A crazy woman, living near Rydal, was asked if she often saw Mr Wordsworth, and what sort of a man he was. 'Oh, indeed,' said she, 'he is canny enough at times; and though he goes *boozing his potterry** through the woods, he will now and then say, "How d'ye do, Nanny?" as sensible as you or me!'

NATURE AT WAR.

THE BALANCE.

In some former papers† we have given an account of the wars, offensive and defensive, of the lower animals; and we now desire to reconcile such apparent anomalies with the general scheme of nature.

It is manifest that there exists a limit to the over-multiplication of life on the one hand, and to its annihilation on the other. The earth can be proved to be capable of supporting no more than a definite number of living creatures upon its surface. If there is an excess, it will be cut down; if there is a deficiency, it will be supplied. In a word, there is a balance which holds the opposing powers in equipoise; a balance, one of whose scales is labelled 'multiplication,' the other 'subtraction.' Held by an Omnipotent hand, guided by an Omniscient Power, it may have its oscillations, but, as a universal scheme, its equilibrium is almost perfect; and at no period since the earth and its tenants sprang into existence, do the annals of natural history inform us that either scale has kicked the beam. If creatures drop out of the one scale, a compensating proportion of others will be added on to the opposite. Thus, while it is always under the direct control of the Author of life, it possesses all the elements of a self-regulating

principle within itself. To take a simple illustration in the initiative. A certain insect has had a certain plant appointed to it as its food; a season having some peculiar features will produce this plant in unusual luxuriance, to the exclusion, probably, of many that formerly shared the same area of soil with it. As a direct consequence of the increase in food, the number of insects is a thousandfold increased, the luxuriant plant is devoured by myriads of additional mouths, and is at last cropped down to what may be regarded as its normal status. The balance now rapidly inclines in the opposite direction, as concerns the equilibrium of vegetation, but it is again restored by the birth and increase of all the plants eaten out and smothered before. This is just an instance in which a redundancy of production brings its own check upon its back. In this case, and in many others, the balancing principle reacts also upon the very check itself: with the disappearance of the excess of sustenance the excess of consumption vanishes too, and the millions of busy insects die by a simple negation.

To extend our views. The balance of power reveals itself in both the great kingdoms of nature—animal and vegetable. Confining our attention principally to the former, and in some measure respecting a convenient division formerly made into carnivorous and herbivorous creatures, let us briefly advert in the first place to the balances of production and consumption subsisting in the mutual relations of animals—depredators and their prey. In sustaining the equilibrium of species, insects are very actively and very extensively engaged. There is a species of aphid which does incalculable mischief to plants, destroys the hopes of the orchard, and blights every tree upon which it alights, which finds a check in a splendidly glittering enemy known as the 'lion of the aphides.' This aphid lion was commemorated on a former occasion for its remarkable freak of imitating the destroyer of the Nemean monster, and clothing itself with the skins of its slain. Its ravages among these insects are only to be compared with the ravages of the latter upon plants, and are probably under-estimated in the comparison. The aphides have, fortunately for us, other enemies still. Kirby thus writes of the destruction caused by the caterpillar of another aphidivorous insect. 'It was but last week that I observed the top of every young shoot of the currant-trees in my garden curled up by myriads of aphides. On examining them this day, not an individual remains; but beneath each leaf are three or four full-fed larvae of aphidivorous flies, surrounded with large heaps of the slain, the trophies of their successful warfare, and the young shoots, whose progress has been entirely checked by the abstraction of sap, are again expanding vigorously.' Rolander made a remarkable discovery, which is a beautiful illustration of several links in our chain of argument. '*The Phalena strobilella* has the fir cone assigned to it to deposit its eggs upon; the young caterpillars, coming out of the shell, consume the cone and superfluous seed; but, lest the destruction should become too general, the ichneumon lays its eggs upon the caterpillar, which, being hatched, destroy the latter.' It has a remarkable apparatus with which it succeeds in this insidious attack: its body cannot enter into the cone, but it inserts its long delicate tail into an opening in the cone, until it succeeds in touching the enclosed caterpillar. The egg is then slid down through this tail, and posited upon the hapless larva, whose death then becomes inevitable. In the tail is placed a kind of borer, which, says Reaumur, they use as a carpenter uses his hand-awl, giving it a semi-rotatory motion in alternate directions. By this means the ichneumon is able to bore down to the nests of the mason-wasps; when it has bored quite down to the larva, enclosed in such fancied security, it lays the fatal spot upon it, and takes its leave, satisfied of the ultimate result. The ichneumon will also pierce the gallnuts which protect the slumbering parasite within, oviposit upon it, and depart. The service this little destroyer renders to man is incalculable: it pierces the covering with which the *Cecidomyia* or Hessian fly invests its progeny—an insect whose attacks upon wheat are the dread of every agriculturist—and thus nips this destroying

* Repeating his poetry.

† Journal, Nos. 158, 159, 162.

creature in the bud. It also destroys in a similar way the caterpillars, which consume the cabbages, and the genus *brassica* generally; both of them services which it is only just to acknowledge as among the most valuable rendered to man by the instrumentality of the world of insects. The processionary caterpillars have a tremendous enemy in an insect named the *caloroma*, which, like the glutton, distends itself to such an extent with its prey, as to be incapable of motion. It is a singular illustration of the law of balances, that while these very insects are imbued in bloodshed themselves, they are followed by flocks of birds which swallow up multitudes of the emigrating army in turn. Finally, the very striking fact may be mentioned, that Kirby, in a calculation of about eight thousand species of British insects, found that the two divisions, carnivorous and herbivorous insects, formed almost a counterpoise to each other, the former being a little in excess.

To turn to the kingdom of fishes. It has been calculated that one codfish produces about six millions of progeny in one spawning season. If from this vast number five millions five hundred thousand are deducted for losses by accident, or mischance, or prey, and only five hundred thousand remain as the offspring of one parent—were this small portion of the original sum alone to come to maturity every year, the sea would soon be swarming, other circumstances being favourable, with no other inhabitants. Not so: the check to this excessive productiveness is that of prey; and so efficient is its operation, that out of the original six millions, a few score, or even less, alone come ultimately to maturity. The herring is also possessed of astonishing fecundity, coming, as they do, to our shores and shoal waters in numbers which are feebly expressed by the term 'millions'—in shoals miles in length and breadth. What would ensue were there no means of keeping down this enormous production of living beings! By their consumption of the entire food of the ocean, all other fish, if they still remained inoffensive, would perish from starvation. Such a contingency is provided against by depredation. The sea-fowl in countless flocks feast upon them, and consume incredible numbers; the shark gulps down his thousands too; and the dog-fish, porpoise, grampus, in large herds, hem in the herring shoal, and at every instant are engaged in reducing its hosts; while man and starvation complete the havoc, and curtail the tendency to excess. To convey an estimate of the mighty numbers of these shoals, it has been said that if all the men in the world were to be loaded from some of them, they would not carry the thousandth part away! And if such is the productiveness of creatures inhabiting our northern seas, so strong the tendency to over-multiplication in the teeth of every obstacle, what estimate is to be formed of the fecundity of those more genial regions where all nature revels in luxuriance! The inexhaustible millions of fish which crowd the warm waters of the Indian Ocean are so vast, that fishing in those seas is next to a sinecure. But it is here that these voracious monsters, which are equally the terror of men and of the finny race, multiply to a corresponding degree, and keep down the exuberance.

Again, among birds. Rennie, quoting Reaumur, states that a single caterpillar of the *Gamma* (γ) moth lays four hundred eggs. If twenty of these were placed in a garden, and became moths, the eggs laid by these, if all fertile, would produce in the next generation eight hundred thousand caterpillars. Rennie adds, that did not Providence, therefore, put causes in operation to keep them in due bounds, the caterpillars of this moth alone, leaving out of consideration the two thousand other British species, would soon destroy more than half our vegetation. They are devoured in multitudes by birds. Bradley calculated that a pair of the common sparrows, with a young family at home, will destroy three thousand three hundred and sixty caterpillars in one week! Swallows, in their airy flights, destroy hosts innumerable of ephemeral and other insects. The shrike, kestrel, pie, rook, crow, woodpecker, and a vast number more, derive their entire subsistence from the consumption of insects and *annélides*, and the amount of service thus rendered

to man has received more than one ample corroboration. The hawk tribe, on the contrary, keeps down the production of field-mice, young rabbits, many of the smaller kinds of birds, and reptiles; and it is worthy of remark, that whenever, from unforeseen causes, any particular species comes to be in excess, these birds confine themselves to the work of keeping it down, from the simple reason that that is the most ready method of furnishing themselves with food. If the excess is at all permanent, it is productive of a greater increase in the numbers of the consumer, until a balance is at length attained. The influence of the more rapacious birds of prey in the same work, although advantageous, and, taken as a whole, of considerable momentum, yet fails to exhibit itself so strikingly in the individual as in the instances enumerated. A similar general remark is applicable to the operation of reptiles.

Lastly, to speak of mammals. The fertility of the rodent animals is so great, that were they at liberty to multiply unchecked, the period would not be far distant at which they would cover the earth with their progeny. Thus rabbits, which are said to have been originally natives of Spain, multiplied at one period in that country, and also in some of the islands of the Mediterranean, to such a prodigious extent, as to make it necessary to call in the assistance of the military to destroy them; but this failing to exercise any appreciable influence over the invaders, the ferret and weasel were introduced; and the numbers of the rabbits became very rapidly thinned down. Every one is familiar with the extraordinary fertility of our domestic nuisances, rats and mice: at an earlier period in the earth's history, they seem to have swarmed in still greater numbers. Dr Lund, in his essay on the Fauna of Brazil, states, that in a cavern which he entered in Brazil, and which is 120 feet long, from 6 to 9 feet wide, and from 30 to 40 feet high, about twenty feet from the entrance he met with a layer of brownish earth, very loose, and about a foot in thickness. On examination, this mould proved to be full of small bones. He filled a box, containing about half a cubic foot, with it, and counted in this quantity about two thousand separate *rami* of the under-jaw of a species of rat, besides the jaws of other animals. All the skulls were fractured: this was evidence of a violent death; and in the cave were found numbers of owls, which Dr Lund believes to have been, during successive ages, the murderers of the countless myriads of the rodent animals whose remains formed the floor of the cavern. Aristotle tells us that he put one mouse with young into a vessel of corn; in some time after he found a hundred and twenty descendants from this single mouse! In fact, were it not for furious civil wars, for the incessant hunting down of these creatures by cats, owls, snakes, and others, the rat tribe would almost dispute with man himself the dominion over the entire globe. The lemming or Lapland marmot, in armies made up of hundreds of thousands, at certain periods, generally once or twice in twenty-five years, sets out on its journey, and the host is followed by wolves, bears, and foxes, to whom the lemmings fall an incessant prey. Great troops of the *quaggas* or wild asses are occasionally known to migrate in search of food, and are cut down night after night by lions and others of the carnivora. The springbok or Cape antelope is also often driven down by drought from the deserts to the cultivated districts, where the havoc they commit is beyond estimation; and where they would soon be the means of depopulating whole regions, were it not that troops of ravenous animals follow, and constantly fall upon them. Mr Lyell quotes, upon the authority of Ulva and Buffon, an anecdote which appropriately illustrates the general system of counterchecks. The Spaniards had introduced goats into the island of Juan Fernandez, where they became so prolific, as to furnish the pirates who infested those seas with provisions. In order to cut off this resource, dogs were introduced; the goats were rapidly destroyed, and after this event the number of dogs as rapidly diminished.

Let us now turn, but briefly, to depredations which are committed more directly upon the vegetable world; by

means of which it not unfrequently happens that the whole vegetation of a district may entirely alter its character. The aphides, and the formidable locusts, come to take the foremost rank in this engagement. The aphides sometimes visit a region in such numbers that their armies darken the air, and alighting upon plants, they rob them of their sap, and not unfrequently strip them of their leaves, in either case effecting their destruction until another spring. The fearful ravages committed by locusts are so well known as not to require illustration. Their arrival destroys one balance, but institutes another in its room; the herbivorous animals speedily perish for lack of food, but the amount of animal matter and of life in the locusts more than compensates for this loss. This, however, is a defective balance. When not so universally destructive, locusts often restore the equilibrium in the vegetable kingdom; they attack a particular plant which may have been over-luxuriant, and consume it down to the ground, thus affording room and opportunities to other species to push forward. The Syrians and Hot-tentots turn the tables upon these creatures, and since they devour their produce, they become devoured themselves in its stead. Many caterpillars eat daily twice their weight of leaves; so that the harm a number of such creatures would do in a garden may be readily conceived. Just as with the locusts, so when the caterpillars, ants, and aphides multiply to excess, and thus rob the birds of their food, the latter find a very agreeable substitute in the persons of the devourers themselves.

There are a few special cases which have interest enough to entitle them to a short consideration. There are two modifications of the means of balancing in particular, which show, that to effect this great object, extremes can meet. The smaller predatory animals, after their wholesale destruction of life among creatures weaker than themselves, die at last the death of murderers, in becoming victims to the great generals in the art of slaughter—the larger carnivora. Again, the largest and fiercest creatures, in spite of their colossal powers, fall victims to the attack of the most insignificant beings. Illustrations of both of these propositions abound everywhere. In the first case, it is the savage law of superior strength and ferocity; in the second, it is the system of parasites, which is at once the instrument of retribution, and a co-operative means of preserving the equilibrium of species. Cuvier relates that the sword-fish, in spite of its terrific weapon, is overcome by the attacks of a little crustaceous animal which penetrates into its flesh, and renders it sometimes so furious, that it dashes itself on shore. De Geer says that even the sanguinary spider has a formidable enemy in a little parasite which attaches itself to its belly, and eventually succeeds in destroying the tiger of the insect tribe.

The balance is, however, held in equipoise by the assistance of other causes partaking of a more extrinsic character. The locusts, writes Barrow in his travels in Africa, are sometimes driven into the sea by a violent wind; on one occasion their dead bodies formed on the shores of Africa a bank three or four feet high, and fifty miles long. The sugar-cane ant, *Formica saccharivora*, at one time appeared in Grenada in such infinite numbers as to threaten the complete annihilation of the plant. Large rewards, to the amount of twenty thousand pounds, were in vain offered for some effectual remedy; and the universal ruin they caused was awful. In vain were fires lighted, or canals of water dug, to stop their progress, a forlorn-hope of millions would stifle the flame, or fill up the dikes, and over their dead bodies their comrades passed in triumph. Serious thoughts were at length entertained of quitting the island altogether, and abandoning it to its fate, until in 1780, a fearful tornado, accompanied with torrents of rain, entirely annihilated the marauders. The occurrence of floods over extensive tracts of country is another natural agent in restoring an overbalance to equilibrium. Humboldt in his personal narrative says, that during the periodical swellings of the vast rivers in South America, immense numbers of animals are drowned: the wild horses which graze in innumerable hosts in the savannahs, are annually drowned in

thousands by the sudden rising of the rivers which flow through them; the rising of the inundation being so rapid, that these creatures have not time to save themselves by retreating to the higher ground. Thus, if year by year these brute armies have their ranks increased by countless additions, inanimate nature itself arrays its powers against them, and seems to refuse to permit the excessive increase. The emigrating instinct may be cited as another provision for the same purpose. Large numbers of herrings are in their migrations frequently cast upon the shore, and stranded. Insects, such as the recent flights of butterflies, will, when they have multiplied to excess in one country, restore the balance there by taking their departure. Ants set out in great armies to found a new colony, and fall victims by the way to their many enemies. In Lapland, the squirrels, when pressed for food, will collect in large numbers, and set out on an emigrating expedition.

A beautiful thought suggested by Liebig opens up to our contemplation a view of balances in the vegetable kingdom, which I feel reluctant to leave unconsidered. From the vast amount of carboniferous remains discoverable in various regions, it has been conjectured that the primeval atmosphere was excessively charged with carbonic acid gas. A vast luxuriance of vegetation was the consequence, until by its means the surcharge of that gas was reduced; and then, by slow degrees, the excessive vegetation also became diminished, and the period arrived in which the quantity of the carbonic acid gas in the air neither increased nor diminished; in short, a balance was the result. If it increased, an increased vegetation would ensue, and bring the countercheck for the preponderance; if it diminished, there would be a scantier vegetation, until the amount resumed its standard again. In such a simple and wonderful manner are the atmosphere and the vegetable world counterbalanced. The geologist also, in reflecting upon the gigantic herbivorous animals which were in existence at a former epoch—the mastodon and megatherium—will not fail to connect with the former means of balancing the direct check which could result from the enormous appetites of creatures possessed of the most colossal proportions; creatures whom a forest would alone satisfy, and whose depredations no vegetation could have endured with impunity but the over-teeming one of a young world.

As some allusion has been made formerly to a kind of mutual influence discoverable in the relations of the different members of the vegetable kingdom, we will conclude by citing a few instances of the balancing of species in it. Decandolle writes—'All the plants of a given country are at war with one another. The first which establish themselves by chance in a particular spot tend, by the mere occupancy of space, to exclude other species; the greater choke the smaller; the longest livers replace those which last for a shorter period; the more prolific gradually make themselves masters of the ground which species multiplying more slowly would otherwise fill.' The naturalist thus comes to regard the weed in his garden as much the enemy of his delicate favourites as the lion is to the sheepfold; the only difference is, that it kills by suffocation, not by bloodshed. Thus the grasses and the hardy nettle will thrive in such rank luxuriance as to stifle the other species of plants; the restitution of the balance then devolves upon an insect or a quadruped which is attached to that kind of food, and then the others, to which they are indifferent, come to make headway again. Plants of one species also, when they multiply to excess, in a short time render the soil incapable of supporting them, and they perish, to give way to new species; and these, after a time, to others. In fact, rotation is a modification of the balancing principle.

Such is the simplest view of the subject: on the one hand a multiplying, on the other a subtracting power; both opposed to one another, and by their mutual opposition preserving the harmony of the creation scheme. Production and destruction, then, are the poles between which a kind of neutrality is observed in the operations of nature. But these poles are widely separated the one from the other, and thus a great range or play of forces may

be allowed in the working of this scheme, without in anywise involving the integrity of the great plan. The general balance which exists is a system, rather than a balance, of two constant equipoises against each other. Thus one entire species may be annihilated, and the check it exercised upon another race is then lost. This loss is commonly provided for; either another species takes its place in the work of deprecation, or the species upon which it fed is first dismissed, the necessity of a check is cancelled, and, as a simple result, the check itself passes away from the stage altogether. Here is an individual balance destroyed, but the law of balances is not thereby in the least affected. A simile may help to make this statement more readily seized upon. There are some species of foreign ants which are great wood eaters: these insects will frequently attack the posts which support a building; they consume the wood upon the solidity of which the superstructure is dependent; but for every particle of wood removed, they substitute a mortar of their own, which possesses equal or perhaps greater strength, and so in a little time the building which formerly rested upon wood is now, though still as secure as ever, resting upon a totally different support. Just so with the system of balancing. Its elements have been wonderfully different in past ages to those which obtain at present: the grand design has continued the same, although the basis upon which it reposes has been so entirely and so repeatedly metamorphosed.

THE MORAL ALCHEMY.

'In this the art of living lies.'

—DA COTTON.

A group of young people, composing the family of Mr Mansfield, were one winter's night collected in the drawing-room, around the centre table, gazing with eager curiosity upon an engraving which that gentleman had just unrolled before them. It represented an antique and spacious apartment, lighted by a single lamp, which seemed but to make 'darkness visible.' The occupant of this gloomy chamber was a spare old man, whose sunken eyes and wrinkled brow bespoke a life of mental labour. He was represented to be busily engaged with some occupation, the object of which fairly puzzled the younger children, and the heterogeneous articles which surrounded him did not tend to elucidate the mystery.

'This is an alchemist in his laboratory, making experiments in order to discover the Philosopher's Stone,' Horace Mansfield at length observed, addressing his brothers and sisters in a tone expressive of pride at his superior knowledge. 'What an absurd idea!' he added, looking somewhat contemptuously on the figure before him.

'In our enlightened days it does indeed appear so, Horace,' his father remarked; 'yet persons possessed of learning and ability engaged in the pursuit. It was the mania of the middle ages, and was not confined to men who might be supposed to have had leisure for the study, but was even pursued by princes. One of the German Electors* was surnamed *The Alchemist*, of which title he is said to have been more proud than of his electoral dignity.' Mr Mansfield then proceeded to explain to the younger children the motive which had induced the alchemist to spend his days and nights in deep study and repeated experiments, and lamented that so much valuable time should have been devoted to a fruitless pursuit, whilst that which was really useful, and would have tended to promote the interests of mankind in general, had been left unexplored.

'And yet, papa,' exclaimed a thoughtful boy, who had been looking very earnestly on the picture—'and yet if gold could have been made so easily, how much could have been done for the poor?'

'I question, my dear, whether benevolence ever investigated the pursuit,' Mr Mansfield returned. 'And had

the discovery been made, it is doubtful if the same value would have been set upon this now rare metal. Such things, my children, have no intrinsic worth. The value set on them is purely artificial, on account of their scarcity. Thus you see if what is termed baser metals could be transmuted into gold by a chemical process, that mineral would not be held in the same high esteem as at present.'

'Where do you mean to put this pretty picture, papa?' asked a little fair-haired girl, as she climbed to her accustomed seat on her father's knee.

'I intend, my dear, to have it hung up in the school-room,' was his reply.

'The school-room! I thought, papa, that you did not approve of pictures in the school-room?' chimed in another.

'I do not approve of such as would be likely to distract your attention from your studies; but when I have told you how, in my youth, I learned a lesson from a picture similar to the one before us, I hope you will always think of it when you see this.' The children looked up with pleased and eager glances.

'May I guess what it was, papa?' asked Horace with an air of self-importance.

'To be sure you may; but I doubt if you will succeed.'

'You wish the alchemist's incessant labour and contempt of difficulty to incite us to perseverance in our studies?'

'That would be an excellent moral to draw from the subject, Horace; but that was not the lesson I learned from it.'

'Well, then, papa, we must leave it to you to tell us what it was.'

'When I was a youth of about your age, Horace,' Mr Mansfield began, 'I had conceived a great desire to follow one of the learned professions; not that I had any particular talent for any, but I had adopted the erroneous idea that it would increase my importance. My father had, I knew, other views for me. I was his only son, and being engaged in a flourishing line of commerce, he naturally wished me to be associated with him, more especially as he was in delicate health, and had a large family of daughters to educate and provide for. I never thought of disputing my father's authority; yet my obedience was of a description which I now think of with shame, for it was anything but prompt and cheerful. I consequently commenced my new duties with a spirit altogether at variance with their proper fulfilment. As might be expected, I was always unhappy. I considered myself an injured individual, and deemed that my prospects in life were entirely blighted. Whilst my mind was in this desponding and discontented state, a relative of my mother's paid us a visit. He was one of the most delightful specimens of cheerful old age I ever met with. He had spent a life of activity and usefulness, and was ever ready to sympathise with and encourage the young in a similar course. He very soon discovered my source of regret; but he did not make any remark until a circumstance occurred which gave him an opportunity of teaching me a lesson.

'I accompanied him on a visit to an exhibition of pictures, where, amongst other gems of art, was an exquisite painting, the subject of which was similar to the engraving we have before us. I was much struck with it, and stood for some considerable time rivetted to the spot; then turning away with a bitter smile, "Ah, would," I murmured, "that I had been the fortunate discoverer of that stone!" This brief exclamation was not intended to meet the ear of my aged companion: but it did so; and he eagerly inquired whether I desired the *same* of the discovery, or the unbounded *wealth* it would produce. "The wealth, sir!" I energetically replied; "but not for its own sake, for I am not avaricious;" and, encouraged by his manner, I then proceeded to open my heart to him, by making him acquainted with my severe disappointment. Nothing further passed on

* John Margrave of Brandenburg.

the subject until we were on our way home, when, with a good-humoured smile, the old gentleman addressed me. "I have, my dear young friend," he said, "been turning your wish over in my mind; and thinking it unlikely that it will ever be realised, I have hit upon an excellent substitute." I looked up not a little puzzled to divine his meaning, but made no remark. "The Philosopher's Stone," he resumed, "is, I believe, now generally admitted to have been a mere chimera of the imagination; but it is in your power to effect a transmutation of infinitely more value, and this is no secret science. The experiment may be tried by any one." "I really do not understand you, dear sir," I returned with some anxiety, supposing that he was about to make a revelation which would further the objects of my desire. "Providence has not permitted you to follow the bent of your own inclination," he resumed. "You are dissatisfied, and consequently unhappy: thinking, like the prophet Jonah with his gourd, that you 'do well to be angry.' Now, if, instead of brooding over what you deem to be your misfortunes, you were to try, by the magic power of a moral alchemy, to transmute your duties into pleasures, you would, I think, find the result successful. You look surprised and incredulous, my young friend," he pursued; "but I can assure you that the thing is practicable, because I have made the experiment myself. When the occupation is simply manual, we may employ our thoughts upon more agreeable and congenial subjects; but when they are necessarily chained down to an uninteresting employment, the very fact of its being a duty, if it be discharged with a cheerful spirit, may invest it with a charm. Will you try this moral power?" he asked, affectionately taking my hand. "I will—I will indeed, sir!" I exclaimed. "You have made me thoroughly ashamed of my discontented spirit." And I did try it, my children; and having experienced its happy effects, recommend you all to make the same experiment for yourselves.

NOTES ON LONDON.

BY AN OUTSIDE BARBARIAN.

It is perhaps my *outsidism*, but I hope it is something better, which causes me to be surprised at certain circumstances attending the management of the theatres in London. Having many friends connected with the newspaper press, I am, immediately on stepping in from the country amongst them, beset with offers of tickets for the theatres, which, they tell me, cost them nothing. They offer this favour in a pleasant humour, as if glad they can be of any such service to me. As intended for a piece of kindness, I dislike refusing the offer; yet neither do I feel comfortable in accepting it—and, practically, I make a point of never using any tickets so obtained. For why, it occurs to me forcibly, should I 'sorn' upon these poor actors for my amusement? Why, if I wish to partake of the enjoyments they profess to furnish to the public, should I not pay for them, as I pay for my lodgings, my cab, my meat and drink—above all, for my newspaper? 'It is a custom of the managers towards the press,' such is the defence put in; 'and you do not injure any one by taking advantage of it.' Oh, but such a custom! The journalist professes to 'extenuate naught, nor set down aught in malice,' against the theatres; his primary duty towards the public demands that he should be perfectly just and impartial with respect to these places of amusement. Well, such being his relation to them, what business has he with their managers but to obtain, at the most, that gratuitous admission for himself which may be necessary in order that he may have no impediment to the preparation of his criticisms? Any-

thing beyond this, what is it but a bribe, either exacted from the fears of the managers, or offered under fear? Is it not simply because the press is understood to have a power of damaging by its reports, that it obtains this concession? Can any one for a moment imagine that a manager would give journalists gratuitous tickets for their friends, if it were not in the hope of thereby softening the rigours of their critical sense, or at the least preventing them from condemning in mere whim, which is known to be in their power? Talk of Turkey or Persia, where industry bribes power for leave to toil, and leave such a base little tyranny as this unredressed, unspoken of! Talk of the honour and purity of the English press, when it fosters in its bosom a corruption as bad as that of Bacon—only more disgraceful, in as far as its victims are, by universal confession, a class unusually subject to penury, and all the saddest difficulties and distresses which harass human existence! Oh shame, shame!

When the outside barbarian, however, goes to the theatre, and honestly pays his own money for the value proposed to be received, he finds another piece of absurd arrangement of a different kind. He can hardly get a door civilly opened to him for the admission of himself and his wife to their box, without administering a bribe to the servant in waiting. Outsiders who do not pay will doubtless be let in, but with the consciousness that they are regarded as shabby, and they will be told to sit on some of the back seats, as the front ones are engaged. By and by come perhaps some more knowing persons, who pay a shilling to the box-opener, and immediately these persons are proclaimed as the party for the front seat, although there was no engagement in the case. All this is detestable; and, judging from our own feelings, we cannot doubt that it is unfavourable to the interests of theatres, seeing that it makes playgoing uncomfortable.

Suppose that managers were to discontinue bribe-tickets to the gentlemen of the press, and apply the saving to the proper payment of their servants, so as to insure unsuborned civility and good treatment for those who are their real supporters?

LONDON AN ANTIQUATED TOWN.

From the universal neglect of street improvement till a late period, every town is less or more antiquated, and far from comfortable or salubrious. London, the centre of wealth and influence, might have been expected to be more improved than places of less importance; but this is far from being the case. Physically and morally, the metropolis seems to be pretty nearly impervious to change; the people, I fancy, being all too busy about private, to think of public affairs. Be this as it may, the structural and other arrangements of London, with some few exceptions, are not creditable. The want of sufficient thoroughfares, lengthwise, crosswise, and diagonally, is perhaps the most striking deficiency. Notwithstanding some minor alterations for the better, it is to this day impossible, without great inconvenience, and the encountering of many unpleasant scenes, to make one's way diagonally through London—neither from Charing Cross, for example, to Islington, nor from Temple Bar to the Regent Circus. We must, for such a movement, go by some right-angled course. It is equally impossible to proceed in a carriage to any distant place with the certainty of reaching it in a given time. You may be blocked up in Fleet Street or the Poultry for half an hour, or in some other way so far impeded, that trains may have started, and steamers set sail, and you be 'left lamenting.' As a last monster evil, the cattle-market is held in the centre of the city—a source of inconvenience and even danger beyond all endurance. The press, I am glad to see, frequently alludes to these scandalous imperfections in management; and I wish it would go one step farther, and ridicule the folly of state functionaries, on the occasion of public feasts, flattering civic dignitaries, as if they deserved commendation for their indolence and conser-

vation of all that is mean, disgusting, and dangerous. How much more becoming would it be for ministers of the crown to insist on the execution of public improvements in London; and, in particular, that that abomination, Smithfield market, should be swept away!

London is also antiquated with respect to cleaning. I lately passed through streets within a hundred yards of Oxford Street—broad, good-looking streets too—which were in a wretchedly neglected state, with lines of putrid pools on both sides. The narrower, meaner streets are also offensive, especially in dry weather—for Jove is evidently much looked to for aid by those in charge of this department. In Deptford, close behind lines of houses, there are stagnant lakes of nastiness fit to breed a pestilence in suitable conditions of the atmosphere. These are distressing things to be connected with the nineteenth century, and flx down London, beyond all appeal, as an antiquated town.*

It is curious to observe the numberless minor traits of antiquatedness which beset London usages. At one place we see the neatness, precision, and rational civility of a railway station: at another we are stopped five minutes at the end of a lane in the Strand, till a huge clumsy wagon, with four horses—a thing entirely in the fashion of a bygone age—winds its slow way into the thoroughfare, where it is a cumber and an annoyance to any other kind of vehicle; or we have to purchase immunity from the insolence of a cab-driver, by submitting to overcharges for which there is no available remedy. Many things are accordant with modern ideas of convenience, so that it is a pleasure to have to do with them; many others are rude, vexatious, and uneconomical. Perhaps it is not too much to say that every age, from the Romans downwards, is represented in the modes and usages, as well as the domestic accommodations, and the police practices, of London.

STAMMERING.

I have been taken by a friend to see stammering cured by Mr Hunt in Regent Street. Though a matter in which a patrimonial interest is concerned, I feel tempted, by the interesting nature of what I saw, to make public allusion to Mr Hunt's system. Two young men were in attendance, both grievously afflicted with stammering, and both new cases. One was asked to sit down, and Mr Hunt then addressed a few questions to him, on which he made the usual wretched attempts to answer. This young man had no recollection of ever speaking fluently. His attempts to read were equally miserable failures. Mr Hunt then explained to him, in simple terms, the physiological and moral causes of stammering, and gave him a few very intelligible directions for the regulation of the mouth, tongue, respiration, and the part of the chest to speak from. The youth was soon able to pronounce sentences, and also to read, with considerable readiness. The other youth was then put through a similar series of lessons, and in an equally short time the comparatively perfect use of the organs was attained in his case. On a subsequent visit, I saw a girl who stammered and hesitated in an extraordinary manner, restored to a common style of speech in less than twenty minutes. These, however, are not cures. A complete victory over the bad habit can only be the work of time.

* On a former occasion, in noticing deficiencies of this nature, we were so unfortunate as to displease various parties, who, by way of reprisal, told us that Edinburgh was a vastly more dirty town than London. Agreed: in some respects Edinburgh is dirtier. But they make a great mistake who suppose that we care about any one town more than another. On this, and everything else, we are quite cosmopolitan. We ask, as any person might surely ask, and, in fact, as the London press is constantly asking, why the streets of the metropolis are not swept daily on a uniform plan? Because the town is under the thralldom of antiquated civic and parish institutions; the reform of which, in order to produce a systematic and harmonious whole, suitable to the wants and feelings of the age, the people will not give themselves the trouble to insist upon; and, as is well known, few things are set to rights in this country without an uncontrollable clamour.

There is no mystery whatever in the plan. It is merely replacing nature upon her pivot, from which accident or bad habit had thrown her. What the instructor does, is but a small part of the cure. The greater part is the work of the pupil, fully obeying the rules, and persevering in them, till a new habit has been acquired. Most persons, I conceive, would not be safe from a relapse under carelessness for many months, and individuals of weak will might fail altogether.

Mr Hunt is, strange to say, a Dorsetshire yeoman, who has been led by accidental circumstances to add this to his other avocations. He laments being under the necessity of keeping his plan in the meantime a secret—the only thing about it which struck me disagreeably; for who would not wish to see the means of abolishing stammering diffused as widely as stammering itself? The exhibition is a most interesting one, creating that peculiar satisfactory feeling which we experience when the triumph of nature over error is asserted. Yet, as if to make good the rule that all benefits to humanity must come through the sufferings of individuals, Mr Hunt has been subjected to persecution on account of his practice. It was discovered that stammering ought to be regarded as a disease, and therefore treated only by qualified medical men: on this ground Mr Hunt was publicly denounced as a quack. It would be as reasonable to demand that a dancing-master, who substitutes graceful for awkward walking, or an elocutionist, who extirpates patois from the tones of the voice, should have a medical diploma. A beautiful thing it would be, indeed, for the resolver of this difficulty to go to a faculty altogether ignorant of the subject, and study their mysteries, which have nothing to do with it, and nine-tenths of which are now under a strong suspicion of being mere delusion, before he could be allowed to make use of an invention of his own, the benefits of which are palpable!

A TALE OF MODERN ITALY.

In a certain province of Northern Italy, subject to the Austrian government, some years ago there dwelt a widow lady of noble family, Ginevra Marchetti by name. Her husband had been killed shortly after their marriage in a duel with a German officer, with whom he quarrelled on the subject of the Austrian domination. He left to the disconsolate Ginevra his estate, his castle, and one only son, then an infant. The estate was well cultivated, and yielded a large income. The castle was beautifully situated in a mulberry grove, by a rushing stream, and formed a delightful residence. But in the little wailing new-born babe the solitary widow alone found the courage to live and be resigned. No; resigned she was not: it is by no means an Italian virtue, and Ginevra partook largely of the most striking features of the national character: hot-tempered and enthusiastic, fierce in her resentments, passionate in her attachments, and carrying to extremes even those natural affections which, uncontrolled, will as surely produce our utter wretchedness as they are intended to form our greatest happiness. She had shared in her husband's overweening detestation of the Austrians, and it may easily be imagined how much that hatred was augmented by his death; and the more utterly her country became subdued, the more wildly seemed to burn her patriotic ardour. All these feelings, however, became lost and deadened in the one all-absorbing tenderness which was her life—an only son, an only child! It will readily be supposed with what ungovernable love such a person must have doted on such a treasure. But from that first moment when she had lifted herself from off the cold body of her husband, to snatch the living babe to her breast, one terrible dread (in her superstitious ideas a presentiment) obtained complete possession of her mind—the dread that the poor infant would one day share the fate of the bleeding corpse before her, and die for his ungrateful country. To guard against this, and cheat the fates if she could, she

determined that the child should never know what death his father had died; and never, if she could help it, leave his quiet castle and the boundaries of his own property, where no rumour might reach him of the great oppression of his native land.

For a long time her plan seemed very successful. Lorenzo passed from being a comical little baby, with long black hair, to roaming through the gardens a beautiful dark-eyed boy; finally, he became a fine-looking, high-spirited young man, the very idol and pride of his mother's heart. All Italians seem to be by nature instinctive worshippers of the fine arts; they must infallibly be either painter, poet, or musician, and generally all three. Lorenzo had from infancy shown a great predilection for the study of painting, and as he grew older, he displayed very considerable talent. He could think of nothing else; it was his sole occupation; and he spent days, and even nights, in his studio. Ginevra was delighted: she saw how completely he was absorbed in his favourite art, and she hoped it was to prevent him from wishing to see more of the world, or taking any interest in the political events of the day. For some time Lorenzo was quite content to work out his wild fancies as best he might, or to make one portrait after another of the peasant maidens, with the purple grapes and vine leaves twined in their dark-brown hair. But true genius is always aware of its own deficiency. He had a lofty ambition—the best ladder to success; and one day, in a fit of despair at his own performances, he flung his last picture out of the window, and declared to his terrified mother that he would start next day for Bologna, in order to study at the conservatory there. Her wild distress may well be supposed. Bologna! the very hotbed of political intrigue, the very centre of Carbonarism and secret societies! She declared he should leave the house only over her prostrate body, and was so frantically vehement in her opposition, that at last her son, though scarcely less passionate and fiery than herself, appeared to acquiesce in her wishes, and no more was said on the subject. One morning, when, as usual, she flew to his studio as soon as she arose, to gladden her eyes with the sight of her darling child, to her unutterable horror she found only a portrait of himself, of a striking resemblance, which he had secretly painted for her, and now left with a short letter, stating that, unable to control any longer his artistic enthusiasm, he had departed to study at Bologna, or elsewhere, as he might find most suitable. The picture would console her so far, he hoped; for as surely as the eyes would always look steadily on her, so truly should his thoughts be with her ever. He concluded by promising to write, and ultimately to return, but gave no indication as to the exact route he had taken. To follow him was therefore impossible, and Ginevra had nothing for it but to fill the air with her shrieks for a time, and finally to settle down into a mournful despondency, during which she sat, hour after hour, gazing at the portrait, and trying to believe what it had been promised the eyes should tell her.

Lorenzo did not fail to write, and his letters became indeed the only joy of his mother's existence, but he always contrived cunningly to leave her in uncertainty as to his exact abode. Now he was at Bologna; now at Rome; now travelling about the country in company with other artists, in search of studies from nature. Sometimes long intervals would elapse between his letters; then Ginevra robed herself in mourning from head to foot, and refused to open her lips, till the arrival of a letter seemed to restore her to life. At last came a longer period than had ever yet passed without her hearing from him. Her anxiety finally overcame the sullen gloom in which she generally passed those dreary intervals, and she took every possible means of obtaining information respecting him, or even regarding the state of those towns in some one of which she imagined him to be. It became her custom during this period of terror and misery to walk down every evening to the

village inn, where she occasionally heard from the passing travellers such reports on the state of the country as greatly interested her; and when the stranger was above the rank of a mere peasant or country merchant, she generally invited him to pass a few hours at the castle with her, in order to gain what information she could.

Months, many wretched, terrible months, had passed away, and no tidings of her beloved son had reached her. Ginevra was wasted to a shadow; she neither ate nor slept, but sat continually like a monument of living despair before the treacherous picture, that still smiled upon her sweetly as ever. One day there chanced to pass through the village a man of some rank and influence, likely to be well acquainted with all that was going on in the world without; and compassionating the overpowering anxiety of the unhappy mother, he agreed to spend the day with her, in order to give her his advice as to the measures she ought to take for the recovery of her son. They had been some time in conversation, talking as yet chiefly on the unsettled state of the country, when Ginevra having offered her guest some refreshment, conducted him through a long suite of rooms to that in which the meal was laid. She of course walked first, and suddenly was startled by an exclamation which burst from the lips of the stranger. She turned round in haste, and saw that he stood motionless before the picture of her son, which hung in the little boudoir through which they were passing; and a single glance showed her that his was a gaze not only of recognition, but almost of horror. She flew back to him; she grasped him by the arm; for a moment her utterance seemed choked; then she poured forth a torrent of questions. It was her son! Did he know him? Where had he seen him, and when? He did not know him, the stranger answered, but *he knew the face*; and he uttered the last words as though they contained some terrible secret, for his voice faltered, and he turned away from the eager, eloquent eyes of the poor mother. Ginevra could not understand this. However, hope, well-nigh extinct, had been suddenly re-kindled in her bosom, and she pressed him instantly to tell her all—all he knew of her long-lost treasure! He had seen his face?—then he had met him accidentally?—at Bologna, in the picture-galleries doubtless?—at Rome perhaps?

In vain, for some time, the stranger endeavoured to elude the questions of Ginevra, and then sought at least to break the truth to her with some degree of caution. Her vehemence, her wild supplications, overcame him at last, and she worked herself into such a state of frenzy at the momentary suspense, that he finally disclosed to her all he knew without reserve. At the close of his recital, she lay at his feet rolled into a heap, in violent convulsions. The circumstances which he stated were briefly as follows:—

The stranger, who gave his name as the Marchese B——, had been residing for several months past in a small German town in the Austrian states. It had so chanced that his house was directly opposite to the prison—an enormous building, whose inhabitants formed, strictly speaking, the largest part of the population. Narrow as was the street which divided it from his dwelling, he remained in profound ignorance of all that passed within its massive walls, and might have fancied it as tenantless, as in reality it was full of suffering beings, but for one slight circumstance, which soon became for him a source of intense and painful interest. One of the small closely-barred windows of the prison was directly facing those of his apartments. It remained always completely closed, with a great iron shutter, which must have excluded both light and air, and which was never opened excepting for two or three minutes every morning, when it was partly pushed back, probably by the jailor, in order that he might examine the cell—and at that moment, daily, there presented itself, behind the thick bars, a young sad face, that for a brief instant looked wistfully out upon the

blue sky and far green hills, and then vanished as the iron plate rattled back to its place! Daily the Marchese had acquired the habit of stationing himself at the window, to watch for this mournful apparition, and trace in the wasted features the terrible effects of the discipline of solitary confinement. When he first saw the face—and it is needless to say he had at once recognised it in the picture of Ginevra's son—it was blooming and bright as the beautiful image before him; but day by day he had seen it fade away, grow paler and older by the many long years into which despair had transformed the lonely hours of his prison-life; soon the eyes looked out without a gleam of hope, the lips did not even part to breathe their wonted sigh; and the good Marchese dared not say how wan, how dim, how almost ghostlike it had seemed to him when he last looked on it.

Ginevra lay in convulsions on the ground, as we have said. But however ill-regulated the mind, or fierce the passions, there is a courage, a constancy, a power of endurance in a mother's love, which never fails in the darkest hour; and after a time, she rose, composed her distorted features, gathered up her long dishevelled hair, and sat down deathlike, but resolute, to consult what was best to be done. Lorenzo lived! that was something: and she was fortunate in the strange coincidence which had converted the Marchese into her warmest friend; for, deeply interested in both mother and son, he determined to leave nothing undone to restore them to each other. After much consultation, he finally prevailed on Ginevra to remain passive where she was, whilst he himself undertook the incalculably difficult task of attempting to effect the liberation of her son. Fortunately, the Marchese B—— was a man of considerable influence with the higher authorities; but still the obstacles he had to overcome seemed almost insurmountable. In the first place, it was no easy matter to identify a prisoner amongst the mass of unknown individuals whose very names became obliterated instantly on their separation from the living world. Most happily, in his profound interest for the poor captive, whose melancholy face haunted him, he had asked who he was—a fruitless question indeed!—and received for answer that he was No. 10. Still, even this was a clue, if by this time poor Lorenzo had not become the No. 4 or No. 5 of some other prison. Not to dwell too long on the details of his search, we may pass on to state that he did at length succeed not only in discovering him, but in obtaining a commutation of his sentence of perpetual imprisonment to that of perpetual exile, with confiscation of his property.

As to the crime of which all this was the punishment, a few words of bravado, rashly spoken in an open coffee-house, seemed to have been the 'head and front of his offending.' It need not be said that Ginevra determined at once to follow her son in his expatriation, though to her it was no slight matter thus to abandon her country for ever, as Lorenzo was sentenced, on pain of death, never again to set foot on the Italian shore. The benevolent Marchese assisted her in making her arrangements, as she was obliged almost instantly to quit the castle, no longer hers; and with the money procured by the sale of her jewels, this daughter of a noble house travelled to Trieste, where Lorenzo was to be conveyed, still a prisoner, and destined to receive his freedom only after his embarkation at a certain distance from his native shores. Their first meeting took place, therefore, on board ship; for as long as the young man was a prisoner of Austria, he belonged to a class who apparently are not supposed to have any earthly ties or human affections at all! And what a meeting for the mother and son! The fair, undulating hills of their own dear country fast receding from their view, to be beheld no more; themselves, beggared and abjectless, sailing away they scarce knew whither; and if Lorenzo looked with astonishment on his mother's hair, which he last had seen a raven-black, now white as snow, she on her side, but for the unfailing instinct of the parent's

heart, might have doubted if this worn, spiritless, enervated man were indeed her bold, energetic, vigorous son.

After wandering for some time without aim or object, and well-nigh exhausting their slender means, which were still drawn from the sale of the last remnants of their former opulence and luxury, Ginevra and her son finally settled in one of the Ionian islands, chosen principally because there they would at least hear the sound of their native language. It was a bright green island, which many a one might covet longingly as a fair and quiet resting-place. But to the poverty-stricken son and mother it was not Italy; and we are well convinced that nowhere is the pure unmixed love of country to be found so strongly implanted as in the breast of an Italian. With them it is a deeply-rooted principle—a very instinct as it were; and we do really believe that the pangs of an exile, banished from that garden of Europe, are unspeakably severe, notwithstanding the absurdities in which poets, ancient and modern, have indulged on the subject. It was a bright green island, but Ginevra was far from her husband's grave, and Lorenzo from the living friends of his youth. Soon other cares began to weigh them down each day more heavily: want stared them in the face—actual want—and they had till now only known the utmost refinement of luxury. Their resources were quite exhausted, and their last and only means of support became the pencil of Lorenzo; but with what feelings did the young painter, broken-spirited and sickly, resume his once beloved art!

It is an old time-worn reflection, that nothing is so utterly destructive to genius as the necessity of drawing from it the means of daily subsistence; what was once the very paradise of fancy, becomes an insupportable drudgery: and it proved so with Lorenzo: instead of indulging in the wild flights of unfettered composition, he was now forced to paint staring portraits of clumsy shopkeepers, or ambitious milliners, who paid him ill, and drove him half-frantic by their ridiculous criticisms on his performance. This means of living was, besides, very precarious—often it failed him altogether: his natural delicacy and gentlemanlike feeling, which he could not get rid of, were greatly against him. At last another less scrupulous portrait-painter established himself in the town, and Lorenzo was deserted at once and entirely: in a few weeks more they were starving! Happily, most happily—and Lorenzo thanked Heaven for it—at this juncture the worn-out, broken-hearted Ginevra died, making her last moan that she would not rest by her husband's side, in her own native home. She died of intermittent fever, the disease of the country, which, though not usually dangerous, had proved so to her enfeebled frame. Lorenzo was attacked with it at the same time; but in youth, life has a wonderful tenacity, and he recovered, to find himself in a state actually of squalid wretchedness. His mother was dead, and he was reckless and broken-hearted. Life was utterly without hope or interest; he never dreamt of finding such in that which is beyond it, and soon he became altogether careless as to whether he lived or died. But in the midst of his misery, and at last of his starvation, one fierce and burning desire—maniacal we must call it—rose up within him, with an intensity which would not be subdued. It was the frantic longing to look once more upon his native land; once again to set his feet upon his native shore; he cared not how poor, how wretched, if but there! And besides, in Italy he had friends, if he could succeed in entering it unknown: in some one of its wild deserted valleys he surely might find a safe refuge. He was greatly changed; several years had elapsed since he left it; he might safely believe himself forgotten. But even were he not, who would recognise in the haggard, abject-looking creature, the once gay and proud young noble?

To attempt procuring a passport, without which he could neither leave the island nor land in Italy, was, he well knew, an utter impossibility. He did not even make the endeavour; but he managed, in some extraordinary

manner, to secrete himself on board of one of the steam-packets which ply between the Ionian islands and Trieste, and remained hidden till they had been two days at sea. Then forced by hunger to appear on deck, he succeeded in telling the story of his sufferings in so touching and eloquent a manner, backed as he was by his wretched appearance, that he won the compassion of all on board, and obtained the captain himself as his zealous protector. This man promised to do all he could to assist him in landing unmolested, but he greatly doubted the possibility of success. The absence of the passport would infallibly produce inquiry; and notwithstanding the exile's assumed name and change of appearance, he knew the management of the Austrian police too well not to dread the result. But poor Lorenzo was sanguine. Sorrow and anxiety had half-maddened him, and his monomania had become the desire, or rather the wild determination, to visit once more his beloved Italy! He refused to believe it possible his hope could fail. At length the steamer reached Trieste; and how did the heart of the returning exile bound within him as he beheld that gay city rising out of the blue sea before him, with its stately buildings and its vine-clad hills!

As usual, the customhouse and quarantine officers instantly came on board to examine the passengers. When the passports were demanded, Lorenzo's deficiency was at once discovered; but the captain endeavoured to fabricate a story, explaining the loss of that important paper, and did what he could to remove all suspicions. His eloquence was not without its effect; but still they could not allow the exile to land till they had communicated with the authorities; and as the steamer was to remain in port for a day or two, they agreed to leave him on board under the surveillance of two gendarmes, until they received their orders respecting him. Poor Lorenzo was now forced to watch the passengers landing one by one on the shore, that, like the mirage of the desert, seemed to mock him with its brightness; but the more he feasted his eyes on the fair landscape, the more convinced he seemed to be that he should yet roam amongst its valleys. Several days passed, and the shrewd captain augured ill of the delay. He felt that they must have fallen upon some indication which had awakened their suspicions, and led them to make a lengthened inquiry. He knew that there existed certain volumes—a library in themselves—the annals of the secret police, where the private history of half the population of Austria was noted down, and all characterised by various comprehensive epithets. He greatly feared that his poor friend must figure there in no very complimentary terms; and he was right. The sharp agents of the police had soon traced out the unfortunate exile, notwithstanding his change of name; and on referring back through the countless pages of these terrible books, the name of Lorenzo Marchetti was found with the fatal word 'Proscritto!' This was enough.

On a bright sunny morning, Lorenzo, ever on the watch, perceived a boat putting off from the shore filled with officers in the Austrian uniform. As he saw them direct their course towards the vessel, he became half-frantic with delight and impatience, never doubting but that they were coming to release him. The good captain drew near, shaking his head dubiously; and in another moment the boat was alongside, and the officers had mounted on the deck. They walked straight up to the trembling exile. 'Lorenzo Marchetti, let us go!' they said.

At the sound of his own name, the unhappy man grew deadly pale. 'Where would you take me?' he said with quivering lips.

'To the prison of Spielberg!' was the answer.

'Ah e troppo!' ('It is too much!') he exclaimed; and Lorenzo with a bound threw himself on one of the officers who stood near. The German defended himself, thinking he wished to attack him, whereas his sole object was to possess himself of the short sword he

wore by his side. In this wild effort he succeeded, and exclaiming, 'At least they shall bury me in Italy!' Lorenzo plunged the instrument into his heart, fell back into the arms of his horror-stricken enemies, and expired without a groan!

PROGRESS OF NATIONAL INDUSTRY.

MR PORTER'S 'Progress of the Nation,' noticed in a recent number, has already been followed by a new edition of Mr McCulloch's 'Descriptive and Statistical Account of the British Empire,'* from which we shall now proceed to collect such information as may throw additional light upon the general subject.

The section relating to the industry of the United Kingdom commences with agriculture, as 'the first and most important of the useful arts.' The total number of landed proprietors in England alone is estimated at 200,000, and the average annual income of each at £200 a-year. But although this is the average, the value of their properties ranges from forty shillings to £100,000 a-year and upwards. Taking them generally, the landlords are hard-working men, of very moderate income; although it is the custom to regard as their type the few owners of large estates, whose wealth and importance attract the greatest share of public attention. The small farm system is stated to be injurious to the progress of agriculture, and to the habits of industry of the farmers; while moderately large farms produce more (in consequence of increased outlay) in a given space, and act more favourably upon the character of the population. The local population, it is true, is less; but owing to the exchange of the produce for the various objects of art or industry, the mouths fed are more numerous. In England the estates generally are of a moderate size, while in Ireland they are larger. But in the latter country these large estates are split into such minute holdings, that four-fifths of the people are supposed to subsist on the produce of the land they occupy. The consequence of this is almost universal poverty and misery. The small farmers have not sufficient occupation for their time, and grow up in incorrigible indolence; and being prevented, by want of means, from adopting improvements, agriculture languishes, and the most fertile soil in the world produces only *one-fifth part* of what it might do under a better system.

Various causes are assigned for this state of things in Ireland; but one of these has existence likewise in England, although modified there by other circumstances. This is the law as regards leases, which in these two countries are regarded as movable property; whereas in Scotland they are an inalienable estate, descending (except in cases of special provision to the contrary) to the heir-at-law. The result of this is, that in Scotland the younger sons look to other professions than agriculture for support, or move to other localities or countries in search of employment, leaving the inheritor of the land to devote his unclogged energies to the increase of his farm, and the advancement of its agriculture. This, however, is only part of the truth. The substantial reason for the superiority of Scotch husbandry is, that in Scotland every farmer has a lease of some kind, generally for nineteen years, while the bulk of the English farmers have no lease at all. Tenants-at-will from year to year, they have no encouragement to improve the land, and are for the most part practically serfs of the landed gentry, who look more to political considerations than rent. The backwardness of English agriculture from this and other causes is a curious feature of a country renowned for its manufacturing and commercial energy.

A full half or more of the arable land of England is applied to grazing husbandry, while in Scotland and Ireland the great proportion is under crop. The number of horses in Great Britain is about a million and a-half,

* Longman and Co.

estimated to be worth from eighteen to twenty-two and a-half millions sterling. The total head of cattle is estimated at 5,620,000, of which a fourth part, or 1,405,000 are annually slaughtered for the supply of the kingdom. The weight of the cattle and sheep killed in London has more than doubled since 1710: the animals weighing at present, on an average, 800 lbs. bullocks, 140 lbs. calves, 80 lbs. sheep, and 50 lbs. lambs. In Ireland, in 1841, the number of horned cattle was 1,863,116, most of which are sent to this country.

The milk sold in London alone amounts in value to L800,000 a-year, and butter to L1,120,000, the latter being the produce of 150,000 cows.

The number of sheep in England and Wales is 26,148,463; in Scotland, 3,500,000; and in Ireland, 2,106,189—producing in all 540,000 packs of wool.

The present value of timber in England is estimated at from forty to fifty millions sterling, and its yearly product at from one and a-half to two millions. The royal forests, enclosed and bearing oak for the supply of the navy, cover from 50,000 to 60,000 acres. In Scotland the total extent of woodland considerably exceeds a million acres; and in Ireland it is only a third of that area.

The total annual value of the agricultural produce of England and Wales is L141,606,857; of Scotland, L27,744,286; and of Ireland, L48,200,834. The profits of farmers are stated at one-half the rent in England, and one-third in Scotland, which would give 9½ per cent. on the capital employed. This includes, however, all they receive themselves as wages, and proves the business to be anything but a lucrative one. Yet low rents are supposed to be as injurious to all parties as high rents; in proof of which, the following anecdote is told relative to South Wales:—'A gentleman noted for his liberality to his tenants, during the last seventeen years of his life laid out upwards of L20,000 in improving the farms of his tenants-at-will, without charging them a penny in advance of rent. He died; and his successor, of a different cast, leaving off improvements, tried what doubling the rents would do; and it is painful to relate, for it borders on a libel on human nature, that this advance of rent, considered exceedingly grievous at the time it was imposed, had a greater effect in improving the agriculture of the estate than all the benevolence and forbearance of his predecessor. The tenants were now compelled to do for themselves what another did for them before.' A rise of rent is, generally speaking, a sign of improvement; and to such an unexampled extent did this take place in Scotland, that the entire rental of the kingdom rose from one million in 1770, to four millions and a-half in 1815.

The improvement of agriculture was slow, and frequently interrupted; but the general result is so satisfactory, that it is affirmed that Great Britain provides food at present sufficient for the comfortable sustenance of five millions of inhabitants more than in 1820. Nor are the capacities of improvement exhausted. On the contrary, there is almost a boundless vista of prosperity before us. 'It is impossible, indeed, to say to what extent, under such circumstances, improvement may be carried.'

Such are the treasures that grow, or move, upon the surface of the country: beneath, in its depths, though we find little either of gold or silver, there is an almost inexhaustible abundance of substances that are of much more importance to mankind. The first of our minerals may be said to be coal, since upon it depends mainly the production of the rest. In some parts of the country, for instance, there is iron, but for want of coal it is not worked; and such districts are set down as destitute of mineral wealth. Coal is the grand *primum mobile* in this manufacturing country. To it Glasgow, Manchester, Birmingham, Leeds, Sheffield, owe their greatness; and to the want of it many of the great cities and towns of history their decay. Nor is its operation limited to physical objects; it acts upon the very stuff of which men's minds are composed, and creates habits

of industry, and develops intelligence, wherever it appears.

Coal, like other great benefactors of mankind, was persecuted in the ages of ignorance, and in London repeatedly prohibited altogether, on account of the supposed injurious tendency of its smoke. Since the time of Charles I., however, its advance into general use has been steady and rapid; and at present the domestic consumption of Great Britain may be safely stated at 20,000,000 tons; that of manufactories at 13,200,000 tons; and that of railways, steamers, &c. at 1,200,000 tons. To these items must be added 4,000,000 exported to Ireland and the colonies, which will give a grand total of 38,400,000 tons. If this is reckoned at an average of ten shillings per ton to the consumer, the whole will be worth L19,200,000 a-year.

Coal-mining, however, is not a very profitable business to those concerned in it. Large fortunes, it is true, have been made from time to time by individuals; but taking the trade on the average, the profits do not exceed ten per cent. on the capital employed, and this at simple interest. It is a business, however, which will always go on; and the supply of the material is considered, by the best observers, to be equal to the present demand for many centuries to come.

Iron, like coal, was at one time persecuted on account of its consumption of wood in the smelting process; but when Lord Dudley obtained a patent in 1619 for smelting with coal—one of the most valuable of all inventions—his works were destroyed by the ignorant rabble, and himself well-nigh ruined. In 1740, when the new process fairly began, the quantity made was 17,000 tons, which in 1840 had increased to 1,396,400 tons. Last year it amounted to 1,750,000 tons. This can only be matched by the progress of the cotton manufacture. It is not supposed that the prosperity of the trade is temporary, but, on the contrary, that it will continue increasing for an indefinite time. Supposing, however, that it remains as it is at present, this will give, as the yearly value of the production, fourteen millions sterling.

About 5000 tons of tin are obtained in the year, at a value of from L65 to L80 a ton. We had formerly a monopoly of this article, and the price was nearly twice higher; but since 1814, the little island of Banca, in the Indian Archipelago, has come into successful competition with us, driving us out of the Chinese market, and even rivalling us at home.

Copper, although fairly commencing only with the last century, is now of more importance than tin; its production increasing from 700 tons to upwards of 14,000 tons, and estimated to be worth L1,406,000 a-year. As a business, both tin and copper mining partakes of the nature of a lottery; the veins that promise most, sometimes disappearing at once, and *vice versa*, making the needy adventurer a capitalist, and the capitalist a beggar, as it may happen.

The lead produced in Great Britain and Ireland amounts to upwards of 51,000 tons, each ton yielding about eight ounces of silver.

Salt is produced to an unlimited extent from brine springs and fossil beds. The home consumption of this article, exclusive of Ireland, is estimated at 200,000 tons, and our exportations amount to 337,000 tons. The average cost is only fifteen shillings a ton. The other minerals are manganese, antimony, stone, slate, fullers' earth, and lime. The consumption of the last is immense, but affords no data for calculation. To these may be added, though perhaps more properly a manufacture, bricks, of which nearly a billion and a-half were made in 1844.

In this survey, the treasures of the sea are worthy of some observation, because the consumption of fish is not now, as formerly, confined to the coasts, but extended by railways throughout the entire kingdom. In Birmingham, for instance—that great terminus—the consumption in 1839 was only 400 tons, and it is now 4000 tons. Of such importance is despatch in the con-

veyance of this perishable commodity, that a mackerel vessel arriving at Billingsgate at five o'clock in the morning, would obtain fifty shillings per hundred for its fish; whereas, if it did not reach the market till the afternoon, the utmost price it could realise would be twenty-eight shillings. Formerly, vans with four horses were employed to hasten up the cargo, which is now transported in a small fraction of the time by means of steam, whether on the road or the river. The entire value of the fisheries, including both foreign and domestic, is stated at from four millions to four millions and a-half a-year. The whale fishery has decreased rapidly, and in the northern seas more especially, the trade is now almost wholly confined to seals.

Such is a general glance at the treasures of the soil, the mine, the sea, with which nature has endowed the inhabitants of Great Britain. Let us now turn to the products of their industry in the manufacture of raw materials into those objects of comfort and utility which form the distinctive character of civilisation.

Our earliest national manufacture is that of wool; and many plans were fallen upon for its encouragement, including the law of Charles II.'s parliament (which was not expunged for a hundred and thirty years), that all dead bodies should be buried in woollen shrouds! The discouragement of machinery had the same tendency as injudicious fostering; and but for the example of cotton after the inventions of Hargreaves and Arkwright, 'the woollen manufacture,' as a writer in Rees's Encyclopædia observes, 'would probably have remained at this day what it was in the earliest ages of civilised society.' At the end of the seventeenth century, the value of the manufacture was estimated at eight millions sterling: it is now twenty-four millions.

In 1766, the value of the different species of cotton goods produced in England—or rather of a mixture of cotton and linen, for there was then no other—was estimated at L.600,000 a-year; but in the following year the spinning-jenny was introduced, which at first enabled eight threads of the web to be spun as easily as one; and eventually was improved to such an extent, that a single young girl was able to work a hundred and twenty spindles. Then came the spinning-frame for the warp, which carried the process to a pitch which might truly be termed miraculous, if we did not remember that, subsequently, the mule-jenny—a compound of these two—spun a thread two hundred and forty miles in length from a single pound of cotton! Hitherto, however, the manufactories were obliged to be pitched wherever a waterfall supplied a motive power; but, as if no obstruction was destined to remain, no element of prosperity to be wanting, the improvements of Watt in the steam-engine set them down in the midst of dense and industrious towns. The invention of the throstle then gave the mule the power of spinning spontaneously with no human intervention but that of children to join the threads; and then the power-loom brought the whole to a climax by weaving, by means of machinery, the yarn in like manner spun. The total value of the cotton goods, of all kinds, is estimated at thirty-six millions a-year; including ten millions as the price of the material, and twenty-six millions for wages and profits. On the most moderate computation, this business must furnish subsistence to considerably more than a million persons. 'And for this new and most prolific source of wealth,' says Mr McCulloch, 'we are indebted partly and principally to the extraordinary genius and talent of a few individuals; but in a great degree, also, to that security of property and freedom of industry which give confidence and energy to all who embark in industrious undertakings, and to that universal diffusion of intelligence which enables them who carry on any work to press every power of nature into the service, and to avail themselves of productive capacities of which a less-instructed people would be wholly ignorant.'

At the Union, the linen manufactured in Scotland was a million and a-half of yards; at present, the value

of what is made at Dundee is a million and a-half sterling. The total value for Great Britain and Ireland is estimated at ten millions.

The manufacture of silk was introduced into England so early as the fourteenth century, and in the sixteenth it had become a considerable and established trade. Towards the close of the seventeenth, however, the importation of foreign silks was prohibited; and the consequence of the monopoly thus granted to the home manufacturer was a total cessation of improvement, and much injury to the business from the competition of smuggled goods. In 1825 this suicidal policy of the government was changed, and the market thrown open, with merely nominal disadvantages, to the foreign manufacturer. The result of this step—from which nothing less than utter ruin was anticipated—has been a vast increase in the silk manufacture, which supports upwards of thirty thousand labourers, and is worth to the country upwards of ten millions sterling a-year.

Birmingham was called by Mr Burke 'the toy-shop of Europe;' but among the toys are vast numbers of guns and swords, and now steam-engines, more important than all the other firearms in the world. So extensive is the button trade alone, that in 1834 a single manufacturer had in his workshop 10,000 double sets of cut steel dies for livery buttons only. In 1824, a manufacturer of another kind received a single order for L.500 worth of dolls' eyes. At present, about 160 tons of fine sheet steel are annually manufactured into 300,000,000 pens. The whole annual value of all sorts of wrought brass and iron, and of hardware and cutlery articles produced in Great Britain, is estimated at seventeen millions sterling.

The manufacture of leather is very nearly equal in value to that of iron, being estimated at sixteen millions.

The earthenware manufacture owed to Mr Wedgwood its increase from a paltry business, in 1762, to one yielding at present from two to three millions a-year. The duties on glass were repealed in 1845, and the advantages anticipated are now in a fair way of being realised.

Mr McCulloch's section relating to paper, books, &c. is unaccountably deficient in the most ordinary information. He does not seem to be aware that there is such a thing as a cheap press in the country. He computes the value of monthly and quarterly periodicals circulating from fifteen hundred to two thousand copies, but entirely omits those that scatter abroad among the people their *weekly* sheets, to the number of eighty or a hundred thousand copies! On this point we speak neither for ourselves, nor for many other and more successful labourers in the field of popular instruction, but for the sake of truth, on a not uninteresting subject of social concern. We are unwilling, however, to do anything more than point out a defect which the author has it in his power to remedy in a subsequent edition.

Breweries, distilleries, manufactories of hats, soap, candles, &c. make up the account of the wonderful industry of this wonderful country.

A SETTLEMENT IN THE WILDERNESS.

The following interesting particulars occur in a small work on emigration, lately published by Wiley and Putnam:—

'In one of the small and rather poor towns on the St Lawrence river, is a certain road of about three miles in length, on which reside at the present moment a number of English and Scotch families. With the exception of one Dutch family, no others than those referred to reside upon this road.

'About twenty years ago these emigrants made up their minds to go to the new world. They were in exceedingly straitened circumstances, but confident that industry and honesty would not fail of their reward. Residing in the north of England, and in the south of Scotland, they took shipping at Hull for Quebec. They had a long and tedious passage, and reached Quebec with their slender means

almost exhausted, ignorant of the country, and of the best means to procure employment. In those days there were no societies to give the emigrant desirable information, nor books to furnish it.

'They resolved to go into the country at all events; a wise determination under such circumstances. By some means they found their way to the town in which they now reside; a small town on the American side of the river St Lawrence.

'They found it a wilderness. Here and there a scattering settlement was to be met with, but not a rood of land cultivated like that to which they had been accustomed in the old country. Everything was new to them: the modes of farming, of living, of buying and selling, of building. The soil was tolerably good, but it was covered with huge trees. Here they resolved to plant themselves, and go to work and make "the wilderness to blossom as the rose." They bought this wild land, on credit, at from two to three dollars the acre, payable in four annual instalments.

'What did they now do? Money they had but little of. Their land was not paid for. A few cooking utensils, scanty bedding, and a little clothing, was all they had, except their strong hands and stout hearts. With these they went to their honest, earnest, laborious work. The land they had purchased lay in a body, and they took farms adjoining each other.

'The first thing to do was to cut down the trees, so as to make a sort of road, though it was so rough, that no wheel-carriage could pass over it for the first year or two. In sleighing time they could get their stuff out and in on sleds. When there was no sleighing, they were obliged to do so on the backs of horses; oftener, however, on their own backs.

'As soon as this apology for a road was laid open, by simply felling the trees, each family went to work, and made a rude, cheap dwelling of logs. With the exception of a few nails, and perhaps half-a-dozen panes of miserable glass, all the materials were produced on the spot by their own hands. The work was all done by themselves from beginning to end; and in a very short time this hardy band of emigrants had homes of their own making in the forest.

'At this stage of their history they had not so much as a foot of land under cultivation, not even a garden. They had the outline of a road before them, and a rude log-cabin to dwell in. These were all.

'Their next step was to begin to subdue the forest, and turn it into fruitful fields. Long and wearisome years of toil lay before them before this could be accomplished; but, nothing daunted, they went to work. The process of clearing was now begun. Each man cut down the huge trees on a few acres the first summer. These trees were cut into logs of a size convenient to be drawn by oxen into piles. These were then set on fire, and suffered to consume. The surface of these few acres was thus cleared of the trees which had stood for centuries upon it, leaving only the stumps sticking up about four feet high. A strong man would clear in this manner perhaps ten acres the first season.

'In the autumn this land was sown with wheat, in which grass seed was mixed. Thus was the first summer spent, and winter came. During the winter more trees were cut down, to be got ready to be burnt in the summer. At last the spring came. In March they began to make maple-sugar, the very first thing their land had yielded them in the way of eatables. They now bored auger-holes in the sugar-maple trees, and putting small wooden spouts in the holes, they caught the sap, which fell in small rude troughs, out of blocks of wood. This was boiled, and made into sugar, a great luxury indeed for them all.

'By and by the snow entirely disappeared. The wheat they had sown on their newly-cleared land was found to be in a vigorous, thrifty state, and they rejoiced, as none but a pioneer emigrant can rejoice, in seeing these pledges of future success. The summer now wore on. The harvest came, and they gathered in a rich crop of wheat from land which, but a short year before, they had seen covered by a thick forest. The grass seed which had been sown with the wheat now struggled up among the wheat stubble, giving pledge that in another year it would furnish hay for the cattle they hoped by that time to have.

'They had thus lived through the first, and usually the worst year of a settler's life. They had endured many hardships it is true, and the little means they brought

with them were hardly sufficient to furnish them with the coarsest fare in the meantime. But the wheat they had raised, together with a hog or two, which each family had managed to rear, gave them a good stock of food to last till another harvest.

'Thus they kept on in their hard toil, till, year after year, they enlarged their clearing, and in time they brought the whole under cultivation. Their comforts also increased year by year. Their families grew more numerous, a real blessing in such circumstances; their road became tolerably fair, cross-roads intersected it, a school-house was got up, a preacher occasionally came in of a Sunday, and everything really thrived.

'At the present time this settlement is really a desirable place of residence. Almost all the original settlers whose history we have been rudely tracing, occupy the lands they first entered upon. Good frame and stone houses and barns have taken the places of the rude log ones. Their lands are all paid for, and there is scarcely a man of them but has money out upon interest. Their sons and daughters have intermarried. Healthy and happy grandchildren gather apples and plums from trees which stand where once the forest stood, and you might search the world over, and not find a healthier, happier, better population than this.'

EARLY RISING.

MANY literary men seem quite regardless of the fact, that their health depends greatly upon the degree of rest, study, and exercise taken; as much so, in fact, as upon the nature and quantity of their food and clothing, and the intervals between their meals. Retiring to bed at an early hour, and rising early, are habits which would be found highly conducive to their health, and well adapted to prepare them for going through their day's work with a refreshed and cheerful spirit. It is also a business-like habit, and that is no small recommendation of an author in the eyes of those from whom he would wish to find encouragement and employment. Let it be remembered, too, that nearly the whole of our great men ascribe the extent and success of their labours to their having accustomed themselves to go early to bed, and rise early in the morning, and to this many have attributed their excellent health and length of life. We can at least speak for ourselves, not that we rise particularly early, but that we follow a rule of going early to bed, and insuring, as far as possible, a good sound sleep. Sound sleep is in fact indispensable to the health of men daily engaged in literary pursuits; without this species of pacification, the nervous system becomes overwrought, and bad health in various distressing forms is the result. Let it therefore not be forgotten that early rising is valuable only so far as it insures early retiring to bed, and the habitual tranquillisation of sleep.

Homer, Horace, Virgil, and numerous other ancient writers, were early risers. But not to go back to so remote a period, let us restrict our examples within the last three centuries. Sir Thomas More, who assures us it was by stealing time from his sleep and meals that he was enabled to complete his 'Utopia,' made it his invariable practice to rise at four; and he became so well convinced of the excellence of the habit, that he represents the Utopians as attending public lectures every morning before daybreak. When Bishop Burnet was at college, his father aroused him to his studies every morning at four o'clock; and he continued the practice of early rising to the end of his life. Bishop Horne states, that during the composition of his very excellent version of the 'Psalms,' 'he arose invariably fresh as the morning to his task.' Sir Matthew Hale always rose early, and studied sixteen hours a-day. Addison, when sojourning at Blois, rose as early as between two and three in summer, but remained in bed till eleven or twelve in the depth of winter. Dr Doddridge says it is to his habit of early rising that the world is indebted for nearly the whole of his valuable works. Fabricius states that 'Linnæus arose very early in summer, mostly about four o'clock; at six he came and break-

fasted with us, about one-eighth of a league distant from his residence, and there gave lectures upon the natural orders of plants, which generally lasted until ten.' Dr Tissot says that Zimmerman was accustomed to rise very early in the morning, and wrote several hours before he began his professional visits. Paley, who in the early part of his college career frittered his time away in the society of idle and extravagant acquaintances, was one morning awakened at five o'clock by a friend, who reproached him with the waste of his time, and of his strong faculties of mind. Struck with the justice of the rebuke, Paley, from that time forward, rose at five o'clock every morning, and continued the practice ever after. It is easy to conceive how this excellent reform contributed to the achievement of the celebrity of the author of 'Evidences of Christianity,' 'Moral Philosophy,' &c. Bishop Jewell rose regularly at four; and Dr Parkhurst the philologist at five in summer and six in winter, in the latter season always making his own fire. Franklin and Priestley, among our philosophers, were early risers. It is to the hours he gained by early rising that we owe the numerous volumes which issued from the pen of Sir Walter Scott. He rose at five o'clock, and lit his own fire when the season required one. By six o'clock he was seated at his desk, which he did not leave till breakfast time, between nine and ten. After breakfast he devoted two hours more to his solitary tasks, and by noon he was, as he used to say, 'his own man.' When the weather was bad, he remained at work incessantly all the morning; but his general rule was to be out on horseback by one o'clock at the latest; while, if any more distant excursion had been proposed overnight, he was ready to start on it by ten; his occasional rainy days of uninterrupted study forming, as he said, a fund in his favour, out of which he was entitled to draw for accommodation whenever the sun shone with special brightness.

PLEASURES OF LABOUR.

It is not uncommon to hear mechanics and other working men repining at their lot in life, especially as compared with that of such as are engaged in the learned professions. In hours of despondency, those are imagined to be happy who are freed from the necessity of manual labour, whether as men of wealth or of letters. Contentment is the best policy. All is not gold that glitters. Inaction is not ease. Money will not purchase happiness. Lords and ladies are often very wretched people; and the instances are numerous in which even kings have thought men of humble stations the happiest. M. d'Alembert relates that Frederick, king of Prussia, once said to him, as they were walking together in the gardens of Sans Souci, 'Do you see that old woman, a poor weeder, asleep on that sunny bank? She is probably happier than either of us.' So also Henry IV. exclaims, in Shakspeare—

'Canst thou, oh partial sleep! give thy repose
To the wet sea-boy in an hour so rude;
And in the calmest and most stillest night,
With all appliances and aids to boot,
Deny it to a king?'

which may remind us of a saying of a greater and wiser king than either: 'The sleep of a labouring man is sweet, whether he eat little or much; but the abundance of the rich will not suffer him to sleep.' And before I dismiss my royal witnesses, let me cite King James I. of England, who used to say that the happiest lot in life was that which set a man below the office of a justice of the peace, and above that of a petty constable. The truth is, labour is not an evil. 'In the sweat of thy face shalt thou eat bread,' sounds like a curse, but has been made a blessing by our benign Creator. Health, strength, and cheerfulness are promoted by the proper use of our bodily powers. Among the Jews, labour was accounted so honourable and so necessary, that every man used to be bred to some trade, that so he might have a resource in case of misfortune. The same sentiment has prevailed in other Eastern nations. One of the Hebrew rabbies has the surname of the Shoemaker, and another of the Baker. Sir Paul Ricaut somewhere mentions that the Grand Seigneur, to whom he was ambassador, had been taught to make wooden spoons. There can-

not be a greater mistake than to suppose that mental exertion is less wearing than the labour of the hands. Head work is the hardest work in the world. The artisan feels this if at any time he has to spend a whole day in calculation. All men of learning testify to the same truth, and their meagre frames and sallow complexions tell a plainer tale than their words. Sir Edward Coke, the great English lawyer, speaks thus concerning his great work: 'Whilst we were in hand with these four parts of the Institutes, we often having occasion to go into the country, did in some sort envy the state of the honest ploughman and other mechanics. For one, when he was at his work, would merrily sing, and the ploughman whistle some self-pleasing tune, and yet their work both proceeded and succeeded; but he that takes upon him to write, doth captivate all the faculties and powers both of his mind and body, and must be only attentive to that which he collecteth, without any expression of joy or cheerfulness while he is at his work.'—*The Working Man; an American publication.*

BROTHER MAN!

BY GOODWYN BARNBY.

God is One, and we are Two—

Brother man, brother man!

Wherefore make so much ado?

Why should differ I and thou?

God is One, and we are Two—

Brother man, brother man!

We are wrong, and God is right—

Brother man, brother man!

Why should difference end in fight?

Why should good be quelled by might?

We are wrong, and God is right—

Brother man, brother man!

We are beads, and God the string—

Brother man, brother man!

If we do not closely cling,

Snapped will be the jewelled ring;

We are beads, and God the string—

Brother man, brother man!

We are parts, and God is All—

Brother man, brother man!

Should our body's members brawl,

Would it not the brain appal?

We are parts, and God is All—

Brother man, brother man!

We are limbs, and God the Head—

Brother man, brother man!

Were the arms to contest led,

Brutes o'er the frame would spread;

We are limbs, and God the Head—

Brother man, brother man!

We are children—God our Sire—

Brother man, brother man!

Let to him each heart aspire,

As to heaven flameth fire;

We are children—God our Sire—

Brother man, brother man!

God has spoke it; we shall see—

Brother man, brother man!

All mankind shall brethren be,

Like the stars in unity—

God has spoke it; we shall see—

Brother man, brother man!

THE POET.

In a poet worthy of that name, the powers of intellect are indissolubly interwoven with the moral feelings, and the exercise of his art depends not more on the perfection of the one than of the other. The poet who does not feel nobly and justly, as well as passionately, will never permanently succeed in making others feel: the forms of error and falseness, infinite in number, are transitory in duration: truth of thought and sentiment, but chiefly of sentiment, truth alone is eternal and unchangeable.—*Curlye's Life of Schiller.*

ONE AND ALL.

THE great mistake of the selfish and the predacious lies in supposing that their own interests can be regularly and securely advanced by throwing the interests of their fellow-creatures at their feet. The fact is, that though one may occasionally be successful to some extent in his efforts to benefit himself at the expense of his neighbours, or by a complete neglect of their interests, there is no dependence to be placed on efforts made in such circumstances; and favourable probabilities are never great, except where the interests of others have also been held in view.

We see a lively illustration of this principle in the affairs of trade. What are usually the most prosperous concerns? Not those which are indifferent to the public convenience or interest; which prefer high to moderate profits; which resist, as long as they can, all improvements by which production and distribution may be made more economical, and therefore cheaper. No: but those which strain to subserve the public needs in every available way, and which seek not how to make dear, but how to make cheap. It is notorious that the manufacturers of England are the most prosperous class. Generally speaking, those concerned in agriculture are at the opposite end of the scale. Why is this? It is because, in manufactures, ever since they commenced amongst us, the leading object has been to produce as economically as possible: the constant tendency has been towards giving the public the utmost possible comfort and enjoyment at the lowest possible cost; while, in agriculture, the interests of the public have been always held as secondary, or rather altogether disregarded. It is, therefore, only right and fitting that the manufacturer should be rewarded with comparatively a high degree of prosperity. He prospers, because, where means are economically applied, there is always most to spare—most generosity in the thing itself towards those dealing in it. The other fails, because poverty naturally attends ill-applied means. To all connected with the respective systems, there is the like measure of resulting benefit. The operatives and servants in the one case receive largely, because of the greater success of the undertakings in which they are engaged. In the other case, they pine on comparatively small dispensings, wrung from a system which the selfish principle has blighted.

However oddly it may sound, benevolence towards the public is the root of all trading success. A man must really wish to do his best to serve his fellow-creatures, and promote their comfort and wellbeing, before he can actually do it; and his actually doing it is indispensable to his own personal success. He must therefore be, as a first and all-important requisite, a benevolent man. Not that the selfish men will not prosper also, or that

benevolent men will not fail. But the man who, with other favourable qualities, is animated by a wish to act in that way which will be most beneficial to his fellow-creatures—he is the man most likely, all common conditions being equal, to carry away the palm. We mean that benevolence is the only safe principle to proceed upon. Take the common ideas respecting trading success, and it will be found that they can all be resolved into this principle. The courtesy expected of the tradesman, his patient attendance, his promptitude to serve, his anxiety to have the best goods at the cheapest charges, are all benevolences towards the public. The success he looks for is but a return of love for love on their part. So he is properly no more selfish in his acts as an upright, well-meaning tradesman, than the philosopher or preacher is selfish who says, 'Love one another;' meaning that by A loving B, B will love A in return, and society be thus sweetened. We thoroughly believe that all the nobly successful men of business would be found to acknowledge that they had thriven because they all along sincerely aimed at what was primarily for the benefit of the public. They would all be found to have been liberal, and not scrubby, in their dealings, and to have in everything studied how they could best second the wishes of their friends and customers to make a certain sum of money go as far as possible for the supply of common human needs.

It is on the same principle that improvements tending to the public convenience and gratification are usually attended by superior profits to those concerned in effecting them. When the railway, with its frequent trains, always sure of giving accommodation, its certainty and rapidity of transit, and the rationality and courtesy of its officials, is substituted for the uncertainty, the narrow accommodations, the slowness, of the comparatively expensive stage-coach, with its barbarian attendants requiring to be bribed into a rough civility, the public feels the benefit to be great; and railways, accordingly, are much resorted to. Hence, while the absolute amount of income from railways exceeds that from all former modes of travelling in an immense degree, the relative success is also great. It is so in the direct ratio of the greater serviceableness of railways to the public; and no one can say that it is not deserved. This should be considered as a great encouragement to those who desire to promote or undertake practical improvements of any kind. There is certainly no department of business, of an important character, which is at present ill done, and attended accordingly by paltry gains, but what might be made the basis of what is called a fortune to persons sufficiently ingenious and energetic to effect an improvement. Take, for example, the hackney-carriages of any of our cities. The circumstances in which these are at present conducted, are such as to be extremely uncomfortable to the public. For one thing, it

seems quite impossible for a stranger to hire such a vehicle without being grossly overcharged at the end of his drive. The appointed fares, though not too high, perhaps, when we consider the plan on which the business is conducted, are not such as to be very convenient for the mass of the public. Unfortunately, however, even when the stranger offers, at the end of his drive, 20 or 30 per cent. above the real fare, it is ten to one that he does not escape without rude demands for more, against which there is practically no redress. Here is a trade which may be said to bear a malevolent aspect towards the public. It stands on the principle of extorting as much as it can, without making even the profession of a wish to be obliging and civil in return. It is, therefore, not in a state which can be satisfactory to itself, any more than to the public. A company is proposing to put it on the opposite footing of benevolence towards the public; that is to say, to furnish carriages at 33½ per cent. less fares, and these to be provided with mechanism which will determine the distance passed over with unflinching accuracy, so that overcharges, and all disputes attending upon them, will no longer be to be dreaded. Should this plan be realised with the requisite skill and energy, and should the fares prove to be not below what expenses would demand, it can scarcely fail to be successful to the profit of its originators, for the public must of course give it a preference. The success of such a concern is not a mere commonplace; it is a fact bearing strongly on the philosophy of social happiness. The Mile Index Cab Company, or by whatever other name it is called, will get its better profits precisely as we get affection from our children—by being kind to them; or as the amiable man acquires popularity—by loving, and therefore being in return beloved.

Unfortunately, there is a drawback from the prosperity of benevolent systems and practices—that all such are continually in the way of sustaining damage from affairs of an opposite kind. The manufacturer, for example, is impeded and injured because food, the grand material of his exertions, is not as yet obtainable on the same economical principle as his wares. Every enlightened and gracious thing in our state has to struggle with the taxing barbarisms which surround it on every side. The liberal-dealing country is condemned to precarious markets, in consequence of the prevalence of opposite principles in neighbouring countries. Another influence acts detrimentally; it is the prevalence of mean suspicions that men who act disinterestedly have a sinister object in view. The world has been so much accustomed to see things conducted on selfish principles, that it can hardly be brought to believe in the possibility of virtue. If the upright man be successful, he is just the more likely to be made a mark for malevolence. We know parties who systematically withdraw all friendship from men as soon as they assume the appearance of success. Every person, however, who does his duty, must be prepared to withstand or disregard such influences and feelings. Engaged in a great and noble enterprise, he must learn to pity detractors, and draw happiness from the consciousness of integrity.*

It is to be lamented that there is so little unanimity with respect to individual and general interests. Could mankind be persuaded to view the subject on all its sides, they would find that there is no such thing as an individual or isolated interest in this world. It is the short-sighted alone who think so; and bitterly do they, in general, pay for the error. The true test of everything that professes to be of a beneficial character is—Is it for the benefit of ONE AND ALL? The ordinance

* Conversing the other day with a merchant from the United States, he said that, professionally, he remarked a striking difference between the feelings of tradesmen with respect to each other in Great Britain and America. In some places in England and Scotland, any man's success seemed to be too frequently considered a loss to others; whereas the more common doctrine in America is, that individual is inseparable from general prosperity, and is matter for rejoicing accordingly. We give this as the impression of a man of some experience, without vouching for its general accuracy.

for the social state of man has introduced this mutual dependence of interests. Everything that mars or thwarts it, is naught, and can hardly come to good. It is only by a reverent attention to it, that the happiness of each unit can be attained.

THE TWO HOMES.

A STORY FOR WIVES.

Our story begins—as most other stories terminate—with a wedding. And yet how often is marriage but the entrance-gate of life, when the romantic girl must inevitably merge into the thinking and acting woman, and she who has hitherto lived within herself and to herself, must learn to live for another. She steps from the altar into a new existence, requiring new energies and new feelings; she enters on a path as yet untried, in which there is much to be overcome, and in which she has need of all help from her own heart and from Heaven.

Mr Stratford, the rich banker, gave away at the marriage altar, on the same day, his only daughter and his niece. The fortunate bridegroom who won the former was Sir Francis Lester, a baronet of ancient and honourable family. The husband of the latter was of lower standing in society—plain Henry Wolferstan, Esq. a gentleman whose worldly wealth consisted in that often visionary income, a 'small independence,' added to an office under government which yielded a few hundreds per annum. These were the two who carried away in triumph the beautiful heiress and the graceful but portionless niece of Mr Stratford.

With the usual April tears, the two young brides departed. A stately carriage-and-four conveyed Sir Francis and Lady Lester to the hall of a noble relative; while the humbler railway whirled Henry and Emily Wolferstan to the antique country mansion, where a new mother and sisters awaited the orphan. And thus passed the honeymoon of both cousins, different, and yet the same; for in the lordly abode, and in the comfortable dwelling of an English squire, was alike the sunshine of first, young, happy love.

In a few weeks the two couples came home. How sweet the word sounded, 'our home!' What a sunny vista of coming years does it open to the view, of joys to be shared together, and cares divided—that seem, when thus lightened, no burden at all. Sir Francis Lester forgot his dignity in his happiness as he lifted his young wife from her downy-cushioned equipage, and led her through a lane of smiling, bowing, white-ribboned domestics, up the noble staircase of his splendid house in — Square. Hand in hand the happy pair wandered through the magnificent rooms, in which taste refined and increased the luxuries of wealth. Emily was never weary of admiring, and her husband only looked in her eyes for his delight and reward. At last, exhausted with her pleasure, Lady Lester threw herself on a damask couch. 'I can do no more to-day; I am quite wearied.'

'Wearied of home—of me—of what?' said Sir Francis smiling.

'No, no,' answered the bride, looking proudly at her husband, and playing with his jewelled fingers; 'only wearied with being so happy.'

'I hope you may always have that excuse, dearest. But now we must not give way to laziness: my mother is coming to-night, you know; and I want my Emily to be brilliant and beautiful—more than usual, if possible.'

'Indeed I do not care: all the mothers in the world would not induce me to rise and have the fatigue of dressing and dining in state to-night.'

Sir Francis looked annoyed; but he had been married too short a time to do more than look. 'As you will, Emily,' he said; 'but I wished—'

There was something in his tone that made the wife look up. She saw the expression, and repented. 'You wished—and I will do anything you wish, now and always,' whispered her beautiful lips in his ear, and the

shadow was gone from between the two—swept away by the touch of love.

Half a mile from the abode of Sir Francis Lester was the home of Mr and Mrs Wolferstan. It was one of those pleasant houses that a generation now past used to erect in the suburbs of London. White, modern-built terraces and formal squares have risen up around, but the old houses still remain here and there, with their barrier of trees, or low privet hedges, against the dusty road; their little gardens and brown walls covered with ivy, or woodbine, or thick-leaved vines. To one of these pretty dwellings Henry Wolferstan brought home his bride.

It was an evening in September, chilly enough to make a fire welcome, when Henry and Eunice sat for the first time by their own hearth together. The ruddy firelight gleamed on the young wife's face as she presided at the tea-table; while her husband, resting at his ease in an arm-chair, watched with his affectionate eyes every movement of the delicate little hand that fidgeted about in matronly dignity. How happy they were! After all the trials of a love whose course had been often ruffled by worldly cares and hindrances, to find themselves at last in a still haven—a happy, wedded home! Eunice looked round the cheerful room; the books, the well-chosen prints, silent, beautiful companions, which they both loved so much; and the open pianoforte—all seemed to speak of future comfort and happiness. And then she saw beside her the face that had been for years the sunshine of her life, and knew that he was her husband; that they would never be parted more; that the love between them would be as an ever-living fountain, daily springing up anew to freshen and brighten their united life. All this came upon the full heart of the young wife, and she fairly burst into tears. Happy, blessed tears they were, quickly kissed away, and changed into smiles!

Many and many a time in after-years did the young couple call to mind that first happy evening in their own home—how they looked over their treasures, their household gods! and Eunice touched her new piano, and sang; but her voice trembled; so at last they came and sat by the fireside—like John Anderson and his spouse, as Henry laughingly said—and built castles in the air; the jests always ending in seriousness, for they were too happy to be very mirthful.

Time glides away fast enough with every one, and most of all with those whose life is untroubled. Eunice had been married six months before she began to think how long it was since she had resigned her hand into Henry's loving keeping. Yet short as the time seemed, it was sufficient to make the former life of both appear like a dream. They had already settled down into a calm, sedate married pair. Sometimes people jested with them upon restricted freedom and marriage fetters; but Henry Wolferstan only laughed—he was ever of a merry mood—and asked if any man or woman, single or not, could ever truly say they had their liberty. And in good truth it is well it should be so; for such liberty would be a sore burden sometimes.

Mrs Wolferstan still kept up her intercourse with her cousin, for Emily was of too generous a disposition to make the difference in station a bar to such old friendship. Still there was in the world's eyes a distinction between the wife of a rich baronet and of a gentleman of limited income; and, still more than this, there was the difference of habits, thoughts, feelings, which the position of the two cousins naturally brought about; so that, if the intercourse of the two wives gradually narrowed, it was not very surprising. Eunice never returned from the square, which breathed the very atmosphere of gaiety and splendour, without feeling a sense of relief on entering the quiet precincts of her own home.

One day she came earlier than usual to visit Lady Lester, whom she found still in her dressing-room. Emily lay seemingly half-asleep; but when Eunice drew aside the rose-coloured curtains, and let in the

warm noon sunshine, she saw the pale face and swollen eyes that were beneath the rich lace cap. Before she had time to speak, Lady Lester observed, 'Well, Eunice, my husband and I have had our first quarrel.'

'I am sorry—truly sorry. And Sir Francis—'

'Do not speak of him: he is unkind, proud, obstinate.'

'Hush!' said Eunice, laying her finger on Emily's lips; 'you must not speak thus—not even to your cousin.'

'I must tell you—I will not be contradicted,' answered the young beauty resolutely. And Mrs Wolferstan thought that to listen would perhaps be the wisest course, though she knew the evil of such confidences in general.

'I do not see half enough of my husband,' continued Emily. 'He is always going out—not with me, but alone, or with that disagreeable mother of his, whom I hate to see in my house; yet she makes it like her own, and I am thought nobody—I, the wife of Sir Francis! I intreated him this morning not to ask her so much, to let her leave us alone together, and that he would stay at home a little more. But he was very angry: not passionate, for that he never is—I often wish he were—it would be better than his cold formal manner when he is displeased.'

'Was that all?' asked Eunice.

'Not quite. I told him he ought not to leave me so much—that I would not suffer it. And he answered in his quiet way, "When Lady Lester makes her society not quite so dull, it will have more charms for her husband." And so he went away. I will make him repent it, though,' said Emily, while the hot flush mounted on her brow. Eunice saw at once that it was no time for even gentle reproofs, and besides, Emily was not all in the wrong; there was much to be laid to the charge of her husband also. Scarcely had Mrs Wolferstan succeeded in calming her friend, and just as she was beginning to think how she might best frame salutary but tender advice, the mother-in-law of Lady Lester entered.

The hasty greeting between the wife and mother of Sir Francis showed mutual dislike. Eunice contrasted the tall, harsh-voiced, frigid lady before her with the gentle woman who was Henry's mother, and her own, too, in love, which made the formidable title of mother-in-law but a name for a most sweet bond. Thinking of this, how much she pitied Emily! Had she not heard the confession of her cousin, the one half-hour during which she listened painfully to the abrupt, coldly polite, or sarcastic speeches that passed between the lady and her son's wife, was enough to convince Eunice that she was in a house of strife. She rose to depart; for it was vain to hope for more conversation with Emily. As she bade her cousin adieu in the anteroom, Eunice could just find time to whisper, 'Dearest Emily, when I married, a wise and true friend said to me, "Take care of the first quarrel!" I did so: Henry and I have not had our first quarrel yet. Listen to me. At all risks, end yours; make any sacrifices to be friends; and never, never have another. God bless and help you! and good-by.'

The wise Solomon says, 'The beginning of strife is like the letting out of water.' Alas! if they who first open the fountain did but know into what a fearful river of woe it soon swells, sweeping away everything in its overwhelming tide. Emily Lester was wise enough to follow her cousin's advice; she did make up the quarrel, as a loving and still beloved wife almost always can, and no other tie has the same influence. But Sir Francis, though gifted with many high qualities, was a difficult temper to bear with and guide. His character and pursuits were fixed before he married; his wife must mould her nature to his, for he would never bend his to hers. He loved Emily fondly, but he regarded her, probably from the difference in their years, more as a plaything than an equal. After the silken fetters of the lover were broken, he would never brook the shadow of control. To give him an idea that

he was ruled, was to lose that power for ever. Emily had truly called him obstinate; for the same quality that made him firm in a good purpose, made him resolute in an erring one. To thwart him, was but to strengthen his iron will. Yet he was a man of high principle and feeling; but he required to be lured by smiles to a cheerful home, instead of being driven away by frowns and murmurs.

Let us pass over another year, and again visit the two homes. A mother's bliss had come to both: the heir of Sir Francis Lester was received with triumphant joy, and cradled in satin and down; while the first-born of Henry Wolferstan was laid in its mother's bosom with a tearful but not less happy welcome. Life had become very sweet to Henry and Eunice; their cup of joy was running over. Too much bliss is a snare to the wisest; and therefore, perhaps, it was for the best that, before many months had passed over the babe whose advent had given so much happiness, a shadow gathered on the path of the young parents.

Eunice sat waiting for her husband's daily return from town. Sleep had closed the eyes of her little Lily—the child's name was Lavinia, but they called her Lily, and very like was she to that sweet flower, especially now as she lay asleep, like a lily folded among its leaves. Eunice's fingers were busy in fabricating a christening robe for her darling; and the mother's heart kept pace with their quick movements, travelling over future years, until she smiled at herself to think how earnestly she had been considering the making of the bridal dress of the babe of three months old that lay unconsciously sleeping by her side.

A little later than his accustomed hour—for he was generally very punctual—Henry came in. He looked pale, and his eye was troubled, but he kissed his wife with his usual affection, perhaps even more. Still, Eunice saw that all was not right. She waited for him to tell her: he always did; but this night he was silent. A few passing questions Eunice put, but they were answered so shortly, that the wife saw that that plan would never do; so she tried to distract his attention by speaking of Lily and the christening.

'See, Henry, how beautiful she will look in her robe—the darling!' said the mother, unfolding it, and displaying the delicate fabric.

Henry covered his face. 'Take it away!' he said, in tones of deep pain. 'I cannot think of such things. Eunice, I ought to tell you, and yet I dare not.'

'What is it you dare not tell me, my own Henry?' said Eunice, softly putting her arm round his neck. 'Nothing wrong, I am sure; and even if so, you know I will forgive.'

'I have not done wrong, Eunice; it might be foolish, but it was not wrong.'

'What was it, Henry, love?' said a voice so low, that it might have only been that of his own heart urging the confession.

'I will tell you. You know my brother George, how wild he is, and always was? Well, he came to me a year ago: he had a good situation offered him, but they required a surety; and George implored me on his knees to save him, and give him a chance of reforming. I did so. I was bound for him to the extent of our little all—poor Lily's fortune—and he has just fled to America—a thief! defrauding his master, and also me. Eunice, we have now only my salary to live upon. This is the trouble that weighs me down.'

'Is that all?' said the wife. 'Then we will bear it together. It is nothing—nothing,' and she smiled through her tears.

Her husband looked surprised. 'Eunice, do you know that we shall be much poorer than we are now? that we must give up many comforts? and the poor babe growing up too. Oh how foolish I have been!'

'Never mind the past now, dear Henry: I have only one thing to complain of—that you did not tell me sooner.'

'You have indeed a right to do so,' said Henry slowly

and painfully. 'I know it: I have brought this upon you; I have made my wife poor.'

Eunice looked at her husband with eyes overflowing with love. 'Henry,' she answered, 'since you speak thus, I also must think of myself. I must remember that I brought you no fortune; that I owe all to you—home, food, raiment; that, in making me your wife, the gifts were all on your side, for I had nothing. When I consider this, what right have I to complain of reduced luxuries—nay, even of poverty?'

'You are my own noble-minded wife,' cried Henry, folding her in his arms. 'The richest treasure I ever had was the woman's heart you brought me.'

Thus even adverse fortune without could only throw a passing shadow on that blessed, united home.

The birth of their son drew a little nearer the hearts of Sir Francis Lester and his wife, but their life had been too long a troubled current to receive more than a temporary calm. When Sir Francis stooped from his usual dignified reserve to fondle his child, with the pride of a new-made father, these caresses, after the first pleasure was over, gave a jealous pang to Emily's heart. She was absolutely jealous of the babe, attributing her husband's more frequent society to his delight in his son and heir. She even doubted the increased fondness of manner that he evinced towards herself; until, repulsed by her coldness and vague hints, he again sought abroad the comfort that was denied him in his splendid but joyless home.

From that home Sir Francis became more and more estranged. His wife rarely saw him in the day, and midnight often found him absent. If she complained, or questioned him whither he was going, or where he had been, his sole answer was silence or haughty reserve. In the early days of their marriage, Emily had often won her way, even against her husband's will, by tears or caresses. But the former were useless now; the latter she was too proud to try. Only the shadow of her olden love lingered in the wife's heart, and in its stead had come distrust, and jealousy, and wounded pride.

One morning daybreak saw Lady Lester returning from a ball alone, for her husband now seldom accompanied her. As she entered, her first inquiry of the heavy-eyed domestic was if his master had returned. He had not; and this was only one of many nights that Sir Francis had outstayed the daylight. Lady Lester compressed her lips in anger, and retired; but she had scarcely gained her room ere Sir Francis entered.

'You are out late?' said Emily. He made no answer. 'Where have you been?' she continued.

'Nowhere of consequence, at least not to you.'

'Sir Francis Lester, you are mistaken,' answered Emily, trying to speak calmly, though she trembled violently. 'I have a right to know where you go and what you do—the right of a wife.'

'Do not annoy yourself and me; I never interfere with your proceedings.'

'Because you know there is no evil in them. I have nothing to hide which you have.'

'How do you know that?'

'Because, if you were not doing wrong, why should you stay out night after night, as now? There must be a cause for this; and shall I tell you what I think—what the world thinks? That you gamble!'

'The world lies!' cried Sir Francis, the words hissing through his white lips; but he became calm in a moment. 'I beg your pardon, Lady Lester; I will say good-night.'

'Answer me, Francis!' said his wife much agitated. 'Where do you go, and why? Only tell me.'

'I will not,' replied he. 'The curiosity of a wife who doubts her husband is not worth satisfying. Good-night.'

Emily pressed her throbbing forehead against the cushions of a sofa, and wept long in silence and solitude. Ere morning dawned upon her sleepless eyes, she had resolved what to do. 'I will know,' muttered the un-

happy wife, as she thought over the plan on which she had determined. 'Come what may, I will know where he goes. He shall find I am equal to him yet.'

Two days after, Sir Francis Lester, his wife, and mother, were seated at the well-lighted dinner-table. There was no other guest—a rare circumstance, for a visitor was ever welcome to break the dull tedium of a family *tête-à-tête*. Alas for those homes in which such is the case! Silently and formally sat Lady Lester at the head of her husband's table. How cheerless it was in its cold grandeur! with the servants gliding stealthily about, and the three who owned this solemn state exchanging a few words of freezing civility, and then relapsing into silence. When the servants had retired, Sir Francis uttered a few remarks in his usual tone—perhaps a little kinder than ordinary—to his wife; but she made no effort to reply, and he turned to his mother. They talked a while, and then the elder Lady Lester rose to retire.

Emily's pale cheek grew a shade whiter as she said, 'Before we leave, I have a word to say to my husband.'

Sir Francis lifted his eyes, and his mother observed sharply, 'Perhaps I had better retire?'

'As you will,' Lady Lester replied with a sneering emphasis. Oh how different from sweet Emily Stratford of old! 'But it might be an unpleasant novelty to Sir Francis to hear his wife without his mother's presence!'

'What is all this?' coldly said the husband.

'Merely, Sir Francis, that what you refused to tell me, I have learned. I know where, and how, you pass the evenings in which your wife is not worthy to share your society; I know also where you spent last night. A noble thing, a very noble thing for Sir Francis Lester to be squandering his own—ay, and his wife's—fortune in a gaming-house!'

Sir Francis started from the table. 'It is false!' he said, while the blue veins rose like knots on his forehead.

'It is true,' Emily answered. 'I know it.'

'May I ask how?'

'By the evidence of one who saw you enter the house.'

'And shall I tell you, Francis, how that evidence was gained?' said his mother in the calm biting tone she well knew how to use. 'I now see why Lady Lester gave yesterday and to-day two such long audiences to her father's old servant, and why she needed his assistance so much—to be a spy upon her husband!'

Sir Francis clenched his hands involuntarily, and looking fixedly at his wife, said, in a tone so low and suppressed that it became almost a whisper, 'Emily Lester, is this true?'

Much as Lady Lester had erred, she was not yet so far advanced in the ways of wrong as to veil that error by a falsehood; she answered steadily, though a deep blush spread itself over her face and neck, 'Yes it is!'

Her husband, to Emily's great surprise, did not answer a syllable. His head was bent, and his features immovable. He offered no justification, uttered no reproaches, and his silence irritated her beyond all bounds. Amidst violent bursts of sobbing, she poured out a torrent of recriminations: all her forced calmness had departed, and she upbraided Sir Francis with the bitterness of an injured wife.

'I have endured too long—I will endure no more,' she cried. 'You trust me not, and therefore you cannot love me. I will go to one who does both—my kind, dear father. I will leave you—we must part.'

'We will part,' said Sir Francis in a tone of freezing coldness, that went like an ice-bolt to Emily's heart. Her husband rose up, walked slowly and firmly to the door, but when he reached it, he staggered, and felt about for the handle, like one who was blind. In another minute the hall door closed, and he was gone.

Emily sat as he had left her, but her tears flowed no longer: she was as still and white as a marble statue. The mother-in-law stormed, sneered, reviled; but she might as well have talked to the dead. At last she went away. When the servants entered to remove the

dessert, they found their mistress still in her seat, half-leaning on the table, but perfectly insensible.

Eunice Wolferstan was roused from the contemplation of her own reverses to soothe the unfortunate Emily. For two days, during which her delirium lasted, no news of Sir Francis came to his wife. His supposed guilt became as nothing compared to the fear lest he should take her wild words in earnest, and that they should part. But this fear soon became an agonizing certainty. In a letter to Emily's father, Sir Francis declared his intention to return no more to the home his wife occupied; that all her own fortune, and a portion of his, should be settled upon her, but that henceforth they must be separated. In vain the poor old father, his natural anger subdued by witnessing the agony of his child, pleaded for her. Sir Francis was resolute. That his wife should have dared to discover what he chose to conceal, was a deep offence in his eyes; but that she should have set a servant to watch him—no power on earth would have made the haughty Sir Francis Lester forgive that.

The desolate wife prayed her cousin to try her power to soften his obstinate will; for Sir Francis had ever respected the high but gentle spirit of Eunice. She went, strong in her woman's influence: her words touched even him, as she could see by the changing of his countenance. He bore more from her than from any one; for man will sometimes bow to the sway of a high-souled, pure-minded woman, when he will not listen to his brother man. Eunice pleaded Emily's sorrow—her love; but all failed to move Sir Francis. Then she spoke of the child; and at the mention of his boy, she saw the very lips of Sir Francis quiver.

'You will take him away from her? Poor Emily's heart will break to lose both husband and child.'

'Mrs Wolferstan, I wish to be just to myself—not cruel to her. I would not take the child from his mother, though it is hard to part with my boy.' And the father's voice trembled, until, erring as she thought him, Eunice felt compassion for the stern, unyielding, yet broken-hearted man.

'Oh,' she thought, 'had poor Emily only known how to guide this lofty spirit!'

Sir Francis continued, 'When Lady Lester and I are parted, I could wish the world to know as little about the fact as possible. You can say incompatibility of temper was the cause, or anything you will; but let there be no shadow cast on her fair fame—or mine.'

'Emily need fear none,' answered Eunice. 'And you—'

Sir Francis drew up his tall figure proudly—'Nor I neither, Mrs Wolferstan. To a wife who insults her husband by mean suspicions, no explanations are due. But I owe it to myself to say, and I wish you to know also, that Emily was deceived; that I never stooped to a vice so detestable as gambling; and that the nights I spent in torture amidst scenes I loathe, were devoted to the attempt to save from ruin a friend whom I loved as a brother. Now judge me as you will.'

Eunice could only mourn that the little cloud which had risen between the husband and wife had so darkened the vision of both. But it was past now: no peace-making could restore the alienated love. Once only did Sir Francis and his wife meet: it was on the signing of the deed of settlement. A cold bend of salutation was all that passed between the two who had once loved so fondly. Sir Francis preserved his old reserve and calmness of manner; Emily strove to maintain equal composure, and the excitement of her mind gave her strength. Sir Francis placed his signature on the fatal parchment, and then her father led Emily to the table. She gave one wild imploring look at her husband—but his face seemed passionless: there was no hope. She took the pen, wrote her name, her fingers, her whole frame, grew rigid, and without a sigh or moan she fainted at his feet.

It was over: Sir Francis went abroad: and the young wife, widowed by her own deed, was left alone. But

for the babe who remained to cling round her neck, and look at her with eyes like those of the husband whom she had lost, Emily's reason would have left her. The magnificent house was closed; and she took up her abode in the home from which she had been taken a beautiful and happy bride. Thither the loving care of Eunice followed her still; and Emily gradually became calmer, and wiser, and better, under the guidance of her cousin. Eunice's own path was far from smooth. In her first high-hearted fearlessness of poverty, her very ignorance had made her courageous. Now she came to experience how bitter are those trifling but gnawing cares that those who have known the comfort of easy circumstances feel so keenly; how wearying is the constant struggle to spin a sovereign into the longest thread of gold-wire possible. The grim ogre, poverty, whom the brave heart of Eunice had at first repulsed so cheerfully and boldly, had his revenge by all sorts of sly assaults. But in time she bore them better, and felt them less; and it was a balm to all sorrow to know how much she was loved, ay, and revered too, as a good and virtuous wife, 'whose price is above rubies,' ought to be by her husband. And day by day were their hearts knitted together. She, in loving obedience, yielded willingly, and therefore most sweetly, bending her mind to his in all good things; and he guiding and protecting her, as the stronger should the weaker, in a union in which neither ought to strive for the pre-eminence, unless it be the pre-eminence of love.

For two years only was Eunice fated to know the soreness of altered fortunes. Conscience overtook the brother whose sin had caused so much pain: he died, and restored all to the master whom he had defrauded. The master was a just man, and dealt equally well with Henry Wolferstan; so that fortune again smiled upon him. He left the small house where Eunice had learned the hard lesson of poverty, and returned to the same pleasant home where he had brought his bride.

There, after four years had passed over her head, let us look at Eunice, now in the summer of womanhood, wifehood, motherhood. It was high summer too on the earth; and through the French windows of the room where Eunice sat, came the perfume of roses from the garden. Bees hummed among the leaves of the mulberry-tree, luring sweet Lily from her A B C to her favourite seat under its boughs. The child looked wistfully towards her little cousin, Sidney Lester, who was sporting among the flowers, and all her mother's words failed to attract her attention, until the lesson was happily broken in upon by a visitor. Lily scampered away—the unannounced guest entered—and Eunice looked upon the face of Sir Francis Lester!

She had never seen him since the day of the signing of the deed; and time, travel, it might be suffering, had changed him much. He looked now like a man whose prime was past; his hair was turning gray, and he had lost much of his stately carriage. When he spoke, too, there was a softness in his voice that it had not before; perhaps it was at the gentleness, even to tears, which Eunice evinced at seeing him so unexpectedly.

He said he had come on urgent business to England; he should soon return to Italy, and would not go without seeing Mrs Wolferstan. After a while he asked after his boy; and then Emily's name was on her husband's lips. As he spoke, he turned his head away, and looked out of the window, but immediately started back, saying, 'I understood—I heard—that Lady Lester was in the country?'

'She and Sidney returned to-day, but I feared to tell you they were here,' answered Eunice softly.

'Is that my boy? I must see him;' and the father's eyes eagerly returned to where Sidney stood on the garden seat, supporting himself by one rosy arm thrown round his mother's neck, as he pulled the mulberry-leaves within his reach. Emily sat still—not the brilliant Emily of yore, but calm, thoughtful, subdued; even the light of a mother's love could not altogether remove the soft sadness from her face. How little she

knew whose eyes were gazing upon her now! 'I must speak to my Sidney,' at last said Sir Francis in changed and broken accents. 'Will you bring him to me?'

'They are coming now,' Eunice answered.

'Then I will retire to the other room: I cannot, I will not see her.' And Sir Francis, with his freezing manner of old, walked away just before Emily entered with her child.

'Sidney, come with me,' said Eunice, stooping over the boy to hide her agitation; 'some one wants to see you.'

'Who is it?' asked Emily.

'An old acquaintance; that is, a stranger,' hurriedly said Mrs Wolferstan, so new in the art of stratagem, that Emily at once guessed the fact. She trembled violently, and sat down; but when Eunice took Sidney's hand to lead him away, the mother interposed.

'Not so, Eunice; you cannot deceive me,' she said firmly. 'I see it all; and no one but myself shall take Sidney to his father, and my husband.' She lifted the boy in her arms, suffered Eunice to open the door, went in, and closed it after her.

For a whole half-hour, which seemed a day in length, did Eunice sit without, waiting for the result of that interview on which joy or misery, life or death, seemed to hang. She heard no sound; all was still. She hardly dared to hope; she could not even think; only her affectionate heart lifted up a wordless aspiration, too indistinct to be even a prayer.

At last the child's voice within called loudly and fearfully, 'Aunt Eunice—Aunt Eunice, come!' Eunice went trembling. Emily had fainted; but she lay in her husband's arms; her colourless face rested on his shoulder, and heavy tears were falling on that poor pale face from the stern eyes of Sir Francis Lester.

They were reconciled! Love had triumphed over pride, wrath, obstinacy; and the husband and wife were again reunited with an affection passing that even of bride and bridegroom, for it had been tried in the furnace of suffering, and had come out the pure gold of love—patient, long-enduring love.

In the home to which Sir Francis once more brought his loving and now worthily-beloved wife there was no more coldness, no dull weariness, no estrangement. Perhaps it was a fortunate thing for the married pair that the mother of Sir Francis could no longer discover the bonds that closed again and for ever: she slept beneath a marble monument, as frigid, and stately, and hollow as she herself in life had been.

Perfect bliss is never known in this world; yet if there can be a heaven upon earth, it is that of a happy home, where love—not girlhood's romantic ideal, but strong, deep, all-hallowing, household love—is the sunshine that pervades everything within its charmed circle of union. With this blessed sunshine resting upon them, let us take our last look at the Two Homes.

VISIT TO THE HOSPITAL FOR CONSUMPTION.

Among the noble monuments to the generosity of British charity, and to the expansiveness of its sympathy, there is not one which possesses more interest at the present moment than the Hospital for Consumption and Diseases of the Chest, recently opened in the vicinity of London. It is situated west from the metropolis, in the high road from Brompton to Fulham; and those who have a leisure hour to spare, will be well repaid for their time in inspecting the admirable internal arrangements of this institution. To others who are at a distance, I may be permitted to submit the following sketch of a visit recently made to it.

The locality in which it has been decided to erect this hospital is widely celebrated for its mild atmosphere, and has long been the resort of the consumptive, forbidden by circumstances, or the severity of their disease, to seek the genial air of the south. It is situated upon an open site, a little withdrawn from the highway, and commands from its summit, and from the windows

of the patients' wards, a very fair prospect, extending for some distance in the direction of Kensington and its vicinity. It is surrounded by a space of ground now being laid out as a garden, and intended for the exercise and amusement of such patients as are able to endure the exposure to open air: in fine weather, the invalids appear to take much pleasure in it. The structure itself rather resembles an Elizabethan palace than an hospital: it is built of red brick, relieved by copings and architectural ornaments of white sandstone. There is a profusion of these uncouth monstrosities in the shape of anomalous and unheard-of brutes, and hideous gaping heads, and grinning faces of every degree of deformity, which appear to form essential characters of that style of building; and which, if they serve no other end, are some of them ugly enough to provoke a smile upon the face of the most wo-begone tenant of the building. If there be any lovers of natural history among the patients, these ornaments are well calculated to throw an entirely new light upon their minds as to the relative proportions of the heads and bodies of animals: for the honour of the science, one cannot help hoping there really are no such half-starved lions and unicorns, and no such hybrid monsters in all creation, as are portrayed there. But this by the way. At present, from a deficiency of funds, the centre and right wing of the hospital is all that is yet completed; but when that difficulty is removed—I trust it will not long remain one—the building will form an elegant addition to the architectural ornaments of the metropolis, and will assume its proper rank as one of the 'lions' of London. Some idea of the character of the building may be formed from the fact, that the cost of the present portion of it has considerably exceeded thirteen thousand pounds, which does not include another large sum for its fitting up internally. But we have been long enough outside; let us enter. On entering, a remarkable sensation of warmth is experienced, which can be compared only to that of entering a thoroughly well-warmed and ventilated sitting-room. This feeling is in striking contrast with that commonly felt upon entering the chilly, ill-ventilated hall of other hospitals; and the total absence of the indefinable, close, disagreeable odour of a large medical institution, is particularly worthy of remark. Only those who will remember the irritable lungs of the consumptive, will appreciate this apparently trivial circumstance at its proper value. A handsome stone staircase, enriched with a fine-painted window, a gift from one of the governors, and illustrated with appropriate subjects, faces the entrance, and is the main communication between the male and female wards, which are upon different storeys of the building. I was first conducted to the basement, whither I would be accompanied by my reader.

One of the most interesting features of this hospital is the system of ventilation, which has been submitted to the care of the great thermal philosopher, Dr Arnott. The apparatus is on the basement floor, and is under the care of an engineer, who, according to the circumstances of the weather, and external temperature, is able, by a simple arrangement, to regulate the heat and supply of air to the remotest end of the entire structure. The air-engine room is a good-sized vault, at the opposite side of which the visitor will see a beam in motion, which, if he be anything of a mechanic, will forcibly remind him of some of the earlier forms of the steam-engine beam. It is of wood, having a segment of a circle at either end connected to the cord which moves the pistons, of which there is one at each end. These rise and fall alternately, in a long wooden chest, about seven feet in depth by fourteen in length, and about a yard in diameter. This chest is partly in the vault, and the farthest side of it is shut out of the vault by a wooden partition, which completely cuts off all communication between the hither and further divisions of the room. Thus three parts of the chest are in the vault on this side, and the remaining fourth opens into another room: through a door in

the partition we enter into the other portion of the vault, and there we can form a clear conception of the object of this apparatus. This is a small room, and forms, in fact, the air-chamber of the ventilating machinery. In the side of the chest which looks into this room there are four large apertures, protected by a light grating of iron-wire, against which flaps of India-rubber cloth inside the chest are heard to strike at each motion of the piston, while in the intervals air is felt to rush rapidly through the uplifted flaps into the interior of the chest. Connected with this side of the chest is a subsidiary air receptacle, which appears to be a reservoir for the reception of any extra pressure of air in the apparatus. At the extremity of this room is an unglazed window, protected by wooden cross-bars, and having a shutter adapted to it in such a manner as to regulate the amount of air admitted to the air-chest by a very simple method—the shutter consisting of three hinged flaps, which can be laid back in succession, or brought forward to exclude a certain portion of air, if the supply be too abundant. The interior of the chest contains a set of double bellows, which are worked by the pistons, and expel the air into a common channel, which conveys it away. At present, the machinery is moved by hand-power, but a small steam-engine is being erected for this purpose. It is to work night and day without intermission. Returning to the other division of the vault, we observe at one side a recess, which contains the stoves. The heating apparatus is simple, and will be readily understood. It consists of two large Arnott stoves, which are surrounded by cases containing water, the whole being bricked in to economise the heat. Immediately above the stoves is a large reservoir of water, from the bottom of which two pipes proceed, and are connected to the water-cases surrounding the stoves. The water in the reservoir becomes heated by the circulation of the water through these pipes, the cold current descending by one, and the heated current ascending by the other. The air, after leaving the bellows, is conveyed by pipes through the cistern, and is thus exposed to the heat of the water; from hence it proceeds into a channel which conveys it throughout the hospital. During its passage through the reservoir, it acquires that degree of temperature which becomes requisite for the comfort of the patients, and which is regulated by simply supplying the stoves with more or less air for their consumption, the heat rising or falling accordingly. The sensation of the air, as it quits this apparatus, is most agreeable; it has none of the desiccating, mordant character of hot air in general; but it has a warm and balmy feel, which is quite a luxury on a cold day. There is a little recess in the wall, which forms a part of the hot-air channel, and is entered by a small door, in which I would recommend any one who has been made cold and peevish by a keen north-easter to stand for a few minutes, and he will find both temper and temperature to be rapidly restored to their equilibrium. Such is the anatomy of the very excellent lungs of the Consumptive Hospital. It is curious that what we may designate its digestive organs are the next in order, so that we proceed hence into the kitchen.

Much ingenuity has been exercised in this department also; and, totally apart from its gastronomic attractiveness, the kitchen has charms for the machinist of no common order. A very large fireplace, with its auxiliary ovens and hot closets, occupies one side of the room; near it is a variety of apparatus intended for steaming joints, &c. Four large saucepans for fish, vegetables, &c. occupy a small bench, and are connected with the steam-pipe by four stopcocks, by means of which the steam, when requisite, can be turned on to each. At another side of the kitchen is an arrangement of soup caldrons, labelled with the enticing announcements, 'Beef-tea,' 'Mutton-broth,' 'Arrowroot,' 'Coffee,' 'Chocolate,' 'Hot Milk,' &c. The contents of these are boiled by jets of steam being blown into each, which is both an economical and a very advantageous method. Two water-pipes, on swivel-joints, supply each caldron

with water when requisite. The kitchen culinary apparatus is supplied with steam from a small self-feeding steam-boiler, which, with its furnace, forms one side of the adjoining scullery. At one corner of the kitchen is the provision loft, a kind of well, up which the provisions are wound to the respective wards. On the whole, this kitchen, though not a very large one, is among the most complete of its kind, and is really a very brilliant and formidable affair, more particularly when at full work; and at that time its steaming caldrons, roaring fires, and bubbling pots, are calculated to impress the visitor's mind strongly with the idea that he is rather in some busy manufactory than simply in a mortal kitchen. I felt more than half-inclined to think it no bad thing, after all, to be an in-patient here; and I am free to confess that the bountifully-stored larder beyond did not form one of the least elements in this impression. The remainder of the basement is occupied by the out-patient department, the dispensary, physicians' rooms, &c. From hence up stairs.

The ground-floor is arranged into a number of moderate-sized wards, each distinguished by its appropriate title. This plan appears to me much preferable to the ordinary method of arranging the wards of an hospital into long, dreary, gaunt rooms, where dozens of beds form the eternal melancholy perspective, and where two or three deaths are certain to occur every week. Here each ward contains but five or six inmates, who may live in each other's society perhaps for months, unterrified by the forced contemplation of the frequent visits of the Great Destroyer, and who can congregate round the fireside, and thus, with some measure of success, beguile away the long and dull hours of their confinement. The female wards are upon this floor. A day-room, in which the stronger patients sit, where they read, and write, and chat, forms one portion of the extremity of the wing, and the pretty temporary chapel has been formed in a corresponding room at the other end. Between these two extremities is a long passage, well warmed by the ventilating apparatus, and forming an excellent in-door promenade. A corresponding one is upon the upper floor. Here the patients take that degree of exercise which is so beneficial for them, and without a risk of a cold draught, or of the thousand accidents of surly English weather. These passages are lighted with the gas apparatus invented by Professor Faraday—a word or two on the principle of which will exhibit to us another feature in the admirable ventilating arrangements of the hospital. To the casual observer, the Faraday gas-light presents, in the appearance of its mechanism, nothing striking: it is a handsome, massive-looking, pendant light, but apparently nothing more. The light burns in a small semi-globe of glass, which is surrounded by one of larger dimensions, on the top of which is placed a piece of talc, surmounted by a thin copper plate. The arrangement is such, that the air to feed the flame enters in the centre of the inner glass, then passes over its upper margin, and not being able to escape at the top, by reason of the copper plate which closes the mouth of the outer globe, it is turned down, and is drawn away by a tube which opens internally all round the bottom of the outer glass shade. The foul air is thus carried away out of the globe, and is conveyed by this tube up the central column into an air-shaft, which is conducted to the roof, and there discharges its contents. The principle, in short, is just that of the down-draught stoves seen in many of our tradesmen's shops: the tube forms an inverted air-siphon. To set the current in motion, a small central burner, which heats the column, is first lighted; afterwards the heat from the gas flame gives the air an ascendancy generally sufficient to perpetuate the up-current while the gas is a-light. By this ingenious contrivance, the foul air from the gas-light is completely cut off from escaping into the building; and by a power which operates, so to speak, upon itself, it is compelled to cast itself out of the hospital altogether.

Along one of the sides of these passages run skirting-

boards, in which slits are cut at the top and bottom. If the hand is held over these apertures, a constant, soft, and warm stream of air is felt to pour out from them. A similar skirting forms part of the sides of every ward, and of every room on the ground and upper floor. These apertures are in connection with the hot-air channel from the apparatus first described, which, in fact, runs along and ramifies throughout the entire building. Each ward or room is supplied with one or more regulators, in the shape of a movable slide, which must be raised or depressed if the amount of air poured out requires alteration. We have seen the entrance of air into the hospital; we have just noticed its distribution; and if we enter into any one of the wards, we shall witness its mode of exit from the structure. Each room in the building is provided with that simple, but immensely useful invention, the balance-valve chimney ventilator. By its means there is a constant change of the air of the wards, and indeed of the air generally; the warm, fresh air enters at the floor, fulfils its office, and escapes by these valves at the ceiling. Thus a supply of pleasant fresh air is constantly insured to the inmates.

A good library, containing upwards of two hundred volumes of an instructive and entertaining character, is open for the use of the patients. The number of wards at present occupied is twelve; the number of patients sixty; but there is room for a larger number in the building as it at present stands, a contracted state of funds being the only obstacle.

In conclusion, I cannot end my visit to the Hospital for Consumption without offering my humble congratulations upon the skill, nor less upon the benevolent humanity, which has opened to the outcast from other hospitals a refuge so noble and so promising of relief to the unhappy victim of pulmonary phthisis. Sixty thousand annually fall under the swoop of this mysterious disease; yet I cannot conceal from myself the hope that, under the increased facilities here offered for its examination, and now known for its detection in an early stage, the day is at hand—and may it come quickly!—when the mystery will be solved, and the disease surrender itself to the superior laws of medical science.

WILLIAM GARDINER THE BOTANIST.

In a recent number we presented a short, and, we hope, not uninteresting account of the late James Crowther, a self-taught naturalist, who lived and died in a humble situation in Manchester. We have pleasure in now making known a person equally ardent in his admiration of the works of nature, and whose whole life may be said to have been a protracted effort to realise, amidst the most untoward circumstances, a mastery of botanical science.

William Gardiner was born of humble parents in Dundee, where he now resides, and his youth was spent in the privations which are the lot of no small portion of the labouring population. Like most Scotch boys, he got some schooling; but the sum and substance of his education was only rudimentary instruction in reading and writing. Yet, with the assistance which these valuable instruments confer, and with an indomitable spirit of perseverance, what may not be achieved? From his earliest years, William manifested an extraordinary love for flowers, and this finally attained the character of an unconquerable passion. In the midst of poverty and neglect, the sight of a flower inspired cheerful thoughts: it was impossible to feel unhappy while nature spread such a banquet of beauty and innocence around! How a boy reared within the sphere of a busy manufacturing town should have had the inclination or opportunity to cultivate a taste for botanical pursuits, might well seem surprising, did we not know that such things are far from uncommon in the lives of men of genius, and that to the enthusiastic mind all impossibilities disappear.

In 1819, when about ten years of age, he was appren-

ticed to an umbrella-maker, in whose establishment he remained five years. At the end of this period he removed to a situation in the shop of Mr G. Robertson, hosier and umbrella-maker, with whom he remained till 1844. To most youths, employment in any line of business furnishes an apparently reasonable excuse for neglecting mental improvement, though, in reality, some of the most distinguished men in Europe are known to have pursued their self-advancing studies in the half hours and hours gained from daily drudging employment. Whether, indeed, it be following the plough, as with Burns, hammering at shoe-leather, as with Gifford, or bottling beer in a cellar, as with Britton, the salient and well-disposed mind can ever find scope for agreeable and improving rumination. Engaged in making umbrellas, and while still a lad, without a friend to direct or encourage, William Gardiner continued to give a share of thought to the works of nature, and every interval of leisure was spent by him in rambles about the fields and hill-sides in the neighbourhood of Dundee. This brought him into acquaintanceship with many plants hitherto unknown to him, and created a desire to distinguish by names the various genera and species, without which he felt the study of nature could be of little substantial value. But in Dundee there were no classes to impart instruction in these subjects, and he possessed no means of procuring works of elementary information. At length he had the happiness to make himself master of a second-hand copy of Berkenhout, and a musty synopsis of Ray's 'British Flora.' These works unfolded the principles of classification, and enabled him, greatly to his delight, to assign names to the floral beauties which had charmed his youthful imagination. Other sources of information afterwards revealed themselves in the library of the Watt Institution, and he might now be said to have vanquished the initiatory difficulties of botanical science.

The neighbourhood of Dundee, however, was exhausted of novelties, and visions of the vegetable treasures which might be seen and gathered among the Highland glens and mountains rose depressingly on the mind. By the kindness of his employer, apparently insurmountable obstacles disappeared. He was permitted opportunities of making excursions into various parts of Perthshire, and these greatly increased his knowledge of the vegetable kingdom. With the view of uniting general utility with personal improvement, he proposed to the Botanical Society of Edinburgh to collect a quantity of alpine plants for that body; and the offer being accepted, he made a regular excursion into the Perthshire Highlands in the summer of 1838. So well pleased were the Society with the collection made for them, that Mr Gardiner was elected an associate member.

This expedition was like the beginning of a fresh existence—the vegetable productions of such high ground as Ben Lawers being quite new to him, and so different from those he had been accustomed to meet in the low country, that his enthusiasm in botanical pursuits was greatly increased. In 1839 he spent several months collecting coast plants for various individuals; and in 1840 he made a collection of alpine plants from the Clova mountains for the Botanical Society of London. Next year the wish for botanical rambling became stronger; but where were the means for its gratification? It now occurred to Mr Gardiner that he might make a kind of business by collecting Scottish plants—those of an alpine character in particular—as many persons seemed to be desirous of possessing properly-arranged specimens, who had no opportunity of gathering and preserving them. In this idea he was not mistaken; for from 1841 to the present time, he has collected and distributed many thousands of botanical specimens to lovers of Flora all over Great Britain. Encouraged by success in this pursuit, he altogether gave up his former business in 1844, since which time he has devoted himself exclusively to the profession of a practical botanist.

In June 1844 Mr Gardiner made an extensive botanical tour among the mountains of Aberdeen and Perthshire, on this occasion visiting the picturesque and sublime scenery around the sources of the Dee, where a vast number of interesting specimens may be gathered. An account of this journey was published by him in 1845, under the title of 'Botanical Rambles,' and affords us an opportunity of presenting a description of the day's work of a botanist—perhaps we should also say a poet—in the neighbourhood of Braemar.

'The white mists were slowly rising up the mountain-sides, disclosing the "land of brown heath" in all its glory, but still chequered here and there with fields of glittering snow, though a warm summer morning sun was showering his rosy beams upon it. Many a gray rock was bathing itself in the orient ray, and many a bristling pine clothed the slopes of the lower hills. The bosom of the vale, through which flowed the lovely Dee, had its fields and meadows mantled with luxuriance; and the village, with its bridge across the murmuring Clunie, its mill, its inns, and its two elegant spired churches, stood forth in all the resplendence of morning.

'It was such a morning as I could have wished

———— "To climb
Some breezy summit's brow sublime,"

but it was yet rather early for many of the alpine plants, and I decided upon botanising some of the lower ground first. The road up Deeside from Castleton winded beautifully among fragrant birchwoods, in which profusion of *Vaccinium Myrtillus*, and *Vitis-Idæa*, *Arctostaphylos Uva-Ursi*, and *Empetrum nigrum*, were intermingled with the heath. Here and there were scattered the starry flowers of the *Trientalis Europeæ*, with little clumps of *Gnaphalium dioicum* and the slender *Melampyrum pratense* *β montanum*; and on rather dry moory spots, the *Pedicularis sylvatica* occurred, with a white corolla. The air was still and warm; the small birds vied with each other which would breathe the sweetest music; the cuckoo "sighed along the vale;" the voices of rooks came from far-off woods, softened by the distance; and ever and anon the ear caught the sound of the "river rushing o'er its pebbled bed;"

"The birch-trees wept in fragrant balm;"

while the graceful squirrel gambolled among their branches; and the bee murmured from flower to flower, and luxuriated in those sunny spots where

"Heath-flowers clustering wild glow with empurpled light."

Now a variegated butterfly would float past on noiseless wing; then a timid dove would peep out from the verdant covert; and at every opening among the trees, or turn of the road, glimpses of beautiful scenery would burst upon and delight the eye, so that my walk was altogether a pleasant one.

'About two miles from Castleton, down the wooded side of the Carr-Hill, runs a little stream, forming near the wayside a tiny waterfall called the "Carr Linn," about which I picked *Hypnum pulchellum* and *stellatum*, *Tetraphis pellucida*, *Bryum crudum* and *ventricosum*, *Hookeria lucens*, and *Jungfermannia albicans*; and the trunks of the birch-trees were abundantly invested with the wide-spreading patches of the elegant *Orthotrichum Drummondii*. Nearly two miles farther on,

"I sought a lonely, woody dell,
Where all things soft and sweet—
Birds, flowers, and trees, and running streams—
'Mid bright sunshine did meet;"

and into that dell the Linn of Corrymulzie poured its sparkling waters. A bridge spanned the stream above, and a zig-zag staircase led down the rocks to the foot of the fall, which, though not of great size, was very beautiful. The rocks were everywhere profusely decorated with flowers, and green moss, and tufted ferns; and a rich diversity of trees—birch, plane, larch, laburnum, and mountain-ash—intermingling their branches and foliage, produced a most pleasing effect. The path

down this delicious dell was like a little paradise. It was so cool, so verdant, so full of beauty and perfume, and the warbling melody of birds so harmoniously blended with the refreshing sound of falling waters, that one felt as if in fabled fairyland. Bright insects were flitting about through the trees, and among others I noticed one that has long been a favourite, the lovely and delicate lace-winged fly, and which recalled to memory a few lines addressed to one several years ago. Those of my kind and good-natured readers acquainted with the insect will, I hope, attribute my introducing them here to the right motive—a desire of awakening pleasurable thoughts and associations.

“TO THE LACE-WINGED FLY.

Bright fly! thou recallest the sweet days of my childhood,
When, wandering alone through the green sunny wildwood,
To pull the fresh cowslips all drooping in dew
And list to the ringdove so plaintively coo,
I there first beheld thee in happy repose—
Thy pillow the half-opened leaves of a rose.
How enraptured I stood! and, in silent surprise,
Viewed thy fair pearly wings and thy bright golden eyes!
And how with delight my young bosom did glow
When thou mountedst aloft to the cherry-tree's bough,
And then, in the wake of a clear sunny ray,
Rose far in the blue sky, and vanished away!

And still, when I visit the woodland's green bowers,
To quaff the rich breath of the gay summer flowers,
And hear the sweet birds in their happiness singing,
Till all the glad echoes with music are ringing,
I love to behold thee on rose-blossom sitting,
Or under the fragrant trees merrily flitting,
Thy beauty—the pleasure thou seem'st to inherit—
Impart a pure ray of delight to my spirit;
For who can be sad while a creature like thee,
With so fragile a form, yet so happy can be?
Does He who has clothed thee in vestments so fair,
And fed thee, and watched thee with tenderest care,
Not watch over all with unwearied eye,
And pour from a fountain that never runs dry
His kindness unbounded on great and on small,
And his power and his love that sustaineth them all?

Then welcome, bright fly! for a teacher thou art,
That can win, with thy gentle persuasion, my heart:
No anger, no threatenings, thou ushest to awe me,
But with love's silken cord dost more easily draw me,
To willingly offer, at gratitude's shrine,
The spirit's pure praise to thy Maker and mine.”

‘Among other plants growing in this dell were *Rubus saxatilis*, *Melica nutans*, and *uniflora Melampyrum sylvaticum* and *pratense*, and abundance of *Epilobium angustifolium*, but not in flower. The *Melampyrum sylvaticum* had some of its flowers of a deep orange colour. *Carex pulicaris* and *pallens* were in perfection on moist rocky banks, and I culled a specimen or two of the beautiful and apparently distinct *Luzula multiflora*. *Bartramia Halleriana* occurred among the rocks in dense tufts, with *Weissia curvirostra*, *Hypnum pulchellum* and *stellatum*, and, where water was trickling, *Weissia acuta* and *Fissidens adiantoides*. There had been here primroses, cowslips, woodroofs, and wood-anemones; but they were all past flowering, and some of the leaves of the latter were covered with *Æcidium leucospermum*. Near the foot of the dell the barberry was flowering, and on its leaves plenty of *Æcidium Berberides*.

‘With a light heart and heavy vasculum I returned from Corrymulzie when the lark was leaving his station in the blue sky, and the brilliancy of day giving place to the softness of evening.’

Next day was devoted to an excursion to the summit of Ben-na-Bourd, the account of which we are likewise tempted to extract. ‘The second sun of July was brightening with his early beams the waters of the Dee, when I left Castleton, with a guide, for the lofty mountain solitudes of Ben-na-Bourd. About a quarter of a mile from the village we crossed the Dee in a boat, ferried over by a picturesque-looking killed boatman, who chained his little bark to a tree on the opposite bank. Passing the boatman's pretty cottage, we entered the fresh woods, where

“Song, fragrance, health, ambrosiate every breeze;”

and after walking on for some time

“Beneath the umbrageous multitude of leaves,”

emerged upon the open heath, and came into Glen Candlic; up which a road for ponies has been formed by Mr Farquharson of Invercauld, the proprietor, and is continued all the way, gradually ascending, to the west shoulder of Ben-na-Bourd. In this wild and solitary glen plenty of deer were seen, and *Epilobium angustifolium* was not uncommon among the rocky banks of the stream. Soon after leaving Glen Candlic, we crossed a stream descending to Glen Quoich, on the banks of which *Arabis petraea* was both in flower and fruit. The ascent now became steeper, and gave ample occupation to our respiratory apparatus; the air was keener, and the sky getting somewhat overcast, threatened us with mist and rain. . . .

‘On reaching the margin of a considerable field of snow, a little below the summit, I came upon large patches of *Polytrichum septentrionale*, and, to my great joy, bearing plenty of capsules! There was a drizzling rain, and the cold was so severe, that my fingers were almost benumbed; but the sight of this rarity was enough to diffuse a thrill of warmth through every nerve, and for a few minutes the effects of the elements were entirely forgotten. I was also gratified with fine specimens of *Dicranum Starkii*, and picked up besides, while my guide laid out dinner on a snowy table, *Dicranum falcatum*, *Trichostomum microcarpum*, *Conostomum boreale*, *Polytrichum hercynicum*, and *Jungmannia scolaris*. My guide and I were soon on the summit, which is nearly four thousand feet above the level of the sea, and about eight miles north from Castleton. Here the mountain breeze was certainly revelling in all its freshness, but rather too “arrowy;” the sky was too murky for allowing the eye to enjoy any extent of prospect, and the ground was too sterile to produce much of interest to the botanist. The contrast between this hard, cold, bare region of clouds, and the soft, warm luxuriance of the vale we had left in the morning, was striking. We had exchanged, in a few hours, the genial glow and beauty of summer for the surliness of winter—the mildness of a temperate, for the rigour of an arctic climate—the cheerful hum of society, for the awful depth of nature's most sacred solitude.

‘We descended by the Corry (from *corrie* in Gaelic, which means a kettle), a large hollow in the side of the mountain, surrounded by a circular range of precipices. In most cases these corries have a lake in them, or a bog, where a lake has formerly been. Where the rocks are micaceous, the ravines, the steep water-courses, and shelves of the corry-rocks, are rich in alpine plants, as is the case among the Clova and Breadalbane mountains; but here, the rocks, being of hard, dry granite, are almost destitute of verdure, and, from their vastness and sterility, present a spectacle of singular sublimity and grandeur. At the base of these wild and wintry cliffs vegetation began again to invite attention, and *Thalictrum alpinum* showed its small fragile flowers. *Gnaphalium rupinum* was abundant, but in general not very far advanced; and in one sheltered spot, small specimens of *Trollius Europæus* were ornamented with their swelling globular flowers of golden hue. The most interesting acquisition on our descent was *Asaules procumbens* in flower. This humble but pretty shrub usually grows on mountain-summits, and flowering early, is rarely seen in that state by botanical tourists, whose peregrinations are generally made towards the end of July, or in August. Its bright rosy corolla is a perfect gem; and to all who admire the beautiful, its contemplation must afford no small share of delight. The only other plant of interest noticed in our descent was *Betula nana*; some clumps of which were spreading over the heaths, but almost destitute of catkins.

‘Crossing Cairn-a-Drochel, we descended to Deeside, were ferried over the river long after twilight had departed, and reached Castleton, tolerably fatigued, late in the evening.’

From these extracts, it will be observed that the various obstacles which impeded the author in his early career have neither prevented him from acquiring a

tasteful and pleasing style of composition, nor stood in the way of pious and poetical communings with nature. Other little works followed 'The Botanical Rambles,' one of which, now before us, entitled 'Twenty Lessons on Mosses,' is a curiosity worth noticing.* Instead of being illustrated by coloured engravings, the work is embellished with real specimens of mosses, dried and gummed on its pages in the manner of a *Hortus Siccus*. This mode of illustration is not new, but it must be allowed to be more effective than that of giving imitations with the press or the pencil. In the present instance, the delicate and varied tints of the mosses are preserved in a remarkable manner, and insure the recognition of the plants in their growing state. By means of this ingenious and interesting little book, any one, without the assistance of a teacher, may acquire a thorough elementary acquaintanceship with the leading tribes of mosses. We may venture to prognosticate that it will be the precursor of many larger and more valuable works on a similar plan, which Mr Gardiner will be tempted to give to the world.

Our story of William Gardiner's uneventful but not useless life, as far as it has gone, may now be said to be told. Stepping beyond the ordinary usage of maintaining silence respecting persons of genius and modest merit till they are in their grave, we have taken some pains to collect these few particulars of a self-taught man of science, who still, we are happy to say, lives amongst us, battling, it may be, with difficulties, but nevertheless inspired with a genuine Scotch spirit of self-reliance, and drawing no small measure of happiness from his perseveringly-conducted botanical researches. If our notice shall be the means of extending a knowledge of his name into quarters where it has not hitherto happened to penetrate, and, above all, if it serve to stimulate youth to undertake the great task of self-culture, the great duty of self-dependence, it will not have been written in vain.

KOHL'S TRAVELS IN DENMARK.

MR KOHL, whose travels through different countries are well known, has just added another work to the already long list—'Travels in Denmark'—a country of which little is distinctly known in England.

Generally speaking, Denmark is not a picturesque country. The peninsular portion, comprising two-thirds of the whole, is little better than an immense sand-bank, two hundred miles long, bound together and kept in shape, as it were, by a backbone of limestone hills running along its length from north to south. The high ground keeps throughout close to the eastern shore, where the country is highly pleasing in parts, with the clear, blue, beautiful Baltic heaving deep in-shore down the narrow inlets, and slumbering in lakes as transparent as Windermere, though of the salt sea brine, under the sea of the hills, which are forested with beech down to the water's edge. Kohl speaks with rapture of the beauty of the beechwoods hereabouts, which, he says, are the finest in Europe, though they are hardly equal to some along the Weser. Some of these tideless lakes are of great extent: one of them cuts right across the peninsula, making an island of Northern Jutland: many of them are tolerably deep close in-shore; and some of the small towns upon them are, in consequence, considerable shipping ports. The other side, along the North Sea, facing England, seems to be a waste of peat bogs, clay, and drift sand, where the sea breaks in a perpetual surf upon a line of shoals, without a single port which can be entered by a ship of size. The dry ground bears nothing itself but buckwheat and rabbits, and is a *terra incognita* to all but the natives, and a few German pedlars, who barter rabbit-skins and goose-quills for the luxuries of life—namely, snuff and red-herrings. Starting from Hamburg, the

great emporium of the north, now rising, like a phoenix, in renovated beauty from its ashes, our traveller finds his way at first into the marsh district of Holstein, and is presently lost in admiration of its beef and butter. Here it is that are reared those great herds of cattle which are beginning to be brought so largely into England. Scarcely three years have elapsed since the late government first legalised their importation, and now every flood-tide bears with it up the Thames or Humber a black, smoking vessel, loaded from stem to stern with motionless captives, wedged together as if by a hydraulic press, and all staring steadfastly forward out of their melancholy eyes, in mute expectation of being within twenty-four hours converted into beef for the English stomachs. Here, too, the Holstein butter is made, which, under the name of Dutch butter, is imported among us to the extent, Kohl says, of a hundred thousand casks; but this is an exaggeration. The production, however, is great, and increasing; and as more and more capital is being brought into it every year, it may fairly be expected to rival the Dutch and Irish butter in the English market. The dairy-farms are very large, with seven or eight hundred cows a-piece in some of the greatest, so that a smaller proportional profit will remunerate the producers—this, too, in a land where there are very few taxes, and the pastures among the richest in the world.

Nothing can surpass the luxuriance of the Holstein meadows, every inch of which has been created by the sea. The great rivers flowing from Northern Germany, the Elbe, the Weser, and the Ems, bring down a huge mass of rich mud, which, in a tideless sea like the Baltic or Mediterranean, would speedily form a delta; but the furious tides, currents, and winds of the North Sea, keep it in suspension till it is finally deposited at a distance, and forms an alluvial belt along the coast. The soil thus progressively created is so rich, as to quadruple the value of the adjoining land, and every possible contrivance is adopted to accelerate its formation. Jetties, constructed of strong beams, driven from twenty to thirty feet deep into the mud, are carried out to low-water mark, each of these of course creating a backwater, in which there is no motion, and all the earthy matter in suspension is able to settle. After a time, a layer of soil rises to the surface, and divers saline plants creep over it, which grow and fatten upon the slime. Plants of a higher order succeed, and contribute, by their decaying remains, to increase and raise the ground; and this process goes on for years, till at last a fine grass springs up in spots, and the cattle are forthwith driven down at ebb-tide to graze. As the tides are apt to be brought violently forward without warning over grass, and all by the westerly winds, it is only the oxen which are risked in these exposed situations, as they fly at once upon the approach of danger to the higher ground, and there make the best fight for their lives that they can, while the sheep, like the stupid, blundering things they are, stand quietly still to be drowned. If the herbage, such as it is, promises well, a subscription is raised, the government engineers are called in, and a dike is carried out at great cost and labour round the outlying portions, which thus, after descending in the shape of mud from the romantic crags and valleys of Bohemia, ends in becoming a constituent part of the kingdom of Denmark.

The country thus created is very curious. From Hamburg to Ripen it extends round the coasts nearly one hundred and fifty miles in length, but of inconsiderable breadth. The whole is a dead flat, without a shrub on it as big as a gooseberry bush, but a veritable paradise to a grazing farmer, being one uninterrupted stretch of fat alluvium, alternately corn and meadow, every inch of which is in the highest degree productive, and is made to produce accordingly. To the right and left, as far as the eye can reach, is a sea of grass, covered far and near with grazing herds—the backs of the cows and oxen in parts just peering above the abundant herbage. Dikes in straight lines to keep

out the sea, and canals in straight lines for drainage, cutting each other at right angles, run endlessly along the horizon. On the tops of these dikes the roads are carried; for a very few days of rain is sufficient to convert the marsh below into a deep tenacious slime, impassable for wheel-carriages. The cost of keeping them up is immense, in some parts as much as a hundred pounds per mile; but it is cheerfully borne, as the sea would else flood the whole country; and the soil is rich enough to pay for all.
